ORIGINAL COMMISSION.

VICTORIA R.

Victoria, by the Grace of God of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith.

To Our right trusty and right entirely beloved cousin William Duke of Devonshire, Knight of our most noble Order of the Garter; Our right trusty and right well-beloved Cousin and Councillor Richard John Earl of Donoughmore; Our right trusty and well-beloved Councillor Edward Henry Smith Stanley (commonly called Lord Stanley); Our trusty and well-beloved Edward Frederick Leveson Gower, Esquire; Our right trusty and well-beloved Councillor Robert Lowe; Our trusty and well-beloved Sir Rowland Hill, Knight Commander of Our most honourable Order of the Bath; Our trusty and well-beloved John Arthur Roebuck, Esquire; Our trusty and well-beloved Thomas Berry Horsfall, Esquire; Our trusty and well-beloved Robert Dalglish, Esquire; Our trusty and well-beloved George Carr Glyn, Esquire; Our trusty and well-beloved Acton Smee Ayrton, Esquire; Our trusty and well-beloved Douglas Galton, Esquire; Our trusty and well-beloved Edward Terrick Hamilton, Esquire; and Our trusty and well-beloved John Robinson M^c^Clean, Esquire, greeting,

Whereas We have deemed it expedient that a Commission should forthwith issue for Inquiry into the charges now and heretofore made for conveyance on the several Railways of Great Britain and Ireland, and whether it would be practicable to effect any considerable reduction in such charges, with a due regard to safety, punctuality, and expedition.

Now know ye, that We, reposing great confidence in your zeal and ability, have authorized and appointed, and do by these Presents authorize and appoint you, the said William Duke of Devonshire, Richard John Earl of Donoughmore, Edward Henry Smith Stanley (commonly called Lord Stanley), Edward Frederick Leveson Gower, Robert Lowe, Sir Rowland Hill, John Arthur Roebuck, Thomas Berry Horsfall, Robert Dalglish, George Carr Glyn, Acton Smee Ayrton, Douglas Galton, Edward Terrick Hamilton, and John Robinson M^c^Clean, to be Our Commissioners for the purposes aforesaid.

And Our will and pleasure is, that you, or any Five or more of you, shall inquire into the charges now and heretofore made by the several Railway Companies of Great Britain and Ireland for the conveyance on their lines of passengers, parcels, goods, minerals, animals, agricultural products, and other merchandise, and into the equality or difference of such charges under similar circumstances, whether as between different Companies, or by the same Company in different cases; and where such inequality or difference exists, you are to inquire whether there are special circumstances which render necessary such inequality or difference; and you are also to inquire into the actual costs of such conveyance, and to compare such costs and charges respectively, if and so far as you shall think fit, with the costs and charges relatively to the accommodation given and service performed on the Railways in any one or more foreign countries; and to report your opinion whether, with a due regard to the progressive extension of the Railway system, it would be practicable, by means of any changes in the laws relating to Railways or otherwise, to effect a more convenient interchange of traffic between the several systems of Railways, and more economical arrangements for the working of Railways, so as to make any considerable reduction in the said costs of conveyance, and in the charges

to the public on account thereof; and more effectually to provide for securing the safe, expeditious, punctual, and cheap transit of passengers and merchandise upon the said Railways with as near an approach as may be to uniformity of charge and equality of treatment for all persons under similar circumstances.

And for the purpose of enabling you Our said Commissioners to make the said inquiries, We do hereby authorize and empower you, or any Five or more of you, to invite all such persons as you may judge most competent, by reason of their situation, knowledge, or experience, to afford you correct information on the subject of this inquiry, to attend before you and to bring with them all such Books, Documents, Papers, and Accounts as may appear to you, or any Five or more of you, calculated to assist your researches in the execution of the trust hereby reposed in you, and to inquire concerning the premises by all other lawful ways and means whatsoever.

And We do command and require you, or any Five or more of you, to report to Us, in writing under your hands and seals, or under the hands and seals of any Five or more of you, as soon as the same can reasonably be, your several proceedings by virtue of this Our Commission.

And for your further assistance in the execution of these Presents, We have made choice of Our trusty and well-beloved William Pole, Esquire, to be Secretary to this Our Commission, and to attend you, whose services and assistance you are to use from time to time as occasion may require.

And We will and command that this Our Commission shall continue in full force and virtue, and that you Our said Commissioners, or any Five or more of you, may from time to time proceed in the execution thereof, and of every matter and thing therein contained, although the same be not continued from time to time by adjournment.

Given at Our Court at Saint James's, the Eleventh day of March 1865, in the Twenty-eighth year of Our reign.

By Her Majesty's Command.

(Signed) G. GREY.

SECOND COMMISSION.

N.B.—*This Commission is substituted for the former one, bearing date the 11th March* 1865.

VICTORIA R.

Victoria, by the Grace of God of the United Kingdom of Great Britain and Ireland, Queen, Defender of the Faith.

To Our right trusty and right entirely beloved Cousin William Duke of Devonshire, Knight of Our most noble Order of the Garter; Our right trusty and right well-beloved Cousin Somerset Richard Earl of Belmore; Our right trusty and right well-beloved Cousin and Councillor Richard John Earl of Donoughmore; Our right trusty and well-beloved Councillor Edward Henry Smith Stanley (commonly called Lord Stanley); Our trusty and well-beloved Edward Frederick Leveson Gower, Esquire; Our right trusty and well-beloved Councillor Robert Lowe; Our right trusty and well-beloved Councillor William Monsell; Our trusty and well-beloved Sir Rowland Hill, Knight Commander of Our most honourable Order of the Bath; Our trusty and well-beloved John Arthur Roebuck, Esquire; Our trusty and well-beloved Thomas Berry Horsfall, Esquire; Our trusty and well-beloved Robert Dalglish, Esquire; Our trusty and well-beloved George Carr Glyn, Esquire; Our trusty and well-beloved Acton Smee Ayrton, Esquire; Our trusty and well-beloved Douglas Galton, Esquire; Our trusty and well-beloved Edward Terrick Hamilton, Esquire; and Our trusty and well-beloved John Robinson M^c^Clean, Esquire, greeting,

Whereas We did, by Warrant under Our Royal Sign Manual, bearing date the Eleventh day of March last, appoint you, the said William Duke of Devonshire, Richard John Earl of Donoughmore, Edward Henry Smith Stanley (commonly called Lord Stanley), Edward Frederick Leveson Gower, Robert Lowe, Sir Rowland Hill, John Arthur Roebuck, Thomas Berry Horsfall, Robert Dalglish, George Carr Glyn, Acton Smee Ayrton, Douglas Galton, Edward Terrick Hamilton, and John Robinson M^c^Clean, to be Our Commissioners for inquiring into the charges now and heretofore made on the several Railways of Great Britain and Ireland, and whether it would be practicable to effect any considerable reduction in such charges, with a due regard to safety, punctuality, and expedition.

Now know ye, that We have revoked and determined, and do by these presents revoke and determine, the said Warrant, bearing date the Eleventh day of March last, and every matter and thing therein contained.

And We, reposing great trust and confidence in your ability and discretion, have nominated, constituted, and appointed, and do by these Presents nominate, constitute, and appoint you, the said William Duke of Devonshire, Somerset Richard Earl of Belmore, Richard John Earl of Donoughmore, Edward Henry Smith Stanley (commonly called Lord Stanley), Edward Frederick Leveson Gower, Robert Lowe, William Monsell, Sir Rowland Hill, John Arthur Roebuck, Thomas Berry Horsfall, Robert Dalglish, George Carr Glyn, Acton Smee Ayrton, Douglas Galton, Edward Terrick Hamilton, and John Robinson M^c^Clean, to be Our Commissioners for the purposes aforesaid.

And Our will and pleasure is, that you, or any Five or more of you, shall inquire into the charges now and heretofore made by the several Railway Companies of Great Britain and Ireland for the conveyance on their lines of passengers, parcels, goods, minerals, animals, agricultural products, and other merchandise, and into the equality or difference of such charges under similar circumstances, whether as between different Companies, or by the same Company in different cases; and where such inequality or difference exists, you are to inquire whether there are special circumstances which render necessary such inequality or difference; and you are also to inquire into the actual costs of such conveyance, and to compare such costs and charges respectively, if and so far as you shall think fit, with the costs and charges relatively to the accommodation given and service performed on the Railways in any one or more Foreign countries; and to report your opinion whether, with a due regard to the progressive extension of the Railway system, it would be practicable, by means of any changes in the laws relating to Railways or otherwise, to effect a more convenient interchange of traffic between the several systems of Railways, and more economical arrangements for the working of Railways, so as to make any considerable reduction in the said costs of conveyance, and in the charges to the public on account thereof; and more effectually to provide for securing the safe, expeditious, punctual, and cheap transit of passengers and merchandise upon the said Railways with as near an approach as may be to uniformity of charge and equality of treatment for all persons under similar circumstances.

And for the purpose of enabling you Our said Commissioners to make the said inquiries, We do hereby authorize and empower you, or any Five or more of you, to invite all such persons as you may judge most competent, by reason of their situation, knowledge, or experience, to afford you correct information on the subject of this inquiry, to attend before you and to bring with them all such Books, Documents, Papers, and Accounts as may appear to you, or any Five or more of you, calculated to assist your researches in the execution of the trust hereby reposed in you, and to inquire concerning the premises by all other lawful ways and means whatsoever.

And We do command and require you, or any Five or more of you, to report to Us, in writing under your hands and seals, or under the hands and seals of any Five or more of you, as soon as the same can reasonably be, your several proceedings by virtue of this Our Commission.

And for your further assistance in the execution of these Presents, We have made choice of Our trusty and well-beloved William Pole, Esquire, to be Secretary to this Our Commission, and to attend you, whose services and assistance you are to use from time to time as occasion may require.

And We will and command that this Our Commission shall continue in full force and virtue, and that you Our said Commissioners, or any Five or more of you, may from time to time proceed in the execution thereof, and of every matter and thing therein contained, although the same be not continued from time to time by adjournment.

Given at Our Court at Saint James's, the Nineteenth day of December 1865, in the Twenty-ninth year of Our reign.

By Her Majesty's Command.

(Signed) G. GREY.

REPORT.

TO THE QUEEN'S MOST EXCELLENT MAJESTY.

MAY IT PLEASE YOUR MAJESTY,

WE, the Commissioners appointed by Your Majesty for the purpose of inquiring into various matters connected with the Railways of Great Britain and Ireland, humbly report to Your Majesty as follows:—

PART I.*

Origin of railway legislation.

1. The railway system of this country had its origin in the enterprise of individuals interested in the several localities; their efforts were not fostered by the Legislature as objects of national concern, but were treated as projects undertaken for the private profit of their promoters, which might be sanctioned by Parliament for the public advantage. In this respect the Legislature followed the policy which had been pursued with great success and benefit to the country for half a century, in allowing private enterprise to develop and manage inland navigation.

Under this system each project was considered entirely on its own merits, and sanctioned by a private Act, which contained the entire statute law applicable to the undertaking.

Earliest Railway Act.

2. The earliest railway or tramway Act was passed in 1801, for the construction of a railway from Wandsworth to Croydon, for "the advantage of conveying coals, corn, and "all goods and merchandise to and from the metropolis and other places." A company was by this Act incorporated under the name of the Surrey Iron Railway Company, with a capital of 35,000*l.*, in shares of 100*l.* each, with power to borrow, on mortgage of its undertaking, a further capital of 15,000*l.*, and with the requisite powers for the management of its affairs.

The tolls for the use of the railway were left to be charged at the discretion of the company within the following maximum rates per ton per mile:—

	s.	*d.*
Dung - - - - -	0	2
Limestone, chalk, lime, and all other manures (except dung), clay, breeze, ashes, sand, and bricks - - -	0	3
Tin, copper, lead, iron, stone, flints, coals, charcoal, coke, culm, fuller's earth, corn, seeds, flour, malt, and potatoes	0	4
All other goods, wares, merchandise, and things whatsoever - -	0	6

All persons were empowered to use the railway at the prescribed rates with horses, cattle, and carriages, subject to such rules as might be made by the company for regulating the construction of the carriages and the convenient use of the railway. The company was authorized to acquire the land necessary for the undertaking, on paying compensation.

Succeeding Acts:

3. From this period new tramways or railways were sanctioned in almost every session for the conveyance of goods at various maximum rates.

Stockton and Darlington.

In 1821 an Act was passed authorizing the construction of a railway from certain collieries near Darlington to the port of Stockton-on-Tees. This short line was destined to have an important influence on railway progress, as it was the first public line on which steam power was used for locomotion, and also the first to carry passengers.

The Act of 1821 provided only for horse power; but on the earnest representation, by George Stephenson, of the advantages that would result from the use of his improved steam locomotive, the promoters resolved to give it a trial, and an amended Act, obtained in 1823, contained a clause giving power to work the railway by means of locomotive engines, and to employ them for the haulage of passengers, as well as merchandise.

* The recommendations and formal expressions of opinion are inserted in Parts I. to VI. in large type, and are collected in Part VII.

It is worthy of remark that in order to check the use of this line for conveying coals for shipping, and to confine it to inland traffic, parties interested in rival ports contrived to insert a clause limiting the charge for the haulage of all coal to Stockton for shipping, to one halfpenny per ton per mile, whereas the rate of fourpence per ton per mile was allowed for all coals transported for land sale.

It was supposed by all parties that it would be impossible to carry coals at such a low rate without loss; but this rate not only turned out profitable, but formed ultimately the vital element in the success of the railway.

In 1824 the number of Acts passed for separate undertakings amounted to 24.

Liverpool and Manchester Railway.

4. In the year 1825, in consequence of the delays and difficulties experienced by the Manchester manufacturers in obtaining their supplies of cotton from Liverpool by water communication, owing to drought in summer and frost in winter, an application was made to Parliament to sanction the Liverpool and Manchester Railway. It was mainly intended for the conveyance of merchandise, but the promoters sought powers in their Bill to convey both goods and passengers by locomotive power. In that year the promoters failed to obtain their Act, but they were successful in the following year, when the Act was passed.

Liverpool and Birmingham, and other Railways.

5. The attention which the Stockton and Darlington Railway had attracted led also, in 1825, to a more extensive proposal, and which was, in fact, the first great effort to supplant the then existing means of communication, by the construction of a railway from Liverpool to Birmingham, intended both for passengers and merchandise traffic; but so little favour did railway enterprise find in Parliament that the Bill then introduced failed, as also did a subsequent attempt made in 1826; the project was then abandoned, and did not become law till 1833. The applications to Parliament to sanction new projects, chiefly for small local lines of railway, continued, however, to increase, and 44 additional Acts had been passed by the end of the session of 1831.

Another great effort was made in the year 1832 to pass a Bill authorizing a railway with locomotive power from London to Birmingham. This was, however, rejected, but the application was renewed in the following year, and the Bill was then passed.

General nature of the early Acts.

6. The Acts by which the earlier railway companies were established followed very closely, in their general scope, the provisions which had been applied to canal companies.

The earliest Canal Acts, however, gave no powers of borrowing. The first Acts in which these powers appeared were passed in 1770. By degrees the borrowing powers of the several companies were restricted to one-third of the share capital.

The promoters were constituted a corporation, and were authorized to raise such money, either by shares or by borrowing, as they required for completing their undertaking; and they were empowered in their corporate capacity to take lands compulsorily, and to charge tolls at their discretion for the use of their railway, within the limit of certain prescribed rates for various classes of goods, as illustrated in the Act of 1801 already quoted.

In the Act for the Liverpool and Manchester Railway, and other subsequent undertakings, a further provision was introduced that if the dividend should exceed 10 per cent. an abatement should be made from the maximum tonnage rates, of 5 per cent. on the amount thereof for each 1 per cent. which the company might divide over and above a dividend of 10 per cent. on its capital.

Railway companies not originally intended to have a monopoly of their lines.

7. In their capacity of owners of a road, railway companies were not intended by Parliament to have any monopoly or preferential use of the means of communication on their lines of railway; on the contrary provision was made, in all or most of the Acts of incorporation, to enable all persons to use the road on payment of certain tolls to the company, under such regulations as the company might make to secure the proper and convenient use of the railway. But no sooner were railways worked on a large scale with locomotive power than it was found impracticable for the public in general to use the lines either with carriages or locomotive engines; and the railway companies, in order to make their undertakings remunerative, were compelled, with the assistance of the persons who had been previously engaged in the carrying trade of the country, to embark in the business of common carriers on their lines of railway, and conduct the whole operations themselves.

Endeavours to secure consistency.

8. The number of Acts passed for new railways from 1832 to 1835 did not average eleven in each year, but 29 Acts were passed in the year 1836.

Both houses of Parliament then deemed it necessary to secure consistency in private Bill legislation.

House of Lords.

9. In the House of Lords it had been the practice, down to that period, to commit local and personal bills, including railway bills, to a certain number of lords named in the order for commitment, and sometimes to all lords present; and when bills were opposed there were added "all lords who shall have been or shall be present this session."

In the year 1835 a committee was appointed which made recommendations, subsequently embodied in the standing orders of the House; the principal of which, so far as relates to committees on private bills, were, that every opposed bill should be referred to a committee of five, to be selected for that purpose by the chairman of committees, assisted by a select committee; that no peer who had any interest was to serve on the committee; and that every member of the committee should attend its proceedings throughout its continuance.

House of Commons.

10. In the House of Commons the standing orders at that time were much less precise in their nature than they now are, and there was no single committee or authority to which the questions that might arise respecting the compliance with standing orders, were referred. In fact they appear to have been generally decided in an inefficient manner by the special committee which sat on the merits of the particular Bill.

In forming these committees the members representing boroughs or counties supposed to be interested in the scheme were placed on the committee, and to these were added a certain number of members representing places at a distance, and therefore supposed to be impartial.

Committee of 1837.

11. To remedy the inconsistencies in the decisions on standing orders which thus naturally arose, the House of Commons in 1837 appointed a select committee, to which were referred all petitions for private bills, and it was the duty of this committee to decide how far the standing orders had been complied with in each case.

This committee was strictly of a judicial character; it consisted of 42 members, who were assisted by four sub-committees, under four separate chairmen, for the greater despatch of business.

The committee had the power to meet when it was deemed necessary so to do, to discuss and settle points of practice. This secured greater uniformity of decision and more consistent practice, than had formerly existed in private Bill legislation.

Railways in 1838.

12. In 1838 there were 490 miles of public railway open in England and Wales, and about 50 miles open in Scotland. The cost of constructing these lines had amounted to 13,300,000*l.*

Committee on Mails. Resulting Act.

13. The growing importance of this means of communication being more appreciated, Parliament, in 1837, appointed a select committee to report what measures it would be just and expedient to adopt, for the purpose of securing to the public the benefit of the conveyance of mails by railroads.

The committee reported in March 1838, and recommended the general provisions which have been inserted in the Act 1 & 2 Vict. c. 98., but added a recommendation that the Post Office should have power to run its own engines on a railway with a train conveying passengers without paying tolls, but subject to payment for services rendered by the Company and accommodation given; the recommendation was not adopted by Parliament.

The Act provided, with regard to all existing and future railways, that the Postmaster-General might require the mails to be conveyed at a speed not exceeding the maximum speed in use on the line, and in such carriages as he desired to be used; and that the railway companies should observe all such reasonable regulations respecting the mails as the Postmaster-General might think fit to make; but the officers of the Post Office were prohibited from any interference with the engine drivers. The railway companies were to be paid a reasonable remuneration for all services rendered by them, to be settled by agreement with the Postmaster-General, or, failing agreement, by arbitration. It was also provided that the decision of the arbitrator should continue in force as against the Postmaster-General, until any change was made in the service to be rendered; but that the railway company should be entitled, at the end of three years, to have the rate of remuneration reconsidered and a new arbitration entered into. The Postmaster-General was also empowered, by giving six months' notice, to determine any existing

arrangement without any compensation, or at any time without notice, on making compensation to the company, unless the notice should have been given in consequence of their default.

Committee of 1840. Resulting Act.

14. In 1840 another select committee was appointed by the House of Commons upon the railway system. It came to the conclusion that the right secured to the public by the railway Acts, of running their engines and carriages on the railways, was practically a dead letter; (1), because no provision had been made for ensuring to independent trains and engines access to stations and watering places along the lines; (2), because the rates for toll limited by the Act were almost always so high as to make it difficult for independent persons to work at a profit; (3), because the necessity of placing the running of all trains under the complete control of one head interposed numerous difficulties in the way of independent traders.

The committee recommended that the executive government should be entrusted with the duty of inspecting new lines of railway, and exercising a general supervision over the manner in which the railway companies used their powers, and added,—

"Your committee in framing these resolutions have been guided by this consideration, that however improvidently Parliament may, in the first instance, have granted to the railway companies such extensive powers, it is now advisable to interfere with them as little as possible, and to limit recommendations to a plan which may ensure the effectual administration of the laws by which each railway company is incorporated. Your committee feel, moreover, that in adopting this course they are more likely to carry along with them the good feelings and the support of the railway companies and their directors, thereby exciting their continued exertions to meet the wants and remedy the complaints of the public. Trusting therefore to the salutary influence which they conceive a superintending authority will exercise over these bodies, your committee have in their recommendations mainly had in view the means of enforcing the law and the power of obtaining such returns as may be required, with the view of observing in what manner these powerful bodies continue to execute the important trusts committed to them, and to enable such superintending authority to recommend to Parliament additional measures if hereafter they should be deemed requisite."

In consequence of the recommendations of this committee, the Act 3 & 4 Vict. c. 97. was passed, by which it was provided that no new railway for the conveyance of goods or passengers should be opened without previous notice to the Board of Trade, and the Board were empowered to appoint officers to inspect all new railways. The Board was also empowered to require, under a penalty, that every railway company should deliver to them returns in whatever form they might prescribe, of the traffic in passengers and goods, as well as of accidents attended with personal injury, and a table of tolls and rates from time to time levied on passengers and goods. All bye-laws already made by companies were to be certified to the Board, and no new ones were to be made without its sanction. The Board was also constituted the guardian of the public interests, being empowered at its discretion to certify to the law officers of the Crown any infraction of the law, and the law officers of the Crown were thereupon required to take the requisite legal proceedings.

The power which had been conferred upon proprietors of land adjoining railways by their private Acts of Parliament, for making junctions, was placed under the control of the Board of Trade, with a discretion to regulate the manner in which it should be exercised.

Act of 1842.

15. In 1842, by the Act 5 & 6 Vict.c. 55., these powers of the Board of Trade were somewhat altered. The notice to be given before opening a railway was confined to passenger lines, and the power of requiring returns of accidents was extended to all cases of accident, whether or not attended with personal injury. Every railway company was also required to convey troops on railways at prices to be settled between the railway companies and the Secretary at War. The Act defined "that no railway shall be considered "a passenger railway if two-thirds or more of the gross annual revenue of such railway "shall be derived from the carriage thereon of coals, ironstone, or other metals or "minerals."

Railways in 1843.

16. The length of railway authorized by Parliament to the end of 1843 amounted to 2390 miles, of which 2036 had been opened for traffic. The authorized capital for these lines amounted to 82,848,081*l.*, of which about 66,000,000*l.* had been raised.

Committee of 1844.

17. At the beginning of 1844 Parliament again directed its attention to the increasing importance of railway communication, and appointed a select committee to inquire into the question.

This committee, in the first place, with a view to obtain a power of control over the railway companies through their special Acts of Parliament, recommended, and the

House resolved, that the following clause should be inserted in all railway Bills passing through Parliament, viz.:—

"And be it further enacted that nothing herein contained shall be deemed or construed to exempt the railway by this or the said recited Acts authorized to be made from the provisions of any general Act relating to such Bills which may pass during the present session of Parliament, or of any general Act relating to railways which may pass during the present or any future session of Parliament."

The committee then proceeded to give the question of railway legislation a more comprehensive consideration than it had hitherto received. They observed that the complaint of monopoly urged against railways was an indication of the benefits they had conferred on the country; as it was not by force of special privileges conferred on them, but by superior accommodation and cheapness, that they had acquired the command of travelling in their district; that railway enterprise should be encouraged; that the country still afforded great scope for the extension of the railway system; that Parliament should "take no step which would induce so much as "a reasonable suspicion of its good faith with regard to the integrity of privileges already "granted, because one of the elements of encouragement to future undertakings was just "and equitable dealing with those already established; and that at the same time nothing "in the nature of a vested interest (by which the committee mean an interest and claim, "over and above positive enactments, for some restraint of general principles in favour of "the party) ought to be recognized by Parliament as attaching to existing railways."

The committee proceeded to recommend that all future railways should be conceded on the conditions of being subject to a reduction of maximum rates and tolls, where, after 15 years from the passing of the Act authorizing a railway, the profits should exceed 10 per cent. for three years, and that similarly every railway should be subject to be purchased by Government. The committee further recommended that railway companies should be required to run one train each way daily for the conveyance of third-class passengers at 1*d.* per mile, and to convey military and police at 1*d.* per mile for privates, and 2*d.* per mile for officers; and they made certain recommendations as to postal communication.

The committee also suggested improvements in conducting the investigation made by the House of Commons into the private railway Bills. They pointed out that heretofore it had not been customary to examine the Bills systematically with reference to public interests, and suggested that the committees on the Bills should consist of five members each, who were not to be interested, either personally or through their constituents, in the Bills they were to investigate; and that all Bills for competing lines should be referred to the same committee; another select committee being appointed early in each session to determine which were Bills for competing lines.

They further laid down regulations as to the extent of the engineering details of proposed lines to be prepared for the consideration of Parliament, and to enable persons whose property would be affected to learn the extent of interference; and suggested that the committee, in deciding upon schemes either competing with each other or with existing lines, should take into account the relative advantage to the public promised by the new schemes or tendered by existing companies.

In order to secure that the public interests in new schemes should be adequately brought forward, the committee recommended that the Board of Trade should make reports upon all railway Bills, which reports should be submitted to the committees on the Bills.

They also recommended that in order to obtain greater uniformity in the general conditions inserted in railway Acts, and to render them more concise, the numerous clauses in railway Acts which were common to all and undisputed should be consolidate into a general Act.

18. In consequence of these recommendations an Act was passed in 1844 (7 & 8 Vict. c. 85.), by which it was provided, that if the clear annual divisible profits should amount to 10 per cent. on the paid-up capital of any railway authorized in that or any subsequent session, at the end of 21 years from the passing of the Act sanctioning the line, the Lords of the Treasury might revise the tolls, fares, and charges, so as to reduce the dividend to 10 per cent.; but such revision was to be accompanied by a guarantee on the part of the Crown that the revised rates should produce a dividend to the company of 10 per cent. for a further period of 21 years. Act of 1844.

The Treasury was also empowered to purchase the railways sanctioned in that or any future session upon terms and subject to conditions which will be noticed more fully hereafter.

The Act conferred upon the public the right to have one train run daily along every passenger line of railway for the conveyance of third-class passengers, with half a hundredweight of luggage for each passenger, at the rate of 1*d.* a mile, to proceed at a speed of not less than 12 miles an hour, and to stop, if required by the Board of Trade, at every station on the line. Further facilities were also afforded for the conveyance of mails and of troops, and for the construction and use of electric telegraphs along the lines of railway by the Government. The powers of the Board of Trade to compel railway companies to comply with the law were extended to all unauthorized proceedings on the part of the railway companies.

The Act altered the definition of a passenger railway to be one "upon which one-third or more of the gross annual revenue is derived from the conveyance of passengers by steam or other mechanical power."

Clauses Consolidation Acts.

19. The provisions of the special Acts passed for each company had year by year become more complicated and numerous. The clauses had gradually increased from 95 in the Act for the Wandsworth and Croydon Railway to 381 in the Act for the Lancaster and Carlisle Railway passed in 1844.

In 1845 Parliament, as recommended by the select committee, passed three Acts containing the clauses which could be made applicable to companies in general, and which it had been usual to insert in the private Acts, and adding such other general provisions as Parliament deemed it desirable to enforce on railway companies.

These general Acts when incorporated by words of reference with the private Acts secure uniformity, but do not preclude committees of the Houses of Parliament from dispensing specially with their provisions in particular cases where, on cause shown, the committees deem it desirable.

The three Acts are as follow—

Companies Clauses Act.

20. 1. The 8 Vict. cap. 16., The Companies Clauses Act.

To regulate the manner in which the company's capital should be raised, and further capital borrowed, the rights of the shareholders, the powers and duties of directors, the declaration and payment of dividends, the keeping and auditing of accounts, and generally the mode in which the company's affairs should be conducted, as regards the shareholders and creditors of the company.

Lands Clauses Act.

21. 2. The 8 Vict. cap. 18., The Lands Clauses Act. To regulate the acquisition of land for the undertaking, either compulsorily or by arrangement, the payment of compensation, the security of title to the land, and the sale of superfluous land.

Railway Clauses Act.

22. 3. 8 Vict. cap. 20., The Railway Clauses Act. To regulate the construction of railways, the temporary use of lands for that purpose, and the acquisition of additional lands for stations, the crossing of roads, the construction of bridges, the screens for roads, the works for accommodation of landowners and the acquisition and working of mines under a railway.

By section 76 the owners of lands adjoining the railway are empowered to make collateral branch lines to communicate with the railway, subject to the above quoted Act of 5 & 6 Vict. c. 55., and also to the following restrictions:—

No branch railway shall run parallel to the railway. The company shall not be bound to make an opening at any place which they may have set apart for any specific purpose, with which such communication would interfere, nor upon any inclined plane or bridge, nor in any tunnel. The persons making the branch are to be subject to such bye-laws as the company may make, and to maintain the junction properly under the direction of the company's engineer.

The Act empowered the company to use locomotive engines and to carry passengers and goods at rates not exceeding the tolls authorized to be taken by its special Act, and to enter into contracts with other railway companies for passing over its line and for the division and apportionment of tolls. The company was entitled to the protection against liability for damage and loss of goods afforded by the Carriers' Act. The tolls levied by the company might be varied, provided the company charged equally to all persons under like circumstances. Any persons might use the railway, with engines and carriages, on payment of the tolls, which were to be exhibited at stations on a board; distance posts or stones were also to be set up at every $\frac{1}{4}$ mile. The Act contained regulations as to the mode of levying tolls and charges, and the company were required to make up an annual account of their receipts and expenditure under distinct heads, to be certified by the directors and audited by the auditors, to be transmitted to the clerk of the peace in each county and to the overseers of the poor in each parish, and to be open to inspection. The

company was empowered to make bye-laws for regulating the use of the railway, to be approved of by the Board of Trade and exhibited at the stations. The lessee of a railway was subjected to the provisions of the Acts under which the railway had been granted to the company leasing it. The Act regulated the use of engines and carriages by persons other than the company. It also made provisions for the settlement of questions by arbitration and regulated the appointment and proceedings of arbitrators and umpires, and the recovery of damages and penalties. It also provided that copies of the special Acts should be deposited with the clerks of the peace and be open to inspection.

Classification of passengers, cattle, and goods.

23. This Act, however, contained no provisions for regulating the classification of passengers, cattle, or goods, or the services to be rendered by railway companies to the public as carriers, or the rates of toll or fares.

These, therefore, continued to be provided for as previously in the special Acts of each company, without any controlling power to ensure either uniformity or system; but in order to afford some idea of the manner in which the tolls and charges were regulated by private Acts at that time, we may insert the following illustration of the usual provisions for this purpose from the Act of the Lancaster and Carlisle Railway, 7 Vict. c. 37. ss. 304 to 315.

"CCCIV. And with respect to the tolls to be levied for the use of the railway, be it enacted, that the company may lawfully demand any tolls not exceeding the following (that is to say,)

1. In respect of the tonnage of all articles conveyed upon the railway or any part thereof, as follows:

For all dung, compost, and all sorts of manure, lime and limestone, and all undressed materials for the repair of public roads on highways, per ton per mile not exceeding one penny halfpenny; and if conveyed in carriages belonging to the company, an additional sum per ton per mile not exceeding one halfpenny:

For all coals, coke, culm, charcoal, and cinders, all stones for building, pitching, and paving, all bricks, tiles, slates, clay, sand, ironstone and iron ore, pig iron, bar iron, rod iron, hoop iron, and all other similar descriptions of wrought iron and iron castings not manufactured into utensils or other articles of merchandise, sugar, grain, corn, flour, hides, dyewoods, earthenware, timber, stones, and deals, metals (except iron), nails, anvils, vices, and chains, per ton per mile twopence halfpenny; and if conveyed in carriages belonging to the company, an additional sum per ton per mile not exceeding one penny:

For all cotton and other wools, drugs, manufactured goods, and all other wares, merchandise, articles, matters, or things, per ton per mile not exceeding fourpence; and if conveyed in carriages belonging to the company, an additional sum per ton per mile not exceeding twopence:

And for every carriage of whatever description, not being a carriage adapted and used for travelling on a railway, and not weighing more than one ton, carried or conveyed on a truck or platform not belonging to the company, per mile not exceeding sixpence, and a sum of twopence per mile for every additional quarter of a ton or fractional part of a quarter of a ton which any such carriage may weigh.

2. In respect of passengers and animals conveyed in carriages upon the railway, as follows:

For any person conveyed in or upon any such carriage, per mile not exceeding twopence; and if conveyed in or upon any carriage belonging to the company, an additional sum not exceeding one penny halfpenny:

For every horse, mule, ass, or other beast of draught or burden, and for every ox, cow, bull, or neat cattle, conveyed in or upon any such carriage, per mile not exceeding threepence; and if conveyed in or upon any carriage belonging to the company, an additional sum not exceeding one penny:

For every calf or pig, sheep, lamb, or other small animal, conveyed in or upon any such carriage, per mile not exceeding one penny; and if conveyed in or upon any carriage belonging to the company, an additional sum not exceeding one farthing.

"CCCV. And be it enacted, that the following provisions and regulations shall be applicable to the fixing of such tolls; (that is to say,)

For articles or persons conveyed on the railway for a less distance than six miles, the company may demand the said tolls as for six miles, in addition to a reasonable charge for the expense of stopping, loading, and unloading:

For a fraction of a mile beyond six miles, or beyond any greater number of miles, the company may demand tolls for such fraction in proportion to the number of quarters of a mile contained therein, and if there be a fraction of a quarter of a mile such fraction shall be deemed a quarter of a mile:

For a fraction of a ton the company may demand toll according to the number of quarters of a ton in such fraction, and if there be a fraction of a quarter of a ton such fraction shall be deemed a quarter of a ton:

With respect to all articles, except stone and timber, the weight shall be determined according to the usual avoirdupois weight:

With respect to stone and timber, fourteen cubic feet of stone, forty cubic feet of oak, mahogany, teak, beech, ash, or fifty cubic feet of any other timber, shall be deemed one ton weight, and so in proportion for any smaller quantity.

"CCCVI. And with respect to small packages and also to single articles of great weight, be it enacted, that the company may lawfully demand the tolls following; (that is to say,)

For the carriage of small parcels (that is to say, parcels not exceeding five hundred pounds weight each) the company may demand any sum which they think fit: Provided always, that articles sent in

large aggregate quantities, although made up of separate parcels, such as bags of sugar, coffee, meal, and the like, shall not be deemed small parcels, but such term shall apply only to single parcels in separate packages:

For the carriage of any one boiler, cylinder, or single piece of machinery, or single piece of timber or stone, or other single article, the weight of which, including the carriage, shall exceed four tons but shall not exceed eight tons, the company may demand such sum as they, from time to time, may think fit, not exceeding sixpence per ton per mile:

For the carriage of any single piece of timber, stone, machinery or other single article, the weight of which, with the carriage, shall exceed eight tons, the company may demand such sum as they think fit.

" CCCVII. And be it enacted, that the toll which the company may demand and receive for the use of the locomotive engines, which they may think proper to provide for propelling carriages on the railway, shall not exceed twopence per mile for each passenger, or threepence per mile for each parcel or package not exceeding three hundredweight, or fourpence per mile for each parcel not exceeding five hundredweight, and one penny per hundredweight per mile for all weight over and above five hundredweight by the ordinary passenger trains, and not exceeding twopence per mile for each animal and fourpence per mile for each ton of goods or other articles by the ordinary luggage trains, in addition to the several other tolls or sums by this Act authorized to be taken, except where the said company may be required to carry such passengers, animals, or goods at a greater rate of speed than the ordinary rate of conveying the same on the railway by the said trains respectively, or with a less load than may be the full load of any such engine so to be employed: Provided always, that nothing herein-before contained shall extend to any case in which any special or extra train may be required and allowed by the said company.

" CCCVIII. And be it enacted, that it shall be lawful for the said company, and they are hereby authorized (if they shall think proper), to use and employ locomotive engines or other moving power, and carriages and waggons to be drawn or propelled thereby, and to carry and convey upon the said railway hereby authorized, or any other railway, all such passengers, cattle, goods, wares, merchandise, articles, matters, and things, as shall be offered to them for that purpose, and to make such reasonable charges for and about such carriage and conveyance as they from time to time determine upon, not exceeding threepence halfpenny per mile for every passenger, including the several tolls herein-before authorized, to be by them charged and received.

" CCCIX. Provided always, and be it enacted, that it shall be lawful for the company to charge any sum which they may think fit in respect of the carriage of passengers conveyed by first-class trains appointed by the company to travel at a speed not being less than twenty-five miles in the hour, including stoppages.

" CCCX. And be it enacted, that every passenger travelling upon or along the railway may take with him his ordinary luggage, not exceeding sixty pounds in weight and four cubic feet in dimensions, without any charge being made for the carriage thereof.

" CCCXI. Provided always, and be it enacted, that nothing in this Act contained shall in any case extend, or be deemed or construed to extend, to charge or make liable the said company further or in any other case than where, according to the laws of the realm for the time being, stage coach proprietors and common carriers would be liable; nor shall anything herein contained extend or be deemed or construed to extend in any degree to deprive the said company of any protection or privilege which, either now or any time hereafter, common carriers or stage coach proprietors have or may have, but on the contrary the said company shall from time to time and at all times have and be entitled to the benefit of every such protection and privilege.

" CCCXII. And be it enacted, that all tolls for the use of the railway shall be at all times charged equally to all persons, and after the same rate, whether per mile or per ton per mile or otherwise, in respect of all passengers, and all goods, animals, or carriages of a like description, and conveyed or propelled by a like carriage or engine.

" CCCXIII. And be it enacted, that it shall be lawful for the said company to charge for locomotive or steam power and carriages, and for loading and unloading the said goods, wares, merchandise, articles, matters, or things, and for the use of the stations or other accommodation or services provided or performed by them, such sum or sums, and that either per ton or per mile, or by bulk, measure, number, or admeasurement, or by fixed charges, as they shall think expedient: Provided always, that in whatever way the said charges are made by the company hereby incorporated, or charges of the same description by any other company or party with whom the company hereby incorporated may enter into any contract or arrangement pursuant to the provision herein-after contained, they shall be made equally to all persons in respect of all animals, and of all goods, wares, merchandise, articles, matters, or things of the same description and quantity, and conveyed or propelled by a like carriage or engine passing only over the same portion of and over the same distance along the railway by this Act authorized (and also any other railway), and at the same speed and in the same direction, and in the same class of train or carriage, and in all other respects under the same circumstances, and in respect of all accommodations of the same nature afforded in respect thereto; and no reduction or advance in any of such charges shall be made partially, either directly or indirectly, in favour of or against any particular company or person; but the said company shall not be compellable to charge after the same rates per mile or per ton, or in the same manner for long as for short distances, or for goods or passengers carried to or from places beyond their own line, as for goods or passengers carried on or along their own line.

" CCCXIV. Provided always, and be it enacted, that in the event of the said railway being let on lease to or becoming the property of any other railway company or companies, it shall be lawful for the said company or companies, being lessees, to demand and take rates and charges of less amount in respect of passengers or goods conveyed by them on the said railway, and which shall also be conveyed by them on their own or any other railway or railways, or any part thereof, than the rates and charges which may at the same time be demanded by them in respect of the conveyance of passengers, and of the same description of goods, passing only on their own or such other railway or railways, or only on the railway hereby authorized (as the case may be).

"CCCXV. And be it enacted, that the company shall not at any time demand or take a greater amount of toll than the company are by this Act authorized to demand; and upon payment of the tolls from time to time demandable all persons shall be entitled to use the railway with engines and carriages properly constructed as by this Act directed, subject nevertheless to the regulations to be from time to time made by the company by virtue of the powers in that behalf herein conferred upon them."

Act of 1845.

24. In 1845 Parliament passed an Act prohibiting the sale, lease, or transfer of any railway except under the provisions of a special Act of Parliament.

Gauge Commission and Act.

25. Meanwhile the system of parliamentary legislation had permitted a diversity in the gauge of railways to come into existence. So long as the railways were detached from each other no inconvenience had resulted therefrom, but when the two gauges met at Gloucester the attention of the public was directed to this evil, and in 1845 an address from the House of Commons was presented to Your Majesty praying for the appointment of a Royal Commission to inquire whether a uniform gauge should not be prescribed. The Royal Commission appointed thereupon reported in 1846, and concluded with recommending that uniformity should be obtained by altering the broad to the narrow gauge.

The Gauge Act was founded upon this report and passed in 1846. This Act did not fully adopt the recommendations of the report, but only defined the districts to which the broad gauge was to be limited, and rendered it compulsory on all railway companies in other parts of Great Britain to adhere to the narrow gauge of 4 feet 8½ inches, unless Parliament should, in the special Act of a company, otherwise define the gauge. In Ireland, a special gauge was enforced as we shall mention hereafter.

Standing orders.

26. The large number of railway Bills which had been brought forward in 1844, 1845, and 1846 had occasioned so much pressure on the general committee on standing orders, originated in 1837, that the sub-committees were discontinued, and examiners of standing orders were appointed in their stead.

It may be well here to recall the fact that the standing orders committee of 1837 was assisted by four sub-committees, each of which had its own chairman. These sub-committees decided whether each private Bill had or had not complied with standing orders. Their reports went to the standing orders committee to decide whether the standing orders might or might not be dispensed with in the particular case. The four chairmen of sub-committees were ex-officio members of the standing orders committee, which therefore had the benefit of their advice. When the examiners were substituted, the committee lost this benefit.

First Commons Committee of 1846.

27. In 1846 a committee was appointed by the House of Commons to consider the principle of amalgamation as applied to the railway and canal Bills then under the consideration of Parliament. They recommended in their first report,

"First, that general powers of granting or accepting a lease or sale of a railway or canal, or of otherwise merging the independence of one company in another not named, should not be allowed to be inserted in any Bill.

"Secondly, that the same rule be applied to all Bills which contain clauses enabling the companies to lease or sell their tolls or works to any one of a number of railway companies therein specified.

"Thirdly, that a clause be inserted in each Bill subjecting all the parties involved in it to all general Railway Acts.

"Fourthly, that in all instances in which railway companies propose to take powers of amalgamation, the rates and tolls of the amalgamated companies should be subjected to revision."

In their second report they made the following general remarks on the subject:—

"The general conclusion, therefore, to which your committee have come is, that it would not be politic altogether to refuse the sanction of Parliament to the amalgamation of railways with canals. They would, however, strongly impress upon the attention of the committees to whom Bills, whether for the amalgamation of canals with railways, or for the conversion of canals into railways, may be referred, that a most searching inquiry should be instituted into the merits of each case; and that their sanction should be given only in those instances in which it shall have been clearly proved that the amalgamation can be effected without prejudice to the public.

"They venture to submit the following points as deserving of consideration in the case of all such Bills:—

"1st, the imposition of a low scale of tolls and charges upon all parties to the scheme. It should be borne in mind, that in the case of canals the scale of tolls is of much greater importance than in that of railways; for as, in most instances, the public are themselves the carriers on canals, they are more interested in the tolls than in the general charges. Subject to this observation, your committee refer to the suggestions with respect to tolls and charges contained in their former report, and which they consider equally applicable to the amalgamation of railways with canals.

"2ndly, strict regulations should be made for maintaining the canals in an efficient state of repair, and for securing a proper supply of water.

"3rdly, power should be expressly secured to the public of carrying passengers and all kinds of goods and merchandise on canals.

"4thly, the privilege of making bye-laws should be subjected to a careful revision.

"Many of the canal companies exercise much power in this respect. They are authorized, for instance, under these laws, to suspend the navigation of the canals for various purposes, and during uncertain periods; and though this power may be innocuous so long as it is exercised by a party directly interested with the public in the limited exercise of it, it is obviously one which may be used with great and detrimental effect to fair competition, by parties so disposed.

"5thly, in cases of the conversion of a canal into a railway, care should be taken that no district is deprived of efficient means of general communication, and the company should be compelled to afford due facilities of access to canal companies and other parties who may be affected by the change.

"After mature consideration, your committee have come to the conclusion that it is absolutely necessary that some department of the executive Government, so constituted as to command general respect and confidence, should be charged with the supervision of railways and canals, with full power to enforce such regulations as may from time to time appear indispensable for the accommodation and general interests of the public."

Lords Committee of 1846. Second Commons Committee of 1846.

28. In 1846 also a committee of the House of Lords was appointed to consider whether a uniform system of management could be enforced on railways; how the expense attendant on obtaining Acts of Parliament could be diminished; and whether legislative measures could be framed to protect individuals from the injury they sustained from railways passing through their property, so as to relieve them from being subjected to the expense of opposing Bills in Parliament: a committee of the House of Commons was also appointed to consider whether conditions could not be embodied in railway Acts, better fitted than those already inserted, to promote the interests of the public.

These committees concurred in recommending the appointment of a department of the Government which should make preliminary investigations into all railway schemes, and be charged with a general control and supervision of railways.

Commissioners of Railways, 1846. Bill of 1847.

29. An Act was passed in consequence in 1846, establishing a Board of Commissioners of Railways, to whom the powers possessed by the Board of Trade were transferred.

At the time of the appointment of this board it was intended that these powers should be extended in the sense of the recommendations of the committee; and the whole subject of railway legislation was referred to the commissioners in order that a bill might be introduced in the ensuing session of Parliament for the regulation of railways, and for defining the powers which should be vested in the commissioners.

This Bill was accordingly introduced in 1847. It proposed to regulate future applications to Parliament for new lines by making it incumbent on the promoters of a railway to apply to the commissioners in the first instance for powers to survey their intended line, depositing at the same time an adequate sum for payment of expenses of survey, not exceeding 500*l.* per mile. After the survey the promoters were to set out the line on the ground, either by means of a furrow or stakes, and mark upon posts set up at intervals the intended height of the rails above or below the ground, so that proprietors might clearly see how their property was to be affected by the proposed line; and where objections were entertained by the proprietors as to the precise course of the line a means was afforded by the Bill to enable the projectors and proprietors to come to an equitable arrangement as to deviations or alterations.

The projected line when laid out was to be reported on by an officer of the commissioners of railways, and the final plans for submission to Parliament were to be deposited with the commissioners on or before the 31st July next before the session of Parliament in which the promoters intended to apply for powers to construct the railway.

The commissioners were to report to each house of Parliament upon the engineering merits of the Bill, to show the proposed tolls, fares, and charges, and to compare them with those on lines connected with the proposed line; to report also on the proposed accommodation to be afforded to the Post Office: and upon any proposed union with, or purchase of, other undertakings.

The Bill empowered the commissioners to examine into compliance with the standing orders of the Houses of Parliament. They were to cause the inspection of all new lines. They also took powers to call for returns of tolls and charges actually levied by railway companies, and railway companies were to publish at the stations either the whole of their tolls and charges or such portions of them as the commissioners might direct. The companies were not to raise these tolls and charges without 15 days' notice. The commissioners were to report annually to Parliament upon the tolls, fares, and charges actually taken by railway companies, and to direct the attention of Parliament to irregularities or discrepancies, or cases of excessive tolls, or to any other matters relating to the tolls, fares, and charges which, in the opinion of the commissioners affected the public interest.

The times of running trains were not to be altered without fourteen days' notice, and the companies were to register the actual times kept by trains at any stations ordered by the commissioners, and to suspend for public inspection, if required, a registry of the time kept by the trains for the previous week at such stations; and the commissioners were to report to Parliament annually upon the regularity or irregularity of trains. They were also to regulate "cheap trains."

The Bill proposed to modify the existing law as to the conveyance of military and police, as follows:—

"For every commissioned officer, two-thirds of the fare for the time being charged by such company for passengers travelling in carriages of the same class as that in which such officer shall travel."

"For every sailor, soldier, marine, private of militia, or police constable, or the wife, widow, or child of twelve years of age and upwards, of any such sailor, soldier, marine, private of militia, or constable, two-thirds; and for every such child of three years of age and upwards, but under twelve, one-third of the fare for the time being charged by such company for passengers travelling by the cheap trains of such company."

"For such children under three years of age no charge shall be made."

"For every ton of baggage, stores, arms, ammunition, and other necessaries, except gunpowder and other combustible matter, twopence per mile, the assistance of the military or other forces being given if required in the loading and unloading thereof."

"For gunpowder, and other combustible matters, such reasonable sum as shall be demanded by the railway company, but subject nevertheless to be reduced, and the excess, if any, repaid by order of the commissioners, if they so think fit, on complaint being made to them."

The commissioners were to settle disputes between railway companies having termini or portions of line in common. They were also to obtain returns of traffic and of accidents from the railway companies, and were empowered to call for such other returns as they might think fit of fares, charges, receipts, expenditure, regulations, general proceedings, and management, and to inspect the books and documents of the railway companies.

The expense of inquiries was to be defrayed by the railway companies.

Byelaws were to be approved by the commissioners; and, during the construction of a railway, they were empowered to require the company to provide police for protection of districts.

We have been thus particular in describing the provisions of this Bill, because it shows the extent of control which the Government of that day deemed either advantageous or desirable. It was in fact limited to inquiry and publicity.

The Bill, however, did not meet with the approbation of the House of Commons, and was withdrawn on the second reading. In 1851 the Board was abolished, and its powers and duties were retransferred to the Board of Trade.

30. The profitable returns afforded by the earlier railways having attracted in 1844 and subsequent years a large amount of capital, competing lines had been proposed, either by new or by existing companies, to most of the important centres of population. Legislation in 1844, '5, '6, and '7.

The Legislature had, as the report of the Committee of 1844 shows, sanctioned many such lines on the ground of competition, assuming that the remedy for the evil consequences of any monopoly which a railway was considered to possess on its own line was to be obtained by affording a competing line.

The number of Acts for new lines of railway and for alterations or extensions of the powers of existing companies, which had been 57 in 1844 for 805 miles of railway, with power to raise 20,500,000*l.*, rose to 120 in 1845 for 2,700 miles of railway, with power to raise 59,479,500*l.*, and reached 270 in 1846 for 4,538 miles of railway, with power to raise 132,617,368*l.*, and 190 in 1847 for 1,354 miles of railway, with 39,460,128*l.* of capital. This led to a demand for capital for investment larger than the resources of the country could supply; consequently the public were compelled to retrace their steps. At the end of 1847 an Act was passed for extending the time for making certain railways, and in 1850 another Act for enabling railway companies to give up the powers for proceeding with portions of their undertakings, and to release them from the conditions which had been attached to such powers. And of the 8,592 miles sanctioned in the three sessions of 1845, 1846, 1847, no less than 1,560 miles were abandoned by the promoters under the powers of this Act.

31. To secure a greater uniformity of procedure in the House of Lords, a standing order was passed by that House in 1848, by which the former practice of the House of leaving questions arising out of the compliance with standing orders, to be dealt with by the committee on the bill, was abolished; and a general committee, consisting of 40 peers, was appointed to decide all such questions. Lords' standing order, 1848.

Committee of 1849.

32. The financial difficulties to which the pressure for capital, caused by the rapid extension of railways gave rise, led to the investigation of the accounts of railway companies, and a committee of the House of Lords was appointed in 1849 to consider "whether the "railway Acts do not require amendment, with a view of providing for a more effectual "audit of accounts, to guard against the application of the funds of such companies to "purposes for which they were not subscribed, under the authority of the Legislature."

The committee recommended that a uniform regulated form of account should be prescribed for all railway companies, and that the accounts should be made more explanatory. They proposed that this form should embrace the following particulars.

1st. A full statement of all the parliamentary powers granted for raising money, and showing the undertakings to which they were applicable; the manner in which the money had been raised under these parliamentary powers, showing the nature of securities issued under each Act, with the conditions and rate of interest applicable to each, and the amount of money obtained and arrears; and the balance of parliamentary powers unexhausted.

2nd. A capital account explaining how the money shown as having been raised under the parliamentary account had been disbursed.

3rd. An account of the ordinary income and expenditure of the railway company.

They also recommended separate accounts to be kept for separate branches, and the creation of a reserve fund.

The committee further recommended that the right of inspection by shareholders of the accounts should be unrestrained; that all accounts without exception touching or relating to the receipts or payments of the company should be required to be produced; and that in case of refusal the statutory penalty should be extended from the book-keeper to the governing body; also that the registered list of shareholders and transfer books should be accessible to shareholders.

The committee also recommended that the restriction upon selecting auditors from among the shareholders should be repealed, and that the auditors should be empowered to call for all books and documents of the company necessary to elucidate not only the balance sheet, but the whole financial condition of the company.

The committee further recommended that the Government should name one auditor to act in conjunction with two auditors to be named by the company; and that if the Government auditor differed in opinion from the company's auditors, his opinion should be recorded and published with the accounts for the information of the shareholders.

Bills embodying some of these provisions were introduced into Parliament in subsequent sessions, but they did not become law.

Railway Clearing House.

33. In the earlier period of railways the carriages and waggons of one company did not generally pass from one line to another, and the inconvenience and expense from change of vehicles were very great. Parliament had contented itself with providing in general terms for the use of railways by the public without any preference, and with prescribing rates of toll on very general and various classifications; but when the railway system began to be developed, the necessities of the railway companies compelled them to come to an understanding with one another, upon a more precise and definite basis, adapted to their real position as common carriers over those lines where they came in contact, in order to accommodate the general wants of the community.

For this purpose the chief railway companies created from amongst themselves an association, with a central office in London, to regulate certain questions of interchange of traffic as between the several companies, and to adjust the accounts arising out of the united action of the companies: to settle disputes as to the division of, and to apportion, the receipts from the traffic which might pass over more than one line under agreements made between the several companies; and to keep the records of the movement of waggons and carriages when these might pass off the lines of the company to which they belonged to the lines of other companies. This institution is called the Railway Clearing House. It was first formed in 1847 by the voluntary association of a few of the narrow gauge companies.

The association made regulations for a more complete classification of all merchandise, and for separating the mileage rate for conveyance along the railway from the charges for any service at the stations, or in the collection and delivery of goods, so that a just division of the gross charge made to the public might be effected amongst the several railway companies engaged in the transport of the goods.

In 1850 Parliament recognized the existence of the clearing-house system, by an Act of Incorporation, enabling the body to sue and be sued; and enacted that any railway

company might join the association or retire from it at a month's notice, and that any company might be compelled to retire at the request of two-thirds of the associated companies.

Each company is represented by a delegate; the delegates constitute a committee for conducting the business of the association, with a chairman, secretary, and treasurer.

The committee are empowered to adjust all accounts between the several companies, and decisions by a plurality of the votes of the delegates respecting any matters of account between the companies are final and conclusive. Any balance found due from a company is a debt due to the committee, for the recovery of which a special remedy is conferred by the Act.

The committee is required to keep entries of all its proceedings, which are to be received in evidence in any suit against a company which is a member of the association.

Amalgamations.

34. The earlier railways had been formed by companies owning comparatively short lines. Thus the line from London to Liverpool belonged to three companies. That from Bristol to Leeds belonged to three companies, and great loss of time on the road and inconvenience arose from the want of unity of management, and from disputes between the companies.*

Therefore, partly for economy of management, and partly for the convenience of the traffic, some of the earlier railway companies, whose interests were identified in a through route of communication, obtained powers to amalgamate their lines.

By amalgamation the places in which these united companies were interested increased in number, and as the number of railways increased, they came into competition with neighbouring lines at many more points. It became necessary to buy up rivals, and this led to further amalgamation, which thus became not so much a question of economy in the management of the lines as of offensive and defensive policy.

The extensive amalgamations which took place, whilst they caused a gradual tendency towards an apportionment of the country into districts, had not removed from the companies the desire to increase the area from which they derived their traffic respectively, and hence continual Parliamentary contests went on between the larger companies for lines to penetrate into each other's districts, and between new and existing companies.

Committee of 1853.

35. The railway Bills submitted to Parliament in the session of 1853 proposed such important amalgamations that a select committee was appointed in that session "to "consider the principle of amalgamation as applied to railway or railway and canal Bills

* The inconvenience experienced is shown in the following extract from the Report by Mr. Laing, Secretary to Railway Department of Board of Trade, in 1844:—

"As regards the public, the existence of so many independent companies, subject to no control, has been attended with considerable inconvenience in addition to the evil of high fares. For instance, where a great line of communication is broken up into several links, each in the hands of an independent company, the through passenger is not only exposed to loss of time and inconvenience, but frequently to the pecuniary loss of having either to stay at some stage of his journey for several hours, or proceed by a more expensive class. To take an example, the London and Birmingham Railway Company runs seven mixed trains, or trains with second-class carriages, each way daily; but the Grand Junction Company only runs two mixed trains, of which one leaves Birmingham at 6 in the morning, and another Liverpool at 4.45 p.m., being respectively too late and too early to form links in the through communication by day between London and Liverpool; whilst of the remaining mixed trains, one leaves Liverpool at 6 a.m., which is too early for any passengers arriving that day by steamboats. The extent to which the public suffer by these arrangements may be estimated from the fact that while upon the London and Birmingham Railway the proportion of second and third-class passengers to first-class passengers is as 63 to 37, upon the Grand Junction line it is as 46 to 54. Taking the actual numbers who travelled upon these lines by each class in 1842, this result would appear to indicate that at least 75,000 persons annually who would wish to travel by second or third-class carriages are compelled by the arrangements of the Grand Junction Company to travel by first class. The same thing takes place, though to a less extent, in several other cases where the links of communication are in the hands of independent companies, and especially as regards third-class passengers, who can seldom avail themselves of the facilities of railway travelling *for long distances.*

"This appears to me by far the most important evil inflicted on the public by the existence of so many independent railway companies; but there are also many minor inconveniences resulting from the disagreements of those bodies, and the clashing of conflicting interests. For instance, the public have been for two years deprived of cheap access to the London Bridge Terminus, and of the benefit of low fares on the Croydon Railway, owing to a dispute between the Croydon and Greenwich companies as to the amount of toll to be paid by the former for the use of 1¾ miles of the Greenwich line. The extent of inconvenience to the public may be judged of from the fact that the number of passengers using the Croydon Railway in the course of the year fell off more than 200,000, owing to the dispute and consequent increase of fares, and that the Croydon Company were actually on the point of abandoning their traffic altogether. Another instance is afforded at Preston, where, owing to the disputes between the different railway companies whose lines terminate in that town, separate stations have been erected at a heavy expense, and passengers proceeding through have been compelled to alight and walk 200 yards without shelter from the carriages of one company to those of the other."

"about to be brought under the consideration of Parliament, and to consider the principles "which ought to guide the House in railway legislation."

The committee recommended—

1. Improvements in the means of dealing with railway Bills.
2. General legislation.

In considering the question of railway Bills it showed that the decisions of the committees on the Bills were fortuitous and inconsistent with each other; that it was frequently not the interest of either one party or the other which appeared before the committee to bring out in evidence the whole case, and that a committee unaccustomed to such investigations was unable to push the inquiry further than counsel chose to direct them; and it instanced what had been the result of the legislation on the gauge system, viz., that what Parliament had undertaken to settle by general legislation, Parliament, in compliance with the finding of private bill committees upon the special circumstances of each case, had forthwith proceeded to unsettle.

It proposed as a remedy the institution of a committee of a character more permanent than heretofore, with the object of securing a comprehensive review of all schemes submitted to Parliament every session.

In dealing with the question of allowing competing lines, the committee urged that greater protection should be given to existing interests, upon the ground that an Act of Parliament constitutes an engagement with the promoters on one side and the public on the other; that this principle rightly understood conveys to the promoters no right that their privileges shall be exclusively maintained when they cease to be consistent with general advantage; but that it does imply that the promoters having been authorized by the Legislature to construct expensive works for public use, the resources from which their just remuneration was to spring should not be taken away upon any other than clear grounds of public policy.

The committee also suggested that amalgamation between companies should be discouraged, and that it was preferable to have working arrangements between the companies for the regulation of traffic and division of profits, which would be subject to revision after limited periods; and that running powers should only be conceded where the free transit from one system to another could not be ensured by other means.

The result was the appointment in the session of 1854 of a general committee, from which the chairmen of the several committees on railway Bills were selected, and the Board of Trade was required to report on the several railway Bills so as to point out to the committees any exceptional legislation proposed by the Bills.

These attempts to guide committees have invariably failed, because all committees necessarily look upon the merits of the particular case before them, just as a jury does, and will not act upon principles of general policy as laid down by another committee when the justice of the case before them appears to render a departure from such general principles necessary. Hence, notwithstanding the recommendation of the committee against amalgamation, the three following years saw the amalgamation of the North-eastern lines of railway, the Lancashire and Yorkshire and East Lancashire, and the Great Western with the Shrewsbury lines; and the decisions of Parliamentary committees with respect to competing lines were not more uniform than before.

Traffic Act, 1854.

36. With regard to general legislation the Committee of 1853 recommended that every company should be compelled to afford the public the full advantage of free interchange of traffic from one system of railway to another, and proposed some interference with the management of railways to secure the safety of the public by fixing greater responsibility on the officers of railway companies in respect of accidents than had hitherto prevailed.

Parliament in consequence passed in 1854 the Railway and Canal Traffic Act, which enunciated, more fully than had been done before, the principle that every railway company should afford all reasonable facilities, for the receiving and forwarding and delivery of traffic, upon and from the different railways, and that no company should make or give any undue or unreasonable preference or advantage to, or in favour of, any particular person or company, or any particular description of traffic in any respect whatsoever, and that every railway company having or working railways, which form part of a continuous line of railway or railway communication, or which have the terminus or station of the one near the terminus or station of the other, should afford all due and reasonable facilities for receiving and forwarding all the traffic arriving by one of such railways by the other without any unreasonable delay, and without any preference or advantage, or prejudice or disadvantage, and so that no obstruction should be offered to the public desirous of using such railways.

The Act also provides a summary remedy against railway companies for any violation of its enactments by an application to the Court of Common Pleas in England, and to other corresponding courts in Ireland and Scotland.

By another provision of the Act the liability of railway companies in the conveyance of horses and cattle was limited in amount unless insured, and any special contracts limiting the liability of the companies beyond the restrictions of the Carriers Act were required to be reasonable to the satisfaction of the court, and to be in writing, signed by the person despatching the commodity.

Parliament did not give legislative effect to the recommendation of the Committee of 1853, that greater responsibility should be fixed on the officers of railway companies in respect of accidents than had hitherto prevailed.

Act of 1858.

37. The general prohibition against railway companies leasing their undertakings without a special Act for that purpose was extended in 1858 to all canal companies owning railways, as regards both their railways and canals.

Standing order of 1858.

38. In consequence of the great pressure on private Bill legislation in the House of Commons at the beginning of a session, that House in 1858 agreed to a standing order that it would not insist on its privileges with regard to any clauses in private Bills sent down from the House of Lords which referred to tolls and charges for services performed and are not in the nature of a tax; and since that time the proceedings on private Bills have commenced in either House of Parliament, as may be found most convenient.

Arbitration Act, 1859.

39. With a view to facilitate the settlement of differences between railway companies, an Act was passed in 1859 empowering the companies to submit to arbitration any existing or future differences, questions, or other matters whatsoever, in which they were or should be mutually interested.

Committees of 1858 and 1863. Resulting Acts.

40. The want of uniformity in the decisions of committees on railway Bills was again brought before the House of Commons in 1858, when a select committee recommended that the panel of chairmen should be reduced, if possible, to five. But the large number of private Bills which continued annually to come before Parliament, as well as complaints respecting the length and costliness of the proceedings in contested cases, and of the want of uniformity in the decisions, again led to the appointment of committees in both Houses of Parliament in the year 1863.

Various proposals for some new form of tribunal were brought forward before these committees, but in consequence of the large discretion which must be vested in any tribunal, however constituted, to which the duty may be entrusted of adjudicating on contested private Bills, and the impossibility of having fixed rules for the guidance of such a tribunal, it was considered to be inexpedient for the duty to be performed otherwise than by committees of the Houses of Parliament. As one means, however, of diminishing the amount of private Bill legislation, the committee of the House of Commons recommended the passing of an Act on the principle of the Clauses Consolidation Acts of 1845 for the further consolidation of clauses usually contained in railway Acts, and also an Act to enable new and existing railway companies, on compliance with conditions to be contained therein (such compliance to be certified by a department), to make new lines of railway, with the consent of all parties affected, without application to Parliament; also to give power to two or more companies to enter into mutual arrangements for the working or use of their respective lines for limited periods, and power to raise further capital with preferential dividends, or otherwise for completion of existing lines, or for additional works, the priority of the rights of existing preference shareholders being secured.

The legislation on these questions is contained in the "Railway Companies Powers Act" and the "Railways Construction Facilities Act," 27 & 28 Vict. cc. 120. and 121.

Railway Companies' Powers Act.

41. The first of these Acts enables railway companies to enter into agreements in the following matters:—

The maintenance and management of the railways of the companies respectively, or of any one or more of them, or of any part thereof respectively. The use and working of the railways or railway, or of any part thereof, and the conveyance of traffic thereon. The fixing, collecting, and apportionment of the tolls, rates, charges, receipts, and revenues levied, taken, or arising in respect of traffic. The joint ownership, maintenance, management, and use of a station or other work, or the separate ownership, maintenance, management, and use of several parts of a station or other work. Public notice of the intended agreements is to be given, the Board of Trade having power to inquire into the merits of objections; but in case any railway or canal company objects to the proposed

agreement, and desires to be heard by counsel, the Board of Trade is not to proceed with the agreement, but to leave the parties to apply to Parliament.

Railway Construction Facilities Act.

42. Under the Railway Construction Facilities Act power may be obtained from the Board of Trade to construct a railway when the whole of the proprietors, whose land is required for the purpose, consent to part with it for the undertaking, and when no railway or canal company objects to the project in the manner prescribed by the Act; but this latter provision renders the Act to a great extent inoperative. The promoters of the undertaking, if more than seven, are to be incorporated by the Board of Trade, with power to raise capital by shares or by borrowing to the extent prescribed in the certificate of incorporation.

The company is to be entitled to take tolls and charges within the maximum prescribed in the schedule to the Act, unless varied by the certificate of the Board of Trade. This schedule is the first attempt made by Parliament to reduce the rate of tolls or charges to be made by railway companies to a general system, and will be found at length in the Appendix DS.

Terminal charges.

43. In 1861 the subject of terminal charges, which had been found to be in a very unsatisfactory state, was brought, by the representatives of the railway companies, under the consideration of Parliament; and they proposed that the following clause should be inserted, after the maximum rate clause in each special railway Act.

"It shall also be lawful for the company, acting as carriers, to make a reasonable terminal charge for the accommodation afforded, and service rendered by them in respect of any goods or minerals other than the actual conveyance thereof along the railway; provided always, that such charge shall in no case exceed the rate of 2*s.* per ton for goods, and 9*d.* per ton for minerals, at each terminal station of such traffic, unless the matters to which such charge relates shall remain on the premises of the company more than 24 hours, by the desire or default of the consignor thereof, or shall so remain by the desire or default of the consignee thereof for twenty-four hours (Sunday, Christmas-day, and Good Friday excepted), after notice of the arrival of the same shall have been despatched to the consignee, in either of which cases it shall be lawful for the company to charge an additional reasonable sum for such occupation of their premises and for services performed by them in consequence of such delay; and when the company performs any service with respect to traffic outside their premises, they may charge a further reasonable sum for such service.

"For a fraction of a ton the company may demand the aforesaid terminal charges according to the number of quarters of a ton in such fraction, and if there be the fraction of a quarter of a ton such fraction shall be deemed a quarter of a ton: and small parcels shall be altogether exempt from such terminal charges."

Owing, however, to the opposition of the coal owners, who feared the exaction of the 1*s.* 6*d.* per ton upon coal traffic, and whom the representatives of the companies failed to satisfy, the clause was withdrawn.

In 1865 a Bill was brought into the House of Commons by the President of the Board of Trade, for enacting certain general clauses applicable to railways, and the following is one of these referring to terminal charges.

"In addition to the charges for goods conveyed on the railway specifically authorized by the Special Act, a reasonable charge shall be payable for the loading, covering, and unloading of goods at any station on the railway, being a terminal station in respect of such goods, and for delivery and collection and any other services incidental to the duty or business of a carrier where such services, or any of them, are or is performed by the company. A station shall not be considered a terminal station in respect of any goods unless they are received there direct from the consignor, or are ordered to be delivered there to the consignee."

The Bill was re-introduced in 1866, but it did not become law.

Proposals to regulate working.

44. We may notice here that Bills have at various times been introduced with the object of compelling railway companies to adopt some precise system of working, but they have not been passed. In the last session a Bill of this nature proposed to compel railway companies to adopt a means of communication between passengers and guards and guards and engine drivers of all trains. It proposed that ready and effectual means of communication should be provided from each compartment to the guard, and from the guard to the driver, under a penalty for non-compliance; and it proposed a penalty on every passenger wantonly or mischievously using the means of communication. A select committee appointed on the Bill recommended it should stand over till the next session.

Railway accounts.

45. From this sketch, showing the principal features of the railway system which has grown up under the sanction of Parliament, must not be omitted the mention of two important subjects, which have at various times occupied the attention of committees of the Houses of Parliament.

These are, the question of railway accounts, and the borrowing powers of railway companies.

Parliament has endeavoured to secure a faithful record and account of all the financial transactions of the companies to be kept under the authority of the directors; a power for any shareholder within limited bounds to examine the company's accounts; the periodical exhibition of a balance sheet showing all the capital, stock, credits, and property of and debts due by the company, and giving a distinct view of the profit and loss; the appointment of auditors independent of the directors, but interested as shareholders; and the payment of a dividend out of profits coupled with a prohibition against reduction of capital by means of dividends, and allowing the formation of a reserve fund out of revenue.

These provisions of the law are nevertheless defective in so far that they do not secure an uniform system of accounts. Each company is at liberty to adopt the form it considers most convenient, and to vary that form from time to time. The result is that no adequate means are afforded by which to compare the financial affairs of two railways, or even to compare the accounts of the same railway from time to time. This uncertainty deprives the public of the power of ascertaining the relative condition of different companies; it deprives one company of the means of profiting by the experience of another, and it leaves shareholders without an adequate check on the governing body.

Borrowing powers.

46. As regards the borrowing powers of railway companies, although the power of a railway company to borrow is generally limited by its special Act to one-third of the share capital, companies have continually exceeded their borrowing powers.

In 1844 it was necessary to legalize the large class of securities termed *loan notes*, which they had down to that time issued in excess of their borrowing powers; but it was at the same time provided "that any railway company issuing any loan note or other "negotiable or assignable instrument purporting to bind the company as a legal security "for money advanced otherwise than under the provisions of some Act or Acts of "Parliament authorizing the railway company to raise such money and to issue such "security, should, for every such offence, forfeit to Her Majesty a sum equal to the sum "for which such loan note or other instrument purports to be the security." It is to be observed, however, that these provisions do not extend to obligations issued for other considerations than money advanced to the company.

A committee appointed by the House of Lords in 1864 stated that at that time the directors of some railway companies, without consulting the shareholders, and without the knowledge of the statutory debenture holders, had defeated the intentions of Parliament, and incurred obligations to a large amount by the issue of a security, termed Lloyd's bonds, for debts contracted for the purposes of the undertaking other than for cash advances, in excess of their Parliamentary powers for raising money; that the holders of these securities can sue upon them, and recover judgment against the companies; and that success in any conflict for priority of claim between them and the holders of statutory debentures would appear to be only a question of more or less diligence

The committee added that they—

"see no reason why railway companies should continue altogether free from the adjusting process to which other trading companies are liable through proceedings in bankruptcy. On the contrary, they are of opinion that the present practice by which the affairs of companies practically bankrupt are patched up by successive Acts of Parliament is injurious to the public, and too frequently of no real benefit to the shareholders. When a company pays little or no dividend on its original capital, the working expenses are often cut down injuriously, danger arises from insufficient service, and the risk of present loss attending any reduction of fares, even with the fairest expectation of future profit, is a bar to liberality of management. For the public advantage, it is desirable that a railway should yield reasonable returns to those under whose control it is placed; and when a company becomes seriously embarrassed, it is expedient that the concern should be transferred to others, under whose management it may be efficiently conducted. The knowledge that such must be the result of mismanagement would probably have a most beneficial effect on the proceedings of directors, and subject the credit which they would be able to obtain to some useful restraint."

The committee recommended compulsory registration of statutory debentures, but saw no remedy against the issue of Lloyd's bonds beyond taking away from the creditors of a railway company the right to seize the stock and stop the traffic of the company; adding that regulations with the objects above mentioned should be framed in a public Act, whereby Parliament would be relieved from dealing with a very troublesome class of Bills.

Railway Securities Act, 1866.

47. In the session of 1866 Parliament accordingly passed the Railway Companies Securities Act, under which every railway company is bound to register half yearly at the office of the Registrar of Joint Stock Companies an account of the loan capital, showing,—

"1. The Act or Acts of Parliament under the powers of which the company have contracted any mortgage or bond debt existing at the end of the half year, or have issued any debenture stock then

existing, or the Act or Acts of Parliament by or under which any mortgage or bond debt or debenture stock of the company then existing has been confirmed, and the Act or Acts of Parliament under which the company have any subsisting power to contract any mortgage or bond debt, or to issue any debenture stock either on fulfilment of any condition or otherwise.

"2. The amount or respective amounts of mortgage or bond debt or debenture stock thereby authorized or confirmed.

"3. Whether or not by any such Act or Acts the obtaining of the certificate of a justice or sheriff for any purpose, or the obtaining of the assent of a meeting of the company, has been made a condition precedent to the exercise of the power thereby conferred of borrowing on mortgage or bond, or of creating and issuing debenture stock.

"4. The date at which such condition has been fulfilled.

"5. The amount or the aggregate amount under the powers of such Act or Acts actually borrowed up to the end of the half year on mortgage or bond (distinguishing them), and then being an existing debt, and of debenture stock actually issued up to that time and then existing.

"6. The amount or the aggregate amount remaining to be borrowed."

And with respect to new borrowing powers the company is to show,—

"1. The Act of Parliament conferring the power to borrow on mortgage or bond, or to issue debenture stock (either on fulfilment of any condition or otherwise).

"2. The amount of mortgage or bond debt or debenture stock thereby authorized.

"3. Whether or not by such Act the obtaining of the certificate of a justice or sheriff for any purpose, or the obtaining of the assent of a meeting of the company, has been made a condition precedent to the exercise of the power thereby conferred of borrowing on mortgage or bond, or of creating and issuing debenture stock.

"4. The date at which such condition has been fulfilled."

The account kept by companies is to be open to all persons interested without payment, and the documents kept by the registrar are to be open to any one on payment of a fee of 1*s*. The Act forbids any company to borrow money under any Act until it has registered the Act which gives the borrowing power.

Railway legislation for Scotland.

48. In the above account of the history of railway legislation we have omitted any special reference to the cases of Scotland, Ireland, and the Metropolis, as it was more convenient to mention them separately.

The legislation for Scotland is identically the same as that for England, except that Scotland has required an exceptional Act for the Railway Clauses Consolidation Act, because of the different administration of law in that country.

An Act has also been passed for authorizing the construction of tramways on public roads. These tramways are to be entirely under the trustees of turnpike roads, they are to form part of the road, and to be supported and maintained out of the tolls or money borrowed on the security of the tolls, but they may be laid down by private parties on statute labour roads.

Railway legislation for Ireland.

49. As regards Ireland the case is different.

The condition of Ireland has at various times caused the attention of Parliament to be directed to the prosecution of Public Works in that country, and a large system of inland navigation has been executed there mainly out of Imperial funds.

In 1836 the question of the construction of railways in Ireland was brought forward by the Government.

Royal Commission of 1836-7.

A Royal Commission was appointed at the end of 1836, in the reign of His late Majesty William IV., and renewed by Your Majesty in 1837, for the purpose of considering a general system of railways for Ireland, and the best mode of directing the development of this new means of intercourse to the channels where the greatest advantage might be obtained by the smallest outlay, with a view to developing the resources of the country.

The commission made a very elaborate survey of the country, and recommended certain trunk lines of railways, but they proposed—

"That every effort be made to combine into one interest and under one management and control the whole of the southern system of intercommunication between Dublin and Cork, Limerick, Waterford, and Kilkenny, and that the northern line by Navan—to Armagh at least—be treated according to the same principle and considered as one concern."

If no large body of capitalists could be found for the undertaking, the commission further stated:—

"That to avoid the evil of partial execution, and to accomplish so important a national object as that contemplated in the completion of the entire system, we may look forward to a certain degree of assistance from the State, as great, at least, as has been given for the encouragement of other public works in Ireland, and on those grounds of policy which we believe have not been disputed, and on which it is therefore unnecessary for us to enlarge."

They therefore recommended—

"1. That Government should advance by way of loan a considerable portion of the amount of the estimates at the lowest rate of interest, and on the easiest terms of repayment, to be secured by a mort-

gage of the works. We think that many landholders may also be found to subscribe towards carrying into effect an object which, in addition to its importance as a national concern, cannot fail to benefit and improve their own properties.

"As a further assistance in filling the subscription, perhaps powers might be given to the counties interested, as well as to corporate towns, to become shareholders to certain amounts; the Government in such case advancing the money on the security of presentments in the usual manner, and the return of such shares being available for the reduction of the county or other rates.

* * * * * *

"2. If these means be rejected, or fail to produce sufficient subscriptions to insure in the first instance the execution of the entire system, we would suggest that the work might still be allowed to go forward, beginning at Dublin, or other fixed terminus, to any other determinate point, such portion, however, not to be considered as an integral line, but only as a part of the general system, and to be continued from that point towards the ultimate intended termini of the several lines and branches as new subscriptions are received. The subscribers to these continuations should be entitled to all the privileges and advantages arising from the whole portion of the line already executed, from the date of the payment of their respective subscriptions, equitably estimated according to the time when each subscription shall be made.

"3. We would further venture to suggest that the Government should undertake either or both of the proposed combined lines, on the application of the counties interested, the outlay to be repaid by small instalments at the lowest admissible rate of interest, and under the provision that in the event of the returns not paying the stipulated amount of interest, the counties shall supply the deficit by presentments."

The Government agreed generally in these proposals, and submitted to the House of Commons the following general resolutions as to the manner in which the recommendations of the commissioners should be carried into effect:—

"That the lines of railway recommended by the Commissioners between Dublin and Cork, with branch to Limerick, should be executed as public works, the management to be vested in the Board of Works, with power to the Treasury to confer such assistance as may be requisite."

"That the usual powers as to appointing officers, entering on lands for survey, &c. be given to them. Detailed plans and sections to be made out by the Commissioners and submitted to the Treasury for approval. Compensation for lands or premises required for these works to be determined by the Commissioners in a manner similar to that laid down in the Act for the improvement of the Shannon. The Treasury empowered to issue exchequer bills from time to time, as may be required for execution of these works, and all other purposes of this Act, not exceeding a given amount.

Accounts of expenditure and reports of progress to be annually laid before Parliament. Commissioners to fix the rates of carriage, and give facilities to parties desirous of making branch lines, subject to the approval of the Treasury. Appropriation of the revenue received: 1st. Maintenance of working of railways. 2nd. Payment of interest at 3½ per cent. on advances; arrears of interest on advances accruing before the works become productive, to be added to the capital advanced, and to bear interest accordingly. 3rd. Repayment of capital at a rate not exceeding 1½ per cent. per annum. 4th. Surplus to be afterwards disposed of in reduction of rates or extension of railways, as Parliament may direct."

These resolutions were adopted by the House, but the question of Government interference was subsequently dropped, and private companies were allowed to proceed as in England and Scotland.

Governme Loans to Irish Rail- ways.

50. The Irish railway companies were, however, treated somewhat exceptionally. They early sought and obtained Government aid for constructing their railways, and under the Acts authorizing the advance of money out of the Consolidated Fund for public works several sums were advanced from time to time to aid the construction of Railways in Ireland. The first of these advances was made to the Dublin and Drogheda Railway Company in 1842.

The distress in Ireland caused by the famine led to increased application for such assistance, in consequence of which Parliament in 1847 authorized the further issue of 620,000*l.* out of the Consolidated Fund to the Great Southern and Western, the Waterford and Kilkenny, and the Dublin and Drogheda railway companies. In 1849 Parliament also authorized the issue of 500,000*l.* out of the Consolidated Fund to aid the Midland Great Western Railway of Ireland Company in completing the line of that company. Other advances have since been made to Irish railway companies amounting in the whole, on 26th May 1865, to 2,364,300*l.*, out of which 1,208,748*l.* have been repaid, and the rest is in course of repayment.

The Midland Great Western Railway Company was assisted by a guarantee, from the baronies through which it passed, of five per cent. upon the capital required for the purposes of its extension from Mullingar to Galway. The railway company were required to render accounts, which were submitted to an auditor named by the Government, and the baronies were called upon to levy rates for payment of the guarantee during many years; but under the provisions of an Act passed in the year 1865 the baronies will be, in October 1870, relieved from all further liability to the guarantee, and the railway company will no longer be required to submit the accounts of this portion of line to Government audit.

In the last session Parliament sanctioned the advance of 500,000*l.* out of the Consolidated Fund to Irish railway companies for a period not exceeding 12 months, to enable them to meet pressing liabilities. This latter loan has been of advantage rather to pay off persons who had incautiously lent their money on the security of existing Irish railways than to increase the amount of railway communication in Ireland.

Irish gauge.

51. Ireland was also treated exceptionally in the matter of its gauge. The Royal Commission recommended a gauge of 6 feet. In 1846, when the Gauge Act was passed defining the gauge of 4 feet 8½ inches for England, except in certain specified districts, the gauge for Irish railways was fixed at 5 feet 3 inches, being a compromise between the two.

The Ulster Railway Company, which had already been opened upon the gauge of 6 feet, as recommended by the Royal Commission, was altered, and the expense of alteration shared between it and the adjacent companies.

Tramways in Ireland.

52. In the Act 23 & 24 Vict. cap. 152. power is given by which any persons, under an Order in Council from the Lord-Lieutenant, instead of an Act of Parliament, may construct tramways, to be worked by animal power, between places where railway communication does not exist, and may take tolls and rates upon them. The grand jury of the county or counties in which the tramway lies considers objections urged by persons whose property would be affected, and after approving or modifying the application passes the question to the Lord-Lieutenant in Council. To him also an appeal lies from persons whose property is affected, and who are not satisfied with the decision of the grand jury. The Board of Works make a local inspection to see if improvements can be introduced, and the Lord-Lieutenant, after hearing the appeals and considering any questions raised by the Board of Works, makes a final Order.

In the session of 1866, a bill was passed by the House of Commons to alter this Act by introducing a power to run locomotives on the tramways, subject to a report from the Board of Trade on questions of safety; but this did not become law.

In respect of the extension of railways in a cheap form, Ireland is thus somewhat in advance of this country.

Metropolitan Railways.

53. With regard to the metropolis, a Royal Commission was appointed in 1846 to inquire into and report upon certain schemes for railways proposed to be constructed in and around the metropolis. The limits within which the inquiries of the commission were restricted were as follows, viz., the Edgeware Road from Oxford Street to the intersection with the New Road; the New Road and City Road to Finsbury Square; Bishopsgate Street to London Bridge; High Street, Borough; Blackman Street, Borough Road, Lambeth Road, Vauxhall Road, Vauxhall Bridge, Vauxhall Bridge Road, Grosvenor Place, and Park Lane.

The Commission recommended—

"That if at any time hereafter it should be deemed advisable to admit railways within those limits, this should be done in conformity with some uniform plan carefully laid down under the authority of Your Majesty's Government, and sanctioned by the wisdom of Parliament; and that under no circumstances should the thoroughfares of the metropolis, and the property and comfort of its inhabitants, be surrendered to separate schemes brought forward at different times, and without reference to each other."

Under the influence of this report all railway enterprise within the prescribed limits of the metropolis remained in abeyance till 1853, when Parliament sanctioned a railway to run under the New Road from Edgeware Road to King's Cross.

A Bill was at the same time proposed for an extension of this line to Farringdon Street. This received the serious consideration of Your Majesty's Government, who came to the following decision, which was announced by Mr. Cardwell, then President of the Board of Trade:—

"Lord Palmerston, Lord Canning, Sir W. Molesworth, and I have considered the scheme of Mr. Pearson very carefully. It does not seem to us that this scheme fulfils those conditions which were contemplated by the second resolution of Lord Canning's Commission in 1846.

"Without, therefore, expressing any opinion against such a scheme for passenger traffic as might answer those conditions, it is not in the power of the Government to give their sanction to the second reading of the Bill this year."

The Bill was in consequence abandoned, and the company prosecuting it dissolved.

Your Majesty's Government, however, not long afterwards determined not to interfere further with metropolitan railways, and in the following session an extension from King's Cross to the Post Office was sanctioned. The two lines became the Metropolitan Railway. In 1854 the company obtained an extension line to join the Great Western London and North-western, and Great Northern railways and the Post Office. The railway after some further modifications was completed in the year 1864.

In 1855 a committee of the House of Commons on metropolitan communications recommended—

"That the different metropolitan railway termini should be connected by railway with each other, with the docks, the river, and the Post Office, so as to accelerate the mails, and take all through traffic, not only of passengers, but in a still more important degree of goods off the streets."

* * * * * *

"That wherever, as for example, in the case of the Metropolitan Railway, works for improving the communication of the metropolis can be carried out by private enterprise, that course be adopted, and your committee consider that most important results may be secured in this way.

"That when the improvements contemplated partake more of the character of a public benefit than of a commercial speculation care be taken by such means as economizing the waste spaces of the river, or opening new streets through poor neighbourhoods, to diminish the cost of the undertaking to the lowest possible point.

"That where the objects specified" in the two foregoing paragraphs "can be more efficiently carried out by the combined agency of railways and street improvements, suggested by Mr. Pearson, it may be desirable to economize expenditure by uniting the two objects under the superintendence of the intended Metropolitan Board of Works, as recommended in the Railway Commission Report of 1846, referred to in the evidence of Mr. Pearson."

The question of railway communication in the metropolis became so prominent in 1863 that a Committee of the House of Lords was appointed at the end of that session to examine the whole question. This committee recommended—

"That in determining the regulations which it may be expedient to apply to railways within the metropolis (herein-after called the Metropolitan Railway District) it is desirable that the limits of the metropolis prescribed to the Royal Commissioners of 1846 should be extended, those limits being the Edgeware Road from Oxford Street to the intersection of the New Road; the New Road and City Road to Finsbury Square; Bishopsgate Street; London Bridge; High Street, Borough; Blackman Street; Borough Road; Lambeth Road; Vauxhall Road; Vauxhall Bridge; Vauxhall Bridge Road; Grosvenor Place; and Park Lane; and that the new limits should be as follows:—Commencing at the Barking Road station of the North Woolwich Branch Railway, thence along that and the Great Eastern Railway to the Lea Bridge Station; thence in a straight line to the Seven Sisters Station on the Great Northern Railway; thence in a straight line to the eastern end of the Hampstead Tunnel of the Hampstead and City Junction Railway; thence along such railway to its junction with the West London Railway; thence in a southern and eastern direction along the West London and West London Extension Railway across the River Thames to the junction with the London, Chatham, and Dover Railway; thence along the London, Chatham, and Dover Railway to the Brixton Road Station, and thence in a straight line to the Lewisham Junction Station of the Mid Kent Railway, and thence in a straight line to the Barking Road Station of the North Woolwich.

"That squares and open spaces in the metropolis should not be unnecessarily taken for the purposes of a railway.

"That it would be objectionable to allow the construction of a great central station in the metropolis.

"That in the construction of any new lines of railway within the Metropolitan railway district, subways, covered ways, or tunnels appear preferable where circumstances admit of them."

* * * * *

"That additional railway communication is needed in the densely populated part of the metropolis; and it is desirable that railway communication where it does not already exist should be established between the various main lines of railway."

* * * * *

"That it would also be desirable to complete an inner circuit of railway that should abut upon, if it did not actually join, nearly all the principal railway termini in the metropolis."

* * * * *

"It would be desirable that an outer circle of railway should be formed within the Metropolitan Railway District, in its course intersecting and communicating with the principal lines of railway north of the River Thames. It might be found convenient to bring this outer circle at certain points into communication with the inner circle.

"The Committee are of opinion that every such system of internal railway communication for the metropolis should be under one management."

* * * * *

In the following session the applications for new lines were so numerous that a joint committee of both Houses of Parliament was appointed to consider the Metropolitan railway schemes. That committee generally followed the recommendations of the committee of the House of Lords of 1863.

In the succeeding sessions, however, fresh schemes have been brought forward and passed, which are to a considerable extent a departure from the suggestions of the House of Lords' Committee of 1863, and which have practically rendered every recommendation of the Royal Commission of 1846 a dead letter.

General result of legislation in encouraging Railways. Statistics in 1865.

54. Whatever may have been the contradictions of the course of legislation which has thus been pursued, it cannot be doubted that it has led to a very rapid development of the railway system, and consequently of the national resources, probably far more rapid than could have taken place under any other conditions, and has induced improvements in the construction and working of the railways which, without the spirit of emulation engendered

by it, must have taken years to attain. Thus whilst in France there is less than $1\frac{1}{4}$ miles of railway, in England and Scotland there are $2\frac{1}{2}$ miles of railway, to 5,000 inhabitants.

Under these conditions the railway enterprize of the country at the end of 1865 had raised by shares and loans 456,421,840*l.* and had opened 13,289 miles of railway. These railways had carried during the year (exclusive of 97,147 season-ticket holders) 251,862,715 passengers, for the conveyance of whom 16,572,051*l.* had been received. The railway companies had received during the same year 19,318,062*l.* for the conveyance of live stock, minerals, and merchandise, or a total of 35,890,113*l.* The working expenses amounted to about 17,200,000*l.*,* leaving a profit of nearly 18,700,000*l.*,* equivalent to 4·1 per cent. upon the money paid up.

The amount of capital which railway companies were authorized to raise by shares and loans down to the end of 1865 was 578,425,763*l.*

During last session 203 Acts were passed, which authorized 47,407,832*l.* to be raised by shares and loans, and 1,063 miles of railway to be constructed; but these are not included in the foregoing summary; hence the entire railway capital sanctioned by Parliament amounts to 625,833,595*l.*, being 169,411,755*l.* beyond the sum expended to the end of 1865.

A deduction must be made from this on account of undertakings which have been abandoned or cannot be carried out, but we are unable to state to what extent.

PART II.

Present state of the law affecting railways.

55. It appears from the above account that the legislation upon railways at the present time consists,—

A.—Of general laws applicable to all companies.

B.—Of special laws applicable to the particular companies.

Principles of general legislation.

56. A.—(1.) The general laws now existing are based on broad principles. One portion of this legislation regulates the constitution and management of the companies as joint stock undertakings; another regulates the acquisition of land, the compensation to be paid for it, the interference with adjacent property and roads in the construction of the railway and its subsequent maintenance; but the more important portion of this legislation regulates the relations between the railway companies and the public who use the railways when made.

Degree of interference with construction and working.

57. (2.) Theoretically, railway companies are free to construct their lines in any manner they choose upon the specified broad or narrow gauge in England, and upon the specified gauge in Ireland, but no railway can be opened for the public conveyance of passengers until one month's notice of the intended opening shall have been given to the Board of Trade; and if in the opinion of their inspector the opening would be attended with danger to the public the Board may postpone the opening for one month, and must forward a copy of the inspector's report to the company. The Board may go on postponing the opening from month to month until their inspector's requirements have been complied with.

After the railway has been opened for traffic the manner of working is left by Parliament entirely in the hands of the railway company; but the Board of Trade is empowered to cause the railways, the engines, and the carriages to be inspected by their officers whenever they think fit, and may, when applied to, make regulations for the safe working of the traffic at the junction of the lines of two companies.

The railway company, in undertaking the duty of carriers, become liable under the common law to compensate persons injured, and under Lord Campbell's Act to compensate the relatives of persons killed by the company's negligence or by that of their servants.

Thus Parliament has relied upon the principle of leaving the responsibility of the safe working of railways with the companies rather than upon giving the Board of Trade the power and duty of interfering in the details of management.

General provisions to regulate traffic.

58. (3.) With the object of securing to the public the free use of the railways, Parliament has enunciated the principle in the Traffic Act that the companies are bound to afford all reasonable facilities for forwarding, delivering, and interchanging traffic, without preference or delay, and that the tolls shall be charged equally to all persons, and after

* These amounts are somewhat uncertain, as the working expenses of some of the companies are omitted in the returns.

the same rate, in respect of all traffic passing over the same portions of railways under the same circumstances.

Parliament has required that distance posts or stones shall be set up at every quarter mile along the railways, and that the tolls authorized by the special Act to be taken, and which shall be exacted by the company, shall be published by being exhibited on a board.

This has been regarded by railway companies to apply only to the tolls leviable for the use of the railway; but it would appear from the context of the Act that Parliament intended that this publication of the charges actually made by the company should apply as much to rates charged where they carried the traffic as to tolls levied upon the engines and carriages of other persons using the lines.

The companies are bound to permit to be carried on their lines all goods except aqua-fortis, gunpowder, lucifer matches, or any other goods which in the judgment of the company are dangerous.

Parliament, however, has not enunciated that the companies are bound to carry the traffic themselves; on the contrary, it has only enacted that when a railway is open any persons may use it with their engines and carriages upon certain conditions, and that the railway companies are themselves at liberty to carry the traffic in their own vehicles; but if they carry it that they may levy tolls not exceeding the amount laid down in their special Acts.

The companies in fact may elect either to carry the traffic and to provide the whole of the engines and carriages and waggons, or to allow traders to provide the waggons themselves, the company merely providing the locomotive power; or they may leave the traders to provide both; but they are not bound to provide accommodation for the waggons or engines at the stations, or otherwise except for the mere transit along the lines.

Under the general Act ample powers are given to the railway companies to control the description and quality of waggons used by traders, and the regulations under which they may be run, so as to ensure freedom from accident; but there is no provision for ensuring that the movements of traders' waggons when used shall be regulated, and delays prevented, with the same degree of care as is practised with the companies' waggons.

The owners and occupiers of land adjoining the railway, and other persons are empowered to lay down branch lines of railway to communicate with the railway for the purpose of bringing engines and carriages to or from or upon the railway, and to make junctions, where it can be done with safety to the public, without injury to the railway, and without inconvenience to the traffic thereon.

With the object of ensuring that engines and carriages of one railway company should be able to pass on to the lines belonging to other companies, Parliament has enacted that the railways in Great Britain shall be on the gauge of 4 ft. 8½ in.; but, inasmuch as before the passing of the Act, the Great Western Railway and its tributaries had been already constructed on the 7-foot gauge, certain specified railways were allowed to be of the latter gauge.

There are at the present time 26 places where the broad gauge joins the narrow gauge, where a transfer of traffic takes place, whilst at the time of the passing of the Act of 1846, Gloucester was the only place.

In Ireland a uniform gauge of 5 ft. 3 in. has been established.

There are three descriptions of traffic which have been strictly regulated by Act of Parliament, viz., the carriage of the poorer class of travellers, the conveyance of the military, and the conveyance of the mails.

Every passenger railway company is obliged to run at least one train each way daily at an average speed of not less than 12 miles an hour, to stop at every station, the carriages to be provided with seats and protected from the weather in a manner to be approved of by the Board of Trade. The fare not to exceed 1*d.* for each mile travelled; children under three years old to travel free, and children between 3 and 12 years old at half price; each passenger to be entitled to carry 56 lbs. of baggage free of charge. The receipts for this description of traffic are relieved from passenger duty.

The railway companies are bound to carry the soldiers and police in covered carriages with seats and adequate space at 1*d.* per mile, and officers in first-class carriages at 2*d.* per mile; also to carry public baggage and stores accompanying them at 2*d.* per ton per mile.

The Postmaster General is empowered to require railway companies to run trains at such times as he fixes, and at such speed, not exceeding 27 miles per hour including stoppages, as the inspector of the Board of Trade certifies to be safe, stopping at such

stations as the Postmaster General requires, upon payment of a sum to be fixed, in case of difference, by arbitration. The Postmaster General may also send guards with mail bags by any train, on payment of ordinary passenger fares; but this has been held by the law courts not to allow the guards to discharge their bags and receive others at the various intermediate stations.

With the object of developing the use and the extension of railways, Parliament has passed Acts for establishing the railway clearing system, for enabling railway companies to enter into working and traffic arrangements, and for enabling railways to be constructed without the necessity of an application to Parliament, in cases where such construction is not opposed by the persons whose land is taken, or by adjacent railway or canal companies.

Provisions for purchase by the State.

59. (4.) In order to prevent any future evil arising from the position which railway companies occupy, Parliament has reserved to itself the right of purchasing the lines after the expiration of a definite period, if it should consider that the public interests require such purchase. Parliament has also reserved a power in certain contingencies of reducing the maximum tolls and rates leviable by railway companies, and has also reserved the right of passing any general railway Act it may deem necessary for regulating the railway system.

Great number of private Acts.

60. B.—The special legislation for railway companies is now comprised in about 1,800 Acts of Parliament sanctioning the construction of new lines from 1801 to the present time, and in about 1,300 Acts modifying the provisions of the original Acts by authorizing the extension of capital, the variation of lines, the construction of additional works, the leasing or amalgamation of lines, the variation of tolls and rates, and the amendment and consolidation of original Acts; so that it has become an extremely difficult task to ascertain the precise law affecting any company, or any particular portion of its lines of railway.

Special clauses.

61. Since the passing of the Companies Clauses, the Lands Clauses, and the Railway Companies Clauses Acts, we believe that they have been very generally incorporated into private Acts, and to that extent the legislation is of uniform character; but in almost every Act sanctioning new lines there are special clauses conferring particular rights or benefits on individuals or other railway companies to carry into effect arrangements which have been entered into by the promoters to avert opposition to their bill.

Clauses governing tolls and charges.

62. The clauses however governing tolls and charges, which have been left entirely to the special Acts, are of a very bald and imperfect character, and are by no means uniform.

There is not only a diversity in the amount of tolls for the use of the line, and in the rates when the company is a carrier, but an imperfect enumeration and often a diversity of classification of the various goods to which the tolls apply. Thus some important commodities are altogether omitted, and the class in which a particular article is placed in the Act of one company is not always the same as that in which the same article is placed in the Act of another company.

In some cases Parliament has taken advantage of the amalgamation of companies to bring all their powers as to rates and tolls into the amalgamation act; this has been done, for instance, in the case of the Lancashire and Yorkshire Railway, and to some extent in the case of the London and North-western Railway, whilst in other cases the toll clauses are scattered through the numerous separate Acts originally obtained by the companies which have since been amalgamated.

For instance, the Midland Railway Company has its power of levying tolls divided over three Acts. In one Act coals are classed in the lowest class with a maximum toll of 1*d.* per ton per mile; in another Act they are classed in the second class with a toll of 1½*d.* In one Act grain is classed in the lowest class but one, with a toll of 1½*d.*; in the other two Acts it is placed in the next class but one, with a maximum toll of 2*d.*

In the Midland Railway Acts generally there are four classes for merchandize and minerals; in the Lancashire and Yorkshire there would appear to be eight, in the North-eastern five, and in the London and South-western three.

The London and North-western Railway Company appear to derive their powers from five Acts, in some of which the articles are placed in eight classes, in others in three or four classes.

The Great Eastern Railway Company has five Acts, in some of which the articles are placed in five classes, in others in four classes.

The Great Northern Railway would appear to have its powers for levying tolls and rates contained in nine separate Acts, in some of which the articles are placed in five classes, in others in four classes.

The Great Western would appear to have 13 Acts with toll and rate clauses. In one Act the maximum toll for rod and pig iron and iron ore is $\frac{1}{2}d.$ per ton per mile; in another these articles are placed in another class with a toll of $1\frac{1}{2}d.$ In one Act grain is placed in the lowest class but one with a maximum toll of $1d.$; in another Act it is placed in a class above with a maximum toll of $2d$; and in a third Act the maximum toll is $2\frac{3}{4}d.$ In one Act the articles are divided into eight or nine classes, in others into four classes.

These instances will afford a sufficient example of the nature of the anomalies in the classification of goods and in tolls and rates.

The enumeration is moreover extremely imperfect. One Act enumerates 22 articles, another 98, another 160; the Acts adding at the end of the highest class general words to include all other articles and matters not enumerated in the previous classes.

Terminal charges.

63. In addition to a toll or rate per mile for conveyance along the line, nearly every special Act at the present time enables the companies to make some additional charges for services in connexion with such conveyance, which are varied in their nature.

In the earlier Canal Acts carriers were allowed to pass over distances of one-eighth of a mile, only paying for one-eighth of a mile. In the session of 1841 the Acts not only limited the tolls for the use of the railway, but also limited the charges which the company might make for supplying carriages and locomotive power. And about the same time the "short distance" clause took the following form, viz.:—

"For articles and persons conveyed a less distance than (six) miles the company may demand, in addition to the tolls and charges, a reasonable charge for the expense of stopping, loading, and unloading."

Thus it would seem that originally the maximum mileage rate for distances beyond six miles was intended to cover all services of loading and unloading, and that this "short "distance" clause was put in as a means of remunerating a company in cases when the traffic was carried so short a distance that the mere mileage rate would not cover expenses of this nature.

Subsequent legislation has modified this view, and Parliament has recognised a charge for services performed at the station in addition to the mileage rate.

The clauses allowing these charges take some of the following forms:—

"It shall not be lawful for the company to charge in respect of the several articles, matters, and things, and of the several descriptions of animals herein-after mentioned conveyed on the railway, any greater sum, including the charges for the use of carriages, waggons, or trucks, and for locomotive power and all other charges incident to such conveyance, (except a reasonable charge for the expense of loading and unloading when such service is performed by the company) than the several sums herein-after mentioned."

In some Acts they have taken the form:—

"A reasonable sum for the loading, unloading, and covering, and for delivery and collection of goods and other services incidental to the business of a carrier, and a further reasonable sum for warehousing and wharfage and for any other extraordinary services which may be reasonably and properly performed by the company."

In more recent Acts the "short distance" clause has assumed the following terms, viz.:—

"For articles or persons conveyed on a railway for a less distance than (six) miles, the company may demand the said tolls as for six miles in addition to a reasonable charge for the expense of stopping, loading, and unloading."

In some Acts of the session of 1860 the clause limiting the maximum rates of charge is followed by a proviso authorizing the company to demand "a further reasonable sum "for collection and delivery of goods and other services incidental to the business of a "carrier where such collection, delivery, and services respectively shall be performed by "the company elsewhere than within the premises of the company."

Later Acts again appear to contain the following form:—

"And with respect to the conveyance of horses, cattle, carriages, and goods, the maximum rates of charges to be made by the company, including the tolls for the use of the railway and waggons or trucks and locomotive power, and every expense incidental to such conveyance (except a reasonable sum for loading, covering, and unloading of goods at any terminal station of such goods, and for delivery and collection and any other services incidental to the business or duty of a carrier, where such services or any of them are or is performed by the company) shall or not exceed the following sums."

In the Great Eastern Railway Act, 1862, 25 & 26 Vict. c. ccxxiii. s. 230, to the usual exception there is added "a reasonable sum for warehousing and wharfage."

In some special Acts which contain the form of proviso in question there is also inserted a clause defining terminal stations in the following terms, viz. :—

"No station is to be considered a terminal station in regard to any goods conveyed on the railway which have not been received thereat direct from the consigner of such traffic, or are not directed to be delivered thereat to the consignee."

It is also to be observed that Acts containing those provisions usually contain the following, viz. :—

"For articles or persons conveyed at a less distance than (six) miles, the company may demand tolls and charges as for (six) miles."

"Nothing herein contained shall be held to prevent the company from taking any increased charge over and above the charges herein-before limited for the conveyance of goods of any description by agreement with the owners or persons in charge of such goods, either in respect of the conveyance thereof (except small parcels) by passenger trains, or by reason of any other special service performed by the company in relation thereto."

Some few companies have a power to charge, in addition to their tolls and charges for loading, covering, and unloading goods, a reasonable sum for the use of stations and sidings.

In the North Staffordshire Railway Act, 27 & 28 Vict. c. 308. s. 19., 1864, there is a provision for settling the terminal charges by arbitration. The clause is as follows :—

"Besides the rates per mile which the company are authorized to charge for conveyance of goods or minerals on their railways or canals, they may charge for such terminal services as are performed by them such reasonable sum only as may be from time to time agreed upon between the company and the person sending or receiving goods, minerals, or other articles of traffic, or, failing agreement, as may be settled by arbitration under 'The Railway Companies' Arbitration Act, 1859.'"

In the Railways Construction Facilities Act the following is the clause for regulating these charges :—

"In addition to the charges in Table III., a reasonable charge is to be payable for the loading, covering, and unloading of goods at any station being a terminal station in respect of such goods, and for delivery and collection, and any other services incidental to the duty or business of a carrier, where such services, or any of them, are or is performed by the proprietors of the railway.

"A station is not to be considered a terminal station in respect of goods unless they are received there direct from the consignor, or are directed to be delivered there to the consignee."

It would thus appear that, although there is great diversity in the clauses of this nature, Parliament now considers that the maximum rate should as a rule cover all the cost of conveyance and use of railways and sidings for the receipt of trucks ready laden, but not the cost of loading, covering, or unloading. Thus, if a railway company provide special means for facilitating loading, covering, and unloading, or allow goods to remain in the stations beyond a reasonable time, they would apparently under their powers and the intentions of Parliament be enabled to charge for such services. But, whatever Parliament may have intended, railway companies seem to have generally interpreted their Acts of Parliament as authorising them to make additional charges for the expense of constructing sidings as well as of working them.

Reduction of tolls.

64. In a few of the special Acts the power conferred upon the Treasury of reducing the rate of tolls at the end of 21 years when the dividend exceeds 10 per cent. has been extended to a lower rate of profit. Thus, for instance, the Act which amalgamates the Great Western, the South Wales, and the West Midland Railway companies (26 & 27 Vict. c. 198. s. 64) limits the rate to six per cent.

Bills to remedy public evils.

65. It may be mentioned here that in some of the earlier amalgamation Acts Parliament inserted a clause to the effect that if any evil to the public interests was found to arise from the amalgamation, the Treasury or Board of Trade had power to introduce a Bill into Parliament to remedy the evil; but this power was never found to be operative.

PART III.

Government purchase of railways.

66. Having thus described the origin and progress of the railway system, we proceed to inquire whether any fundamental change is required in it by the public interests.

It was clearly contemplated by Parliament that it might be desirable at a future time to reconsider the relations of railways to the State, inasmuch as it is stated in the Act of 1844 that it is not intended to prejudge by its provisions the policy of revision and

purchase, but to leave the question open for the future consideration of the Legislature upon grounds of national policy.

As the period of 21 years fixed by that Act for the purchase of railways authorized in 1844 has now elapsed, the proper opportunity for a full examination of the question has manifestly arrived.

67. We will in the first place examine the provisions of the Act of 1844, and the manner in which they could be carried into effect. Act of 1844

The Act provides that after the end of 21 years from the 1st January next after the passing of any Act of the session of 1844 or any subsequent session of Parliament for the construction of any new line of passenger railway, such new line of passenger railway, whether a trunk, branch, or junction line, sanctioned in that or any subsequent session, and whether such new line be constructed by a new company or by an existing company, shall be liable to be purchased for a sum equal to 25 years' purchase of the average annual divisible profits for three years before such purchase, provided these profits shall equal or exceed 10 per cent. on the capital; and if not, the railway company shall be at liberty to claim any further sum for anticipated profits, to be fixed by arbitration.

The company owning such line is to keep and render to the Treasury accounts of the receipts and expenses for the three years, distinguishing such receipts and expenses, if a branch, or if worked in connection with other railways, from the receipts and expenses on such other railways.

It is especially enacted that the option of purchase shall not extend to any railway the construction of which was authorized before the session of 1844. But any railway company subject to its provisions may require that if the Government purchase a branch of their line sanctioned subsequently to 1843, they shall also purchase the whole of the company's lines.

It is declared by the Act that, in order to prevent the public resources from being employed under these powers to sustain an undue competition against any independent company or companies, the powers are not to be exercised by the Treasury until Parliament has by law authorized the guarantee or the levy of the purchase money and determined the manner in which the option is to be exercised.

68. There were 2,320½ miles of railway sanctioned before the session of 1844, which are, therefore, excluded from the provisions of the Act. The following statement shows the companies to which these railways belong, with the length of each. Railways exempted.

Railways authorized by Parliament to the End of the Session of 1843, and which are now open:—

	Miles.	Miles.
Birkenhead:		
Chester to Birkenhead	16	
Bodmin and Wadebridge	14¾	
Bristol and Exeter	75	
Caledonian:	Miles.

Note.—The railways marked thus * being principally used for mineral traffic may perhaps not be considered passenger railways under the Act.

This list includes (with the exception of the Great Northern Railway) the main lines of communication throughout England.

It would therefore appear that if the State elected to purchase the railways, it would never, unless with the concurrence of the proprietors of the lines, become the possessor of the whole of the principal main lines of railway, such as the Great Eastern, London and North-western, Great Western, and London and South-western, but in these cases would become possessor only of numerous lines which (like the Trent Valley) are integral parts of the several systems; nor would the State at the present time become the owner of more than those lines, or parts of lines, or branches which were sanctioned during the years 1844 and 1845. In every succeeding year it would be entitled to take so much of the existing railways as was authorized in the twenty-first preceding year.

Accounts required.

69. It would be very difficult, even if it were possible, to frame accounts to show with any approach to accuracy the receipts and working expenses upon these separate portions of railways so as to form a basis for purchase.

This condition of things is sufficient to account for the Treasury not having required the companies to render any such accounts of receipts and expenses as were contemplated by the Act of 1844.

Supposed financial advantages.

70. The question, however, of Government purchase deserves full inquiry in a broad point of view, and the expiration of the period fixed in the Act of 1844 affords a good opportunity for inquiring, with the help of the experience which has now been acquired, whether a change of system is desirable.

The transfer of the railways to the State has been recommended by several witnesses, partly for the sake of its direct financial advantages, partly as affording the means of introducing an improved system of management.

The expectation of direct financial advantages is based upon the assumption that, as the Government can borrow money on more favourable terms than any other parties, this difference in the rate of interest would either be available as profit to the State or would afford an opportunity for the reduction of rates.

It is possible that a profit from this source might be obtained, if Government could buy the railways at 25 years' purchase of their average net profits; but at present unless the profits amounted to 10 per cent. on the capital expended, an additional amount would have to be paid, to be fixed by arbitration, and it is probable that any arbitrator between the Government and private companies on such a question would make a very large allowance for future increase of profits.

There being also above 2,300 miles (including some of the most important lines in the country) not subject to the Act of 1844, the purchase of these lines, which would be absolutely necessary to carry out the scheme, could only take place with the consent of the proprietors, and this could only be obtained by the offer of liberal terms.

It is probable, therefore, that in practice much of the assumed profit would disappear in the extra price, above the assumed 25 years' purchase, which would have to be paid.

In addition to the diminution of assumed profit arising from this cause, it must not be forgotten that as the Government would have to enter the market to borrow 400,000,000*l.* or 500,000,000*l.* to carry out the operation, the terms upon which this could be raised would in all probability be materially affected.

The depressing effect upon public securities would be equally felt, whether the Government conducted the whole operation at once, or whether it came into the market year after year to repeat an operation of about 25,000,000*l.* a year; and it is not easy to foresee what the price of consols would be under the proposed addition of 500,000,000*l.* to the national debt.

It is therefore probable that the Government would have to exchange the income of the railway companies for an equivalent income in consols, to avoid being called upon to make cash payments for the purchase money, which would have to be paid out of money borrowed in consols.

It cannot, therefore, be expected that under the provisions of the present law much profit could result to the State from the transaction as a financial operation.

Improved management. Leasing.

71. We have next to consider whether, if the State owned the railways, it would be able to improve the system of management. None of the witnesses have recommended direct management by Government officers, but in the opinion of some, great advantages would be derived from the adoption of a plan of leasing the railways in groups.

In the absence of any sufficient data furnished from experience it is difficult to express an unqualified opinion on this proposal, but we are unable to perceive that the expectation referred to rests upon any solid foundation.

The capital required by lessees for working a group of lines would no doubt be comparatively small, but yet it is manifest that Government could not safely enter into engagements with any lessees who were not prepared to give ample security for the payment of the stipulated rent.

Practically, therefore, the lessees would be either joint stock companies or wealthy capitalists; if the former, there is no ground for assuming that the directors of these companies would possess qualifications not to be found in those who now manage the affairs of railway companies; if the latter, they would not in most cases individually possess the knowledge or experience required for the direct management of the concern; in either case therefore it is probable that the actual conduct of the business would fall into the hands of the present staff, as the servants of joint stock companies or private capitalists, but if other persons undertook the duty, there is no guarantee that they would possess more capacity than the present officers, while it is clear that they would possess less experience.

Again, the transaction must necessarily be attended with risk to the lessees. They would be in this position; if the net earnings should exceed the rent even by a small amount, such small excess might afford a good dividend on the comparatively small capital invested by them; but on the other hand if the rent should exceed the net earnings by only a small amount they would be altogether deprived of any dividend. It is therefore naturally to be anticipated that any lessees, in calculating the rent they would be prepared to offer, would make large allowances for the speculative character of the undertaking, and consequently it is far from manifest that the State could rely on obtaining a rent adequate to reimburse it for the outlay in purchase. It further appears to us improbable that lessees would be found willing to fetter themselves by conditions imposing on them the reduction of fares and rates, or otherwise depriving them of the liberty of managing their affairs as they might think most conducive to their interests; and we are unable to perceive that their position would be more favourable than that of the existing boards for trying the effect of experiments, which though they might ultimately be advantageous would, on the assumption we have made, necessarily be attended with immediate loss.

It has not been distinctly pointed out to us in what respects it is to be expected that the system of management by lessees would be superior to that of the existing boards, but it is obvious that there are but two possible sources of improvement, viz., (1), the reduction of working expenses, and (2), the obtaining a greater amount of work from the engines and carriages, and so increasing the receipts in proportion to the expenses.

We shall have occasion in a further part of this report to refer at length to these questions; at present it may be sufficient to remark that they are questions the bearing of which is thoroughly understood, and the importance appreciated by the general managers and other railway officers, persons for the most part well qualified by their sagacity and ability for their position.

The general result of our inquiries is, that in the great heads of expenditure an increase rather than a decrease is to be anticipated, and that the economy arising from carrying full train loads, could be obtained only at the sacrifice of convenience and accommodation.

Further objections to Government purchase.

72. The financial view of leasing railways to companies for limited periods involves this further consideration. Either the improvements required to the lines and stations to provide for additional accommodation must be directly paid for by the State, or the State would have to allow for them at the end of a lease. In either case the question of the necessity and the mode of the execution and cost of the works would require a detailed consideration on the part of the State.

The Crown as the owner of the railway property of the country would be obliged to employ properly qualified engineers and others to investigate the details above mentioned, and to watch over the national property, in order to take care that it was kept in proper working order by its lessees, and that all the conditions of the leases were duly complied with. Considering the great responsibility and delicacy of the duties they would have to perform, this staff of officers would have to be highly paid; and having regard to the manner in which establishments have grown up in this country, bringing in their train compensations and superannuations, the expense on this account would probably ultimately become a not inconsiderable per-centage on the receipts from the lessees.

The practical result of any scheme for the national purchase and leasing of railways would merely be to substitute the lesser sense of responsibility of a lessee for a limited period administering the property of others, for the heavier and more durable responsibilities of owners managing their own property. But if the Government as lessors interfered to any great extent with their lessees, there would then be a divided and a still less efficient administration, of which any profit would go to the lessees, whilst any loss resulting from it would in the end be made to fall on the public revenue.

There is yet another difficulty contingent on the proposal which should be adverted to in considering the question of the purchase of railways by the Crown, and their lease to companies or individuals. The original terms of the lease, and the more or less stringent enforcement of its conditions, might be tempered by political considerations, seeing how large an influence the railway companies necessarily must exercise in the localities which they severally accommodate. Therefore the exercise of a discretionary power over them would be open to serious objections, and would inevitably lead to abuses.

These consequences could only be guarded against by defining the power and duty of the Crown in respect of the railway property by the most precise enactments, which would in effect regulate the use of the railways by positive laws of general application. But it is impossible to over estimate the difficulty of framing such general laws as would be applicable to the many particular cases which arise from the great variety and diversity of productive and commercial undertakings in this country.

And, as there is no intention of cheapening the means of conveyance by railway at the expense of the national exchequer, all general laws should be such as would not entail any loss in the administration of the railways.

Parliament has reserved to itself the right to pass any general law to regulate the railways owned by the several companies, therefore it would be just as easy to legislate on this basis for the existing system; and hence any alteration in the law, if desirable, could be obtained by the machinery of the present companies, without transferring the administration of the railways to new companies.

Hitherto our remarks have been confined to the railways merely, but the railway enterprize of the country has not been so restricted. It has on the contrary extended to a great number of collateral undertakings, not only to extensive factories for the construction or repair of its works and rolling stock, to large stations, machinery, warehouses, and other matters for the receipt and delivery of goods, and to arrangements for the supply of coal, but also to the subsidiary undertakings of canals, docks, harbours, and steam vessels, to facilitate and economize the transport of passengers, animals, and merchandize. These have been by special Acts declared part of the undertakings of the several companies, and have been carried on out of their capital. The earnings and expenditure on account of them have also been blended with the revenue and working expenses of the companies.

We think the Crown, if it purchased the railways, would be compelled to become the purchaser of all these subsidiary undertakings; but it would then become necessary as soon as this new policy had been adopted to consider the position of the rest of the canals and docks which are not so connected with railways, and which under such an arrangement would be to some extent obliged to carry on a competition with the State and its resources.

In the event of the Crown becoming the owner of the existing railways, it would either be necessary to adopt some entirely new system in regard to the further construction of railways, or their construction would devolve entirely upon the State.

Either proposals for new lines would be discouraged by the Government as tending to diminish the revenue; or, if this consideration were disregarded, schemes might be devised for new lines, so as to leave those existing a charge upon the State. At present these difficulties are of no public concern, being the ordinary contingencies incident to private enterprise. In any case, however, an end would be put to the present spirit of enterprise on the part of existing railway companies or others; but the liberty which is at present enjoyed of promoting new lines of railway is not only the best safeguard against abuse, but the surest means of securing for the public the greatest benefit from the present system.

French opinion.

73. We would, in conclusion, call attention to an extract from the report of the French Commission, which reported in 1863 upon the construction, working, and management of French railways; the Commissioners, whilst vindicating their own system of regulated protection, observe as follows:—

"One understands the complete liberty of action left to the English companies by their Special Acts in that country of free competition, where the antagonism between private interests, constantly in presence of each other, has long been recognized as an essential condition for duly protecting the public interests. By virtue of this system, which has been applied without reserve to railway concessions, very active competition exists between the English railway companies, so much so that as soon as the apathy or want of intelligence of one company allows the service of its line to deteriorate, a new enterprise springs up, and by offering greater facilities to the public appeals to the trade of the country, and forces the first company to bring its working up to the level of public requirements. In France, the absence, almost complete up to the present time, of all competition amongst railways discards that valuable equilibrium which is the safeguard of British industry."

General conclusions.

74. On the various grounds we have mentioned we cannot concur in the expediency of the purchase of the railways by the State, and **we are of opinion that it is inexpedient at present to subvert the policy which has hitherto been adopted, of leaving the construction and management of railways to the free enterprize of the people, under such conditions as Parliament may think fit to impose for the general welfare of the public.**

Future legislation on the subject.

75. Whilst expressing our opinion that it is inexpedient to put in force the Act of 1844, we by no means wish to be understood as attempting to lay down any rule to guide the action of the State for an indefinite future. Indeed, the Act of 1844 warns us of the extreme difficulty of making prospective arrangements to take effect after many years. Instead of facilitating the acquisition of the railways by the State, it has rendered the operation more difficult, and indeed almost impracticable with a due regard to the guarantees it has accorded to the railway companies. It would no doubt have been easier to treat with the companies without any special law than with the conditions which the Act imposes.

Without forecasting measures to meet the future necessities of the country, we may observe that before the Act of 1844 could be put in force it would have to be modified so as to be made applicable to new companies and to all existing companies, so that in the event of the Government exercising its power of purchase it should take the entire undertaking of the company without regard to the period at which any part of the line may have been sanctioned by Parliament; and that, whenever Parliament should determine to purchase the railways, the purchase should be disembarrassed from the difficulties which would arise from its being left open to arbitration.

In the event of the Government at any future time purchasing the railways, it has been judiciously provided in the Act of 1844 that the price shall be estimated upon the net divisible income of the line, without regard to the capital expended upon its construction. But in the clauses relating to the reduction of tolls, as also the claim for anticipated profits, in case the tolls have not reached the 10 per cent. maximum of profit, this computation of the maximum is made to depend both upon the net income and the amount of the capital of the company owning the line. At the same time Parliament has taken no effectual means to ensure that the whole of the capital of the company should be so expended on the permanent works as to be a fair measure either of the cost of the undertaking or of its value at any subsequent period. There has been no check upon the capital being issued at a discount, nor upon charges which properly belong to revenue, such as the maintenance of the line or rolling stock, or other current expenses, being thrown upon the capital to sustain a dividend. The recent disclosures of the proceedings of the London, Chatham, and Dover Railway Company illustrate in a remarkable degree how much the

nominal capital of a company may be increased by the mode in which it is raised. Out of the whole capital of 16,683,302*l.* not less than 4,109,796*l.* is admitted to have been dissipated in obtaining the rest from the public, and 1,948,007*l.* more was disbursed out of capital for payment of interest and dividends. (*See* Appendix DW.) It has obviously been impracticable for Parliament to refuse the applications of companies requiring further capital to complete their undertakings, on the ground that they have expended that already sanctioned in an improvident manner, as such a refusal would merely aggravate the evil; it would punish the innocent shareholders by completing the ruin of their undertaking, and prevent the public from having the use of the line. It should however be considered whether the maximum dividend of 10 per cent. on the capital should be maintained, unless it can be shown that the whole of the capital has been expended upon the permanent undertaking without being enhanced by other charges. These provisions have been departed from in the case of the Great Western Railway and some other railway companies whose maximum dividend has been reduced below 10 per cent.; and a different principle of reduction is also contained in the Liverpool and Manchester Railway Act before noticed in paragraph 6.

In any amendment of the Act of 1844 it would be worthy of consideration whether the principles of these Acts should not be further applied to meet the circumstances above mentioned. But in any case we think it is undesirable that the railway companies should be left in a state of uncertainty and subject to the perennial agitation of speculative opinions, or that the Government or Parliament should be constantly assailed with proposals of shareholders or debenture holders of unprofitable railways to subvert the existing system and appropriate the public resources to repay the money they have incautiously embarked in them.

Irish railways.

Proposals for Government purchase.

76. It has however been suggested that Ireland might be treated in an exceptional manner. It has been urged by the witnesses from that country, and also by other gentlemen of experience connected with railways, that there would be no financial difficulty in purchasing the Irish railways, and that the purchase might be effected on terms which would allow of such a saving in the interest on debentures and dividends on preference capital as would afford a margin fairly applicable to a reduction of rates. They also urge as an additional recommendation of the measure that it offers the only practicable means of escaping from the evils arising from the excessive number of small independent companies.

The capital sanctioned for the Irish railways is about 36,000,000*l.*, but of this only 26,390,000*l.* was actually raised by shares and debentures at the date of the last return in 1865. Hence their purchase by the State would not be exposed to financial obstacles as in England, but in all other respects the proposal is open to all the objections to which we have adverted in the foregoing observations. In one particular it may be deemed more objectionable than in the case of the English railways, inasmuch as it is of more importance not to discourage private enterprize and self-reliance in that country.

We shall not here make any further reference to the question of amalgamation, but shall return to the subject in a subsequent part of the Report.

Besides the proposal for the direct transference of the Irish railways to the State, various suggestions have been laid before us involving the principle of affording the aid of the State, with a view to the reduction of rates. By some witnesses it has been recommended that advances should be made to the companies sufficient to enable them to pay off their debenture debt and their preference capital on condition of an equivalent reduction of rates; by others it has been proposed that a certain proportion of any loss which might result from such reduction should be borne by the State. All these proposals appear to us to be contrary to sound principle.

It would be unjust to subsidise railways in order to induce a reduction of rates without doing the same for canals, inland navigations, and other means of locomotion of a proprietary character. The subsidy would have to be extended to future railways for those parts of Ireland not yet provided with railway facilities.

When capitalists undertake to construct a railway for the conveyance of persons and things at a lower rate than they can otherwise be conveyed, they unquestionably confer a great advantage on the public, but this furnishes no reason for the Government undertaking to reduce still further the cost of conveyance by giving the aid of its credit, or by making good the loss out of the public treasury.

The proposal to give a subsidy is therefore to pay out of the public treasury for a further reduction of the cost of conveyance, when a great reduction has already been made by means of a special contrivance; but to pay nothing when no reduction has been made because the ordinary road is obliged to be used.

No facts have been disclosed to us in evidence which would justify us in disregarding these considerations, or in recommending for adoption any of the proposals above adverted to.

Inadequate dividends.

77. Ireland has certainly no reason to be dissatisfied with the extent of railways constructed in it under the present system. In proportion to the resources of the country it is fully equal to that of the lines in the rest of the United Kingdom. It is complained that their profits have been for the most part insufficient, but the inadequacy of the returns appears to be due to causes which are not peculiar to Ireland, but exist in England where the circumstances are similar.

The main sources of the prosperity of English railways, viz., the large transport of passengers, arising from commercial activity and a wealthy population, and the carriage of goods arising from great manufacturing towns and mineral production in the centre of England, do not exist in Ireland; but where these elements are wanting, as in the agricultural counties of Norfolk, Suffolk, and Essex, and in the centre of Wales, the railways are as unprofitable as any in Ireland.

Alleged high rates.

78. On the part of the public it is complained that the charges are so high that the resources of the country are in consequence not developed. An opinion has also been very generally expressed, with more or less confidence, that the increase of traffic which would follow a large reduction of charges would be so great as ultimately to entail no loss. There is no doubt that in certain circumstances a well considered reduction is advantageous, and we understand that in some cases where the policy of lower fares than usual has been adopted by railway companies the results have been satisfactory, but we have no facts before us to justify an opinion that a general reduction on a large scale would not be attended with loss.

The geographical position of Ireland, and the condition of its industry, are by no means favourable for a great increase of railway traffic. The country enjoys in a remarkable degree the benefit of natural harbours, creeks, and rivers, so that no part of the country is more than 50 miles distant from a convenient port, whilst the greater part is much nearer. The mineral productions are raised, and the manufacturing industry is carried on, near the sea coast, where the principal towns are situate, and enjoy the advantage of importing their raw material from abroad by sea.

The industry of Ireland is mainly employed upon agriculture, and the amount of traffic from such industry is necessarily limited in quantity as compared with that of manufacturing districts.

The imports into the interior are in like manner restricted to the comparatively small bulk or weight of articles other than food produced and consumed by a rural population, whilst the absence of commercial activity, or of a wealthy resident population, in the central parts of Ireland, reduces to the lowest degree both the necessity and the disposition to travel.

It has been complained that the cattle trade is prejudiced, and there is no doubt that a large quantity of lean stock are driven from one part of the country to another along the roads, and are not conveyed by railway. As there are many districts at a considerable distance from the nearest railway, much of this description of stock would still continue to travel by the roads, however large a reduction might be made in railway rates. It is stated also by the witnesses who have given evidence on this question, that nothing short of a very great reduction in rates would induce graziers to send their lean stock by railway; and as this description of traffic, even at present rates, does not appear to be very remunerative, it is evidently probable that a reduction of 50 per cent., as is asked for, might be attended with serious loss.

The coal traffic of Ireland is very limited in quantity. The bogs have hitherto supplied much of the interior with fuel, but peat seems to be gradually becoming dearer with the rise in the wages of labour, and coal will therefore naturally have a tendency to supersede it. It is probable that if its price could be materially reduced, an important stimulus would be given to its consumption. The charge, however, for transporting coal at Dublin from ships to the railway stations is stated to be 3*s*. 6*d*. per ton, a sum equal to 50 per cent. of the railway rate to the centre of Ireland, and unless the cost of this transport can be reduced, no lowering of railway rates would have a fair trial or could have much effect. It is not immaterial to remark in reference to this question that coal is not dearer in the interior of Ireland than in the south of England.

It has been stated that the development of mining industry is not encouraged by the railway companies; but it does not appear that any offers of valuable mineral traffic have

been made to them and declined. It must be borne in mind that mineral traffic at low rates is profitable only when conveyed in full train loads and for considerable distances.

As the average distance for which goods could be conveyed in Ireland cannot be estimated at more than 30 miles, the effect of a reduction of rates in stimulating industry and enterprise would not be such as to alter the conditions under which they now exist in Ireland. After making a reasonable allowance for terminal charges a reduction to one-half the present rate, which may be taken at the average of 1½*d.* per ton per mile, would only be 1*s.* 10½*d.* a ton for 30 miles, or less than 6*d.* on a quarter of grain, and about 1*d.* on a cwt. of flax.

Results of railway enterprise in Ireland.

79. A comparison of the results of railway enterprise in Ireland with that in Scotland forcibly illustrates these considerations. The population of Ireland at the last census was 5,798,967, that of Scotland 3,062,294. At the end of 1865 there were 2,200 miles of railway open in Scotland, the cost of which had averaged 22,821*l.* per mile. In Ireland there were 1,838 miles of railway open, the cost of which had averaged 13,965*l.* per mile. The gross receipt from traffic for the year in Scotland amounted to 1,812*l.* per mile of railway, and in Ireland to 945*l.* per mile of railway; and whilst the net receipt in Scotland yielded 4·4 per cent. on the whole money invested, in Ireland the net receipt yielded only 3·5 per cent. The rates authorized to be levied by the railway companies are as high in Scotland as in Ireland; it is owing to the different circumstances of the country and the condition of its industry that railways are more profitable in Scotland than in Ireland.

General conclusions and recommendations.

80. On these several grounds, having come to the determination that it is inexpedient that the railways should be purchased by the State, **we consider that there is not sufficient reason for excepting Ireland from this general conclusion; but as it has been the established policy to assist Railways and other public works in Ireland, we recommend that when Parliament thinks fit to make advances to Irish Railway Companies, the money should be lent for a fixed period of considerable length, so as to enable the Company to develop its resources before it is called on for repayment. We are, however, of opinion that advances should not be made to the Irish Railway Companies as a condition of reducing their rates and fares, but that as the Railway Companies have the best opportunities of judging whether rates can be reduced so as to be recuperative within a reasonable time, they should be left to carry out such experiments at their own risk.**

PART IV.

Present system of private Bill legislation.

81. Having, therefore, decided not to recommend the purchase of the railways by the Government, it becomes necessary to consider a further preliminary question, viz., the manner in which railway companies obtain their powers. For it has been contended that many evils alleged to exist in the railway system are mainly due to the manner in which the original concessions to companies are granted, or the arrangements affecting subsequent proceedings of the companies are regulated, by the intervention of Committees of the Houses of Parliament; and that unless this be entirely changed, and an executive Government Board be charged both with sanctioning new projects and regulating the powers of railway companies these evils cannot be remedied.

The railway companies also allege that the Private Bill legislation is uncertain, that their interests are constantly subjected to litigation in Parliament, and that the conflicting views of Parliamentary Committees interfere with the management of their property.

It will be desirable therefore, before entering into the complaints alleged against the results of the existing system of railway legislation, to consider whether any modifications of the system itself are desirable or practicable, in order to secure a more efficient control either over the construction of railways or their administration.

Nature of the tribunal.

82. In considering the system of Parliamentary procedure in respect of Private Bill legislation, it is necessary to bear in mind the nature of the tribunal to which the Bills of railway companies are submitted.

The individual members of committees who sit on Railway Bills are continually varying, and the views of public interests therefore taken by committees will also vary. They have presented to them the case of the promoters. Originally, with the object of protecting the interests of the locality, the members of Parliament representing the districts concerned were placed upon the committees; but this arrangement was discontinued in 1844, and now the only means by which the general interests of the public or of the locality are brought to the notice of the committees are by the reports of the Board of Trade, the supervision over Private Bill legislation by the Chairman of the Committee of Ways and Means in the House of Commons, and the Chairman of Committees in the House of Lords, or by the appearance of parties in opposition to the Bill. The expense of opposing Bills in Parliament and the conflicting interests of those they represent may prevent local authorities from resorting to this course, except for the protection of local interests.

Questions of general public interest are thus only guarded by the other means above stated, or are brought forward as it suits private parties interested in the Bill to use them in support of their own case.

Unopposed or altered bills.

83. When, however, Bills are unopposed the only protection to the public arises from the vigilance of the Chairman of Ways and Means in the House of Commons, or the Chairman of Committees in the House of Lords.

It often happens in the case of unopposed Bills that fresh clauses are introduced in committee in that House of Parliament in which they are first considered, and thus there is a liability that conditions may be granted which, if contained in the original Bill, might have been objected to by the Board of Trade as being at variance with the general course of legislation. Opposed bills also in passing through select committees are often subject to alterations which may materially affect public interests; and if the opponents are unaffected by such alterations they may pass without sufficient consideration.

With the object, therefore, of affording the Board of Trade an opportunity of raising objections if it thinks fit, as well as with the further object of securing a more careful consideration of unopposed Bills than is at present the practice, we would suggest that **all Bills, after having passed through the Committee of the House in which they have been first introduced, should be referred back specially to the Board of Trade for further report, and the Board of Trade should in such report specially consider every point in which public interests are involved.**

Want of uniformity in Parliamentary decisions.

84. In the earlier stages of Private Bill legislation there was considerable diversity of practice, but since the year 1846, the Houses of Parliament have laboured to obtain uniformity on material points.

The nature of the tribunal however is such that many important differences in principle have been affirmed by Parliament in the special Acts of railway companies.

For instance, whilst Parliamentary Committees have generally maintained the principle of competition between adjacent railway companies, by allowing one railway company to push lines into its neighbour's districts, the Act which amalgamates the West Midland with the Great Western Railway provides, by an agreement scheduled to the Act, that the Great Western, Midland, and London and North-western Railway Companies are to have a right of through booking between certain stations on each others lines, but that no one of the companies is to construct, or lease, or work any railway in the districts common to the companies or any two of them without the consent of the company or companies affected.

Similarly, whilst the Select Committee of the House of Commons of 1853 urged as a general principle that amalgamation between large companies should not be permitted, we have shown that the Committees on the Private Bills of that session and subsequent sessions sanctioned extensive amalgamations.

In dealing with financial matters Parliamentary Committees have occasionally sanctioned a departure from obligations which Parliament had in the first instance imposed.

In some cases Parliament has relieved railway companies from the full discharge of their liabilities; in other cases, where companies who have made improvident bargains came before Parliament for assistance, it has set aside those bargains.

Thus, in the case of the Caledonian Railway, it compelled preferential shareholders of lines which had been absorbed by it to accept a lower rate of preferential dividend than they had originally contracted for on advancing their money and transferring their lines to what afterwards had become a bankrupt company. In the case of the London, Chatham, and Dover Railway, Parliament allowed fresh preferential capital to be created over existing preference shares.

Particular views of Parliamentary Committees.

85. It is a necessary consequence of the constitution of these committees and of the manner in which the business is conducted, that they should look to the merits of the special case entirely through the medium of the facts brought to their notice. It is not to be expected that they would act on grounds of general expediency which might appear to inflict hardship on the parties actually before them.

Moreover, no Committee, in which are vested what are practically absolute powers, would consent to defer its opinion to any general dictum given by another tribunal. In considering the case before it, the Parliamentary Committee looks upon itself as, and practically becomes, an independent court of appeal from any such general rules previously laid down, and from the decisions of any previous committees, which may have sat in former sessions on the same case.

Effects of these on the railway system.

86. This system of considering each application for a railway upon its own merits, without reference to any preconceived scheme for the general accommodation of the country, may have led to a larger expenditure of capital than was necessary.

In some cases each company which had access to some particular town has been allowed to make a station, where a joint station would have been far more convenient and less costly. In other cases two lines have been allowed to run side by side, where one line to accommodate both companies would have sufficed.

But on the other hand, the freedom from defined principles of action in granting new lines has led to a much more rapid development of the railway system, and consequently of the trade of the country, than could otherwise have taken place, and to a greater regard being paid to the special wants of particular branches of industry and commercial communication.

Necessity of appeal to Parliament.

87. There are still districts not yet adequately supplied with railway communication, and the public are continually seeking to obtain some improvement in or addition to the accommodation which it possesses, either by promoting new lines in opposition to existing lines, or by concessions from existing companies. The commercial and other interests at stake are in many cases so great, and the railway interests so powerful, that neither party would consent to have questions of important conflicting schemes settled by any tribunal without a power of final appeal to Parliament.

Without entering further into the reasons which have been given for and against the existing system, we think it right to assume that the power which Parliament now exercises over railway Bills will be maintained.

Absolute uniformity not necessary.

88. Nor do we consider absolute uniformity in the provisions of the Acts either necessary or desirable. The cost of a railway varies from 4,000*l.* per mile to possibly 1,000,000*l.* per mile, according to the district in which it is placed. For instance, a densely populated district, occupied by a manufacturing or a mining population, has far different wants from an agricultural population; and the mountain districts of Scotland, or the sparsely inhabited portions of Ireland could be supplied with railway communication suited to their wants, by means of a very different mode of construction from that necessary for South Staffordshire or the Metropolis.

In some cases, parties interested in a locality or a port may agree in thinking that their local interests will be benefited or developed by lines tributary to the port, and specially adapted to the wants of the district. In such cases, when proprietors are disposed to give land, and when trustees of roads and all local interests concur, we see no reason why Parliament should withhold its sanction because the proposed line may not conform to some *à priori* conclusion as to what the tolls and the rates, and the character of a railway should be.

French opinions on the subject.

89. The French Commission which inquired into the French Railways in 1863 carefully compared their own system of *à priori* rules, with the systems in other countries, and came to the conclusion that the progress of railways in France had been prejudiced and retarded by an adherence to a preconceived system, and they considered that it should be relaxed. The following are the recommendations they proposed:—

"In consequence, M. le Ministre, the Commission are of opinion that the greatest possible latitude should be allowed to the Government in authorizing railways of mere local interest, and that also equal latitude be granted to the company in constructing and in working them.

"That the lines of this especial railway system, being for the most part exceptional or branch lines, may, and in fact ought, to differ essentially, both in their construction and in their mode of working, from those railways comprised under the systems already established.

"That henceforth the conditions of the concessions (influencing everything with reference to the lines) ought to be simplified in such a manner as to allow,—first, that the width of the gauge, the weight

of the rails, the rolling stock, the curves and inclines, should be capable of variation according to circumstances; secondly, to suppress the necessity of close fencings, and also to authorize the simplest form of station buildings.

"That it would also be desirable that the railways forming each group should be constructed with the same width of gauge, so that the same rolling stock would be applicable to all; but at the same time, that this exact uniformity should not be enforced as an absolute law.

"That with regard to the working of the lines, the Government legislation should be limited to those police regulations which are indispensable to the public safety.

"That the privileges of the Act of 21st May 1836 with regard to "highways and thoroughfares" should be extended to all railways of local interest, and more especially those clauses of the Act which define the preliminary investigations and the purchase of land."

General conclusions and recommendations.

90. It is, however, a question of some importance whether the functions of the Parliamentary Committees might not be more conveniently limited to those questions which directly affect the relations between the railway companies and the public, for which Parliamentary interference is necessary; and whether many of the details, especially financial, which now occupy the attention of committees might not be more properly left to be dealt with by general laws.

We have already shown that the powers conferred by the special Acts which authorize these undertakings may be divided into three parts.

In the first place they create an incorporated company, with power to raise capital and with all the corporate privileges attaching to such incorporation. In the next place they give the incorporated company the necessary powers to take land, and otherwise interfere with existing interests, to enable them to construct their lines; and thirdly, they regulate and define the right of the public to use the railway, and of the company to levy the tolls and charges.

The necessity for the first of these provisions arose from the circumstance that, in the earlier days of railways, joint stock enterprise was in its infancy.

Incorporation, with the extinction of individual liability, was regarded as a privilege, and was only granted by Parliament to enterprises or trades which it was considered could not be effectually carried on by individual capitalists or private partnership.

It follows, as a consequence of Parliament having granted to each company in its special Act its charter of incorporation, that when the company desires to alter the terms of that incorporation as between the several shareholders, or to enlarge its original capital, or to vary the conditions under which the capital is to be raised, a fresh application to Parliament becomes necessary.

Hence a very large number of the Bills submitted to Parliament are for the purpose of enabling the companies so incorporated to vary the conditions of what, in an ordinary joint stock company, would be comprised in its articles of association.

In thus dealing with the financial affairs of the companies, Parliament has been led on to legislate in great detail, and has occasionally been in the position of having to free railway companies from obligations which they had incautiously incurred, and to consider questions which might otherwise have been disposed of by the shareholders, or by the ordinary judicial tribunals.

This detailed interference with the capital of the companies does not appear, however, to have secured to Parliament a practical control over the finances of railway companies in cases where they have not been able, or have not desired, to keep within the limits originally assigned by Parliament: nor to have protected the public from any abuses which might have crept in even if the companies had been left under the operation of the Joint Stock Companies Act.

In fact, these Parliamentary restrictions tend to give the investing public the idea that they possess some peculiar advantage, and to lull them into a false security as to the value of the debentures and of the share capital. But now that Parliament has adopted the policy of placing any lawful enterprize, conducted by means of a joint stock capital, within the reach of all associations of persons more than six in number, and has conferred upon them the privilege of limited liability, it would appear to be a more judicious course **that Parliament should relieve itself from all interference with the incorporation and the financial affairs of railway companies, leaving such matters to be dealt with under the Joint Stock Companies Act, and should limit its own action to regulating the construction of the line and the relations between the public and joint stock companies so incorporated; requiring such guarantees as may be necessary for the purpose of securing the due performance of the conditions upon the faith of which the Parliamentary powers of the company have been granted.**

Some such modification as this seems to be the only one which could work satisfactorily under the present system of Private Bill legislation.

Amendments in Joint Stock Companies Act.

91. In suggesting that railway companies in future may be constituted under the Joint Stock Companies Act we by no means assume that the provisions of that Act require no modifications or amendments, for we think it would be desirable that, without undertaking to protect the public against their own indiscretion, greater facilities should be afforded for the detection and repression of some acts by which the public are misled or deceived in the formation and management of joint stock companies.

The concealment or imperfect representation of important facts, which no one is charged with the duty of faithfully disclosing to the shareholders or the public, will be found to underlie most of the delinquencies in this respect, and there can be little doubt that many objectionable transactions would not be embarked in if they were to be immediately followed by publicity and be subjected to the scrutiny of public opinion. When, for example, a company is established by the allotment of shares for cash payments, the shareholders and the public readily infer that no other kind of allotment is to be made unless it be publicly announced; and when no preliminary contracts or arrangements affecting their future rights are mentioned, they naturally assume that none exist, for they have no means of informing themselves of the truth.

System of audit.

92. It has, however, been thought by some that no legislation to repress the abuses which have occurred in the promotion and management of joint stock companies will be of any avail without a system of Government audit of their accounts; but before arriving at any conclusion on this point it is necessary to consider the present system of audit under the Companies Clauses Consolidation Act, by which railway companies are regulated.

It will be convenient in the first place to recapitulate the main objects which it has been the intention of Parliament to secure by law.

(1.) A clear and faithful record and account of all the financial transactions of the company.

(2.) A power for each shareholder to inspect within certain fixed and limited periods the company's accounts, and to take copies or extracts.

(3.) The preparation of a balance sheet.

(4.) The appointment of auditors from among the shareholders.

(5.) The preparation of a scheme for the declaration of a dividend to be paid out of the profits of the company.

The following is, however, the manner in which it has been endeavoured by the Act to secure these objects.

The company at its annual meetings is to appoint two auditors, one of whom is to retire annually, but to be re-eligible.

The directors are to deliver to the auditors half-yearly or other periodical accounts and balance sheets 14 days before the meeting at which they are to be produced to the shareholders.

It is the duty of the auditors to receive and examine the same; they are empowered to employ such accountants and other persons as they may think proper, at the expense of the company, to assist them, and they may either make a special report on the accounts, or simply confirm the same.

The accounts of the company are to be kept by the directors, and the books are to be balanced at the prescribed periods, and thereupon the exact balance sheet is to be made up, which shall exhibit a true statement of the capital stock, credits, and property of every description belonging to the company, the debts due to the company, and the debts due by the company, and a distinct view of the profit or loss which has arisen in the course of the half year. It is also provided that before apportioning profits the directors may set aside out of such profits a sum to meet contingencies, dividing only the balance among the shareholders. This formation of a reserve or depreciation fund is, however, not made imperative, neither is the amount fixed by law.

The application of the language of these provisions to the transactions and accounts of railway companies is by no means free from difficulty, but in practice we believe a very short summary of account is usually laid before the auditors, who make an examination of it within a very limited time. The daily transactions of railway companies are so numerous that the company is compelled to employ a staff of clerks and accountants proportionate to the magnitude of its business to examine and check every transaction as it occurs, under the superintendence of its chief officers; but the manner in which every transaction is debited or credited depends upon the orders issued at the time the transaction takes place. These accounts could, therefore, only be checked efficiently by a contem-

poraneous audit by an establishment employed in the same office, or by a complete transfer or transcript of the accounts, vouchers, correspondence, minute books, books, and registers to be examined elsewhere.

It is quite competent for the shareholders of any company to direct their auditors to investigate the accounts of the company to any extent they think necessary after they are rendered half yearly; but it does not seem to be in their power under the Act to direct any continuous daily audit of accounts, if this duty should be neglected or improperly performed by the directors, who have the entire control of the accounts.

We do not think it would be desirable to impose upon the Crown the duty of auditing the accounts of joint stock companies, and certifying to the shareholders the correctness of their own balance sheets; for in practice this would either become a mere form, calculated to mislead, or would require a very large staff of officers, and in either case would involve very serious responsibilities merely to relieve the shareholders of a duty which they can equally well perform for themselves by the election of competent auditors with adequate powers and sufficient remuneration.

We need only refer to the report of the auditors of the London and North-western Railway Company, printed in Appendix EF., for the purpose of showing how much may be done by the companies themselves for the purpose of ensuring a supervision and audit of their accounts and presenting a true view of the state of their affairs to their shareholders. But it is manifest that the provisions of the Companies Clauses Consolidation Act are insufficient to give the shareholders full power for this purpose, in case the directors are otherwise disposed; and we see no reason why the shareholders in these companies should not have as much power over their affairs as the shareholders in other joint stock companies. The restriction upon selecting auditors from among the shareholders should be repealed, and the auditors should be empowered to carry on a continuous audit, and to call for all books and documents necessary to elucidate not only the balance sheet, but the whole financial position of the company.

We therefore recommend that **the Companies Clauses Consolidation Act should, as respects the audit of accounts, and the power of the shareholders to inspect them, be assimilated to the provisions of the Joint Stock Companies Act.**

Advantage of frequent applications to Parliament by railway companies.

93. It is, however, of no slight importance to the public that railway companies should be compelled to apply to Parliament for its sanction to every alteration of, or addition to, their undertakings, and that any other railway company or person affected by the change should have the liberty of being heard in opposition.

The railway companies being thus continually before Parliamentary Committees, either to defend their interests against invasion or to obtain further concessions from Parliament, an opportunity is afforded to the public of bringing forward any grievances from which they may suffer, and to Parliament of imposing such fresh regulations as the public interests may require, as a condition of the new concession.

Thus Parliament becomes an arbitrator between the railway companies and the public, and the railway companies voluntarily accept its decisions to promote their own objects or interests. This operates as a powerful inducement to the companies to remove any grievances of which the traders in their different districts might complain.

Railway Construction Facilities Bill.

94. It has been suggested that the Railway Construction Facilities Bill has not produced the effect which was intended in consequence of the prohibition contained in it against any branch being authorized in face of the opposition of the railway company affected by it; but as the consent of every other owner of property is required to the proposed undertaking we do not think that the railway company can be placed on a worse footing and deprived of the right of presenting its case for the consideration of Parliament; and if it were so deprived, the prohibition would probably fail in its object, as the railway company would find it easy to induce some landed proprietor to permit its case to be brought forward under colour of his own opposition.

On these several grounds we believe that Private Bill legislation can only be dispensed with to the extent we have pointed out, and we do not think it would be possible, even if it were desirable, for absolute uniformity of decision to be obtained in those matters which we recommend should still remain subject to its jurisdiction.

Desirability of consolidation of Railway Acts, and of interim registration.

95. There is, however, one question affecting Private Bill legislation which remains to be considered. It is contended that serious inconvenience to the public results from this special legislation because the powers of the railway companies and the consequent rights of the public are now scattered through above 3,100 Acts of Parliament, extending over half a

century, many of which contain exceptional and varying provisions, so that it becomes exceedingly difficult to ascertain what is the law applicable to any particular case. As regards, however, the special clauses relating to local or personal rights, it is to be observed that as those interested in them have caused their insertion, they may be assumed to be perfectly informed on the subject; but as regards general clauses applicable to the public at large, the inconvenience is more serious, and deserves attention. In order to remedy this evil we recommend that **when railway companies apply to Parliament for power to amend their Acts, advantage should be taken of the application to require them to consolidate all the clauses of existing Acts which remain permanently applicable to their undertaking.**

In consolidating Railway Acts some danger, however, exists that clauses affecting private individuals might be suppressed or dropped out. With a view, therefore, **to protect public and private interests, and to guard against errors, the examination of the Consolidation Bills should be committed to the Board of Trade,** and that Department should be charged with the duty of reporting upon their accuracy.

This work would be one which must necessarily occupy considerable time if adequate care is to be bestowed upon the examination. In the meantime, the provisions of the Railway Companies Securities Act, requiring the railway companies to register at the office of the Registrar of Joint Stock Companies the titles of the Acts of Parliament under which they have contracted mortgage debts, might be extended, and **railway companies should be compelled to keep at the office of the Registrar of Joint Stock Companies a complete collection of all the Acts in force applicable to their undertaking, to be open to public inspection.**

PART V.

Question of improvements in legislation as to the working of railways.

96. Having disposed of these preliminary questions, we will now examine how far it is necessary and practicable to extend the provisions of the general Acts regulating railways, for the purpose of securing to the public the more complete enjoyment of the rights which Parliament intended to confer upon them in respect of railways constructed under its sanction.

The following are the instructions laid down to guide our inquiry, viz.:—

"To inquire into the charges now and heretofore made by the several railway companies of Great Britain and Ireland for the conveyance on their lines of passengers, parcels, goods, minerals, animals, agricultural products, and other merchandize, and into the equality or difference of such charges under similar circumstances, whether as between different companies or by the same company in different cases; and where such inequality or difference exists, to inquire whether there are special circumstances which render necessary such inequality or difference, and also to inquire into the actual costs of such conveyance, and to compare such costs and charges respectively with the costs and charges relatively to the accommodation given and service performed on the railways in any one or more foreign countries; and to report whether, with a due regard to the progressive extension of the railway system, it would be practicable, by means of any changes in the laws relating to railways or otherwise, to effect a more convenient interchange of traffic between the several systems of railways, and more economical arrangements for the working of railways, so as to make any considerable reduction in the said costs of conveyance, and in the charges to the public on account thereof; and more effectually to provide for securing the safe, expeditious, punctual, and cheap transit of passengers and merchandize upon the said railways, with as near an approach as may be to uniformity of charge and equality of treatment for all persons under similar circumstances."

To explain clearly the conclusions at which we have arrived upon the several questions we have been instructed to inquire into, it will be convenient to consider them in the following order:—

1. Inequality of rates and fares.
2. Equality of treatment under similar circumstances.
3. Actual fares and rates as compared with former charges and with corresponding charges on foreign railways.
   - *a.* Passenger fares.
   - *b.* Goods and mineral rates.
4. Conditions affecting economy and safety of working.
5. Interchange of traffic.

1.—Inequality of Rates and Fares.

Inequality of charges.

97. The most material complaint which we have received from the witnesses we have examined upon this subject is that the rates for conveyance of passengers and goods are unequal on different railways and on different parts of the same railway, and that in consequence of these unequal rates some districts receive advantages which place them in a better position for competition than others.

Rights of the companies and of the public.

98. The rights of the railway companies and of the public respectively in this matter are thus defined in the Railway Clauses Consolidation Act:—

"And whereas it is expedient that the company should be enabled to vary the tolls upon the railway, so as to accommodate them to the circumstances of the traffic, but that such power of varying should not be used for the purpose of prejudicing or favouring particular parties, or for the purpose of collusively and unfairly creating a monopoly either in the hands of the company or of particular parties; it shall be lawful, therefore, for the company, subject to the provisions and limitations herein and in the special Act contained, from time to time to alter or vary the tolls by the special Act authorized to be taken, either upon the whole or upon any particular portions of the railway, as they shall think fit."

All the railway companies have freely availed themselves of the powers conferred upon them by this Clause.

Causes of unequal rates; their advantages.

99. The carrying trade brings the railway companies into competition with carriers on roads, canals, and rivers, as well as with the whole coasting trade. The companies, therefore, without regard to the rates which they charged elsewhere, have found it necessary to reduce their rates below those charged for the existing means of conveyance, whatever its cost might be, in order to draw traffic on to their own lines. However much the owners of the existing modes of conveyance may have been prejudiced, the general public have derived an unqualified advantage from the great increase of facilities for the conveyance of merchandise, which we have no doubt has largely contributed to the development of the industry and resources of the country.

Inequality of charge in respect of distance, besides being a necessary consequence of this competition, is an essential element in the carrying trade, that is to say, the principle which governs a railway company in fixing the rate is that of creating a traffic by charging such a sum for conveyance as will induce the produce of one district to compete with that of another in a common market.

Hence, even if the railway company be assumed to have a complete monopoly of the railway communication of the district it occupies, it must in its own interest regulate its accommodation so as to produce as large an amount of remunerative traffic as possible.

The power of granting special rates thus permits a development of trade which would not otherwise exist, and it is abundantly evident that a large portion of the trade of the country at the present time has been created by, and is continued on the faith of special rates.

Difficulties of legislation.

100. The conditions under which such rates are granted are so numerous that no special law could be framed to regulate them. It has indeed been suggested that it should be left to a Government board or other tribunal to arbitrate in cases where the traders asked for reduced rates, and the railway companies refused them; but it must be recollected that the companies are entitled to derive a benefit from the rates assured to them by Parliament, and the course suggested would be tantamount to transferring this benefit from the companies themselves to individual traders, in order to add to the profits of their business, established with a full knowledge of the system of railway rates.

Power in the hands of the companies.

101. There is no doubt that this system confers great powers on the railway managers and directors in regard to the markets for those articles in whose cost the carriage forms an important element.

It is however the interest of every railway company to develop the trade of its district, and we learn from the North Staffordshire Railway Company that on the temporary stoppage of the supply of coal in 1864, that company, to keep up their traffic (dependent on the prosperity of the pottery trade), carried coal from the Derbyshire and Leicestershire coal-fields at a rate of freight barely in excess of working expenses. Had the railway company not done so the pottery trade would have come to a stand-still, and the railway company would have sustained great loss. Similarly the Great Western and London and North-western Railway Companies brought coal into South Staffordshire from Wales at very cheap rates. More recently, in the case of a temporary interruption of the iron manufacture, the North Staffordshire Company carried puddled bars at exceptionally low rates of freight.

Unequal rates sanctioned by law courts.

102. It is worthy of notice that under the Traffic Act the Court of Common Pleas has distinctly recognized the right of a company to charge unequal rates. In the case of Ransome *v.* Eastern Counties Railway, it held that a company may charge different rates for carriage where the expenses thereof are different (if this be not done to enable one particular person, A., to compete with another, B.), and as the expense of starting a train is the same for a large or small distance, this may fairly be taken into account, and justify an inequality in the rates of carriage between different places.

Difficulty of enforcing uniform rates.

103. It has further been alleged against the system which permits of unequal rates, that in cases of traffic of the same nature carried on from two districts to a common market, the rates have been so favourable to one district as to shut out the other.

Without entering into the question whether a uniform rate over the whole country would not operate effectually to shut out all the traffic now carried to distant markets, it is evident that there can be no mean course between allowing the railway companies to charge what rates they think expedient within a maximum limit, and requiring that a rate proportioned to distance, or at least an equal rate for equal distances, shall be adopted.

Many important districts have access to each other by navigable rivers and by the sea as well as by railways, and hence if a uniform rate were made compulsory it would prevent those districts which possess a water route as well as a railway, from getting the benefit of the low rate they now obtain from the competition between the railway and the sea or river, and thus raise the price of the article to the consumer; or else, it would act as a prohibition to the railway companies whose lines are in competition with the coasting trade from carrying certain classes of traffic, and in either case would check trade. Moreover, the competition which now exists between the produce of different places in a common market would be seriously prejudiced by uniformity of rate.

It must not be forgotten that the canal companies enjoy the right under their special Acts of regulating the tolls within a maximum, and the Act of 1845 (8 & 9 Vict. c. 42.) was passed to empower canal companies to become carriers on their own canals, with the object of enabling them to compete more effectually with railways.

If any change of system were introduced on the railways it would be found necessary to modify the existing rights of canal companies, so as to bring them into harmony with the regulations which might be established for railways.

Interest of the railway companies to encourage the prosperity of their districts.

104. It is clear, from these considerations, that the interest of the railway companies is intimately wrapped up in the prosperity of the districts which they serve. It is possible that railway companies may not always take enlightened views in managing their traffic; but even in this case the public obtains the fulfilment of the conditions upon which it has deemed it proper to concede the right of constructing the railway for the conveyance of passengers and goods within the prescribed limit as to tolls and charges.

Alterations of rates.

105. Parliament has, however, not only left the railway companies free to fix the rates, but has put no restraint upon the manner in which they may from time to time vary these rates. It has been represented that it is a source of great inconvenience to traders, and in some cases attended with very serious loss, that rates are changed without any previous notice. We do not think the suggestion that railway companies should be bound to give a very long notice to meet the convenience of persons who have entered into prolonged contracts, is well founded, as it is the obvious duty of such persons to guard in the terms of their engagements against a contingency which is known to exist. But on the other hand it is impossible to provide in the ordinary current transactions of business, for a sudden change in the cost of conveyance, which may be a material item in the market value of a commodity. We think therefore that railway companies should be compelled to give reasonable notice of any intention to raise their rates.

General recommendation.

106. For the several reasons we have stated, **we do not consider that it would be expedient, even if it were practicable, to adopt any legislation which would abolish the freedom railway companies enjoy, of charging what sum they deem expedient within their maximum rates when properly defined, limited as that freedom is by the conditions of the Traffic Act; but we are of opinion that railway companies should be required to give a reasonable notice of their intention to raise their rates of charge.**

2.—Equality of Treatment under similar Circumstances.

107. An important complaint has been made that the system of special rates opens the door to injustice between traders in the same district, if not to favouritism of individuals. Equality of treatment.

The Railways Clauses Consolidation Act, after stating that a company is at liberty to vary its rates within its Parliamentary maximum, enacts—

"Provided that all such tolls be at all times charged equally to all persons, and after the same rate, whether per ton per mile or otherwise, in respect of all passengers and of all goods or carriages of the same description, and conveyed or propelled by a like carriage or engine passing only over the same portion of the line of railway under the same circumstances; and no reduction or advance in any such tolls shall be made either directly or indirectly in favour of or against any particular company or person travelling upon or using the railway."

The Traffic Act provides that no company shall make or give any undue or unreasonable preference or advantage in favour of any particular person or company or particular description of traffic. The decisions of the Courts under the Traffic Act afford some clue to the rights of the public in this matter.

When an application was made to the Court of Session in Scotland (Hozier *v.* Caledonian Railway Company)—

"Where it appeared that A. resided at M., an intermediate station between two large towns, G. and E., and that the fare from M. to G. was 2*s.* 6*d.*, and from M. and E. was 9*s.* 6*d.*, but the through fare from G. to E. was only 2*s.*, an application by A. to the Court of Session to equalize the fares was refused; it being held that, as far as the statement of the petitioner went, nothing unreasonable was shown."

In the case of the Caterham Railway Company *v.* the London, Brighton, and South Coast Railway Company and South-eastern Railway Company, the Court of Common Pleas held that higher charges on one branch line than on another do not *per se* constitute an undue advantage.

On the other hand, in the case of Baxendale *v.* the Great Western Railway Company, the Lord Chief Justice Cockburn—

"held that if the Court became clearly satisfied that a company was seeking to promote its own advantage by establishing an inequality which was unreasonable under the circumstances, and operated unfairly and injuriously upon particular individuals, or that it was affording to one person or set of persons an advantage which it would not afford to another under similar circumstances, this Court would not hesitate to interfere to prevent such a result; although by so doing they might prevent the company from securing all the profit that it might otherwise derive from the use of its property. Thus, were a complaint made that a railway company, as between two intermediate stations, charged a higher rate than was due to the intermediate space in proportion to the charge made on the entire line of railway, this Court would, if it were made to appear that the disproportion was not justified by the circumstances of the traffic—in other words, was an undue prejudice or unreasonable disadvantage to those using the part of the railway in question—would interfere to set aside such arrangement. So, again, if an arrangement were made by a railway company whereby persons bringing a larger amount of traffic to the railway should have their goods carried on more favourable terms than those bringing a less quantity, although the Court might uphold such an arrangement as an ordinary incident of commercial economy, provided the same advantages were extended to all persons under the like circumstances, yet it would assuredly insist on the latter condition, and would interfere in the case of any special agreement by which the company had secured to a particular individual the benefit of such an agreement to the exclusion of others, or even where an attempt had been made, by keeping the agreement secret, to make it operate unduly to the prejudice of third parties."

It is therefore clear that the law requires that all traders in the same class of goods, between the same localities under the same conditions, should be charged the same rate.

It is, however, due to the railway companies to state that whatever may have been the transactions of the companies at the commencement of railway enterprize, it is now generally regarded by them as impolitic to grant any preference tending to favour individual traders, and some managers disapprove of the transmission of large quantities of goods on more favourable terms than smaller quantities. The witnesses examined before us concur in the expression of their belief that there is no disposition on the part of the railway companies to afford personal preference for the special profit of individual traders; but that the distinctions in rates made by railway companies are based upon considerations affecting the profit and interest of the railway companies themselves. This, however, is a question of such vital importance, that we think it should not be left to the good intentions of the railway companies, but that any course which is practicable should be taken to ensure these intentions being carried into effect.

108. The best means of obtaining this desirable object is to ensure to the public a sufficient knowledge of all railway rates, charges, and dealings. This publicity would afford to traders of each district, who might consider that their district was unfairly taxed, a means of bringing their grievance forward. Unequal rates are the essence of the present Publication of Rates.

railway system, and as their discontinuance cannot be recommended, the remedy against unfairness or oppression must be sought in publicity.

Upon this subject the Railways Clauses Consolidation Act provides that—

"A list of all the tolls authorized by the special Act to be taken, *and which shall be exacted by the company*, shall be published by the same being painted upon one toll-board or more, in distinct black letters on a white ground, or white letters on a black ground, or by the same being printed in legible characters on paper affixed to such board, and by such board being exhibited in some conspicuous place on the stations or places where such tolls shall be made payable."

From the context of the Act it would appear that Parliament intended all charges actually made to be exhibited; but in practice the railway companies have only exhibited the tolls they are authorized to demand from persons using the railway, and not the charges which they make as carriers.

The absence of publication of the rates may in some cases prevent the traders from being aware of the rates at which other persons and goods are being carried. One case of this sort brought before us may be mentioned here:—The Midland Company made an agreement with all the brewers at Burton that they should all be on the same footing; but by some arrangement unknown to the other brewers one firm obtained a considerable drawback. The other firms, however, subsequently obtained a similar reduction.

If every trader possessed a full knowledge of the rates charged to himself and to others engaged in the same business, he would be in a position, if he felt himself aggrieved, to resort to the proper tribunal under the Railway and Canal Traffic Act; or if the matter was of sufficient magnitude, or of a public character, the interference of the Board of Trade could be sought, or the parties interested could submit the case to Parliament when the railway company sought new powers from Parliament, as already adverted to.

We therefore recommend that **in order to enable all persons to be in a position to ascertain with ease whether they are treated on an equality with others, it should be compulsory on the railway companies under adequate penalties to exhibit at every station, when required, to the persons using the station, a true list of the whole of the fares and rates charged from that station, and to give full information as to special contracts, rebates, drawbacks, and other deductions or advantages. The Board of Trade or other Government department charged with the supervision of railways should further be empowered to require returns of all tolls and charges actually levied by railway companies, with full information as to rebates and deductions, or to appoint officers to examine the books of the companies.**

Distances between stations.

109. Another matter bearing on this subject also deserves consideration. In order that the public may satisfy themselves that the rates are equitably charged, it is necessary they should know accurately the distances between the several stations. The Railway Clauses Act stipulates that the distances shall be legibly marked along the line, and that no tolls shall be payable unless this is done. But this provision is not a convenient one to convey the information, and therefore **we are of opinion that railway companies should be required, under adequate penalties, to publish accurate lists of the distances between the stations on their lines.**

3.—Actual Fares and Rates as compared with former Charges, and with corresponding Charges on Foreign Railways.

Difficulties of comparing English and foreign railways.

110. For many reasons it is very difficult to institute a just comparison between the accommodation afforded on foreign lines of railway and English lines. In the first place the circumstances of the traffic vary materially. An examination of passenger traffic on railways shows that in districts inhabited by persons pursuing similar avocations the numbers who travel may be assumed to increase with the amount of population and to diminish in an accelerating ratio according to the distance of the populations apart; therefore, in districts of similar character, the number of trains required between two places would increase with the number of inhabitants and diminish with the distance. But the condition and character of a population materially affect the passenger traffic. For instance, a working man dependent on his daily work can only afford to travel for such periods of time as would not interfere with his daily earnings, but he can afford, and finds it advantagous frequently to repeat, short journeys at a cheap fare. The more easy classes on the other hand can afford to make a large single payment at more limited intervals, to enable them to visit and remain at watering places and to travel for pleasure.

In England and Scotland the greatest development of the railway system has been in connexion with the fields of mineral wealth; moreover almost every railway passes either to a manufacturing district, which is connected with a much larger population than the mere town to which the railway runs, or to a seaport, in which latter case the traffic is influenced by the trade beyond the seas. Hence it is almost impossible to select places at home and abroad which would so correspond in the character of their population and traffic as to show whether the wants of the population were equally accommodated.

Before, however, instituting any comparison between English and continental railways, it is necessary to notice some distinguishing peculiarities of the French and other continental railway systems. Each continental Government has adopted a special mode of dealing with its railways, which more or less affects the position of the company which permanently or temporarily owns the line.

Peculiarities of French system.

111. In France, besides the general interest which the Government naturally takes, as a Government, in developing the trade of the country, it has a direct interest in this means of communication, as owner of the fields of mineral wealth of the country.

When railways were first introduced into France in 1836, the Government undertook to assist their construction by giving sums in aid and by constructing earthworks and bridges.

The railways are conceded to the companies in leases for 99 years, at the expiration of which period they become the property of the State; and in order that the debenture and share capital may be extinguished at the time the transfer takes place, a sinking fund is set aside out of the receipts from traffic, and from this fund a portion of the debentures and shares are annually paid off or bought up.

The various lines in France at work at the end of 1866 comprised about 9,014 miles, and had cost 319, 200,000*l.*, of which about 57,800,000*l.* had been contributed by the State, either in capital, permanent works, or subventions payable in annuities; and something over 2,200,000*l.* had been contributed by the localities in which the railways are situate, leaving about 259,200,000*l.* provided by the companies.

In addition to the advantage of these subscriptions the Government has guaranteed nearly all, if not all, the bonds issued by the companies. Sometimes the guarantee does not quite cover the cost of interest and sinking fund.

In return for this assistance the French Government has required the free performance of the postal service and the conveyance of military and other employés at very low rates. It has fixed lower maximum rates than in this country, and has required the companies to submit to considerable control both over the rates and fares for all classes of traffic, and over the management. The French Government also levies a duty upon traffic, of ten per cent. upon the gross receipts from goods carried by fast trains, and from passengers.

The policy of the French Government has materially protected the companies in that it has not allowed more railways to be made than it considered would adequately accommodate the districts, and whilst in France there is only one lineal mile of railway open to 26 square miles of country, in the United Kingdom there is one lineal mile open to about 8 square miles, and in England one to about 6 square miles of country. The result of this to the public in France is that (whilst it tends to ensure a full traffic to every railway) as a rule those who desire to travel over or send goods by railways have to pay, besides the railway fare, an additional and heavier rate for the road carriage; whereas in England a very limited amount of road carriage will now bring passengers or goods on to the railways, in any part of the country except in the mountainous and unproductive districts.

The commission appointed by the French Government to inquire into the construction and working of railways made a careful examination of the railway system in France and other continental countries and in England, and they made an elaborate report in 1863. This commission carefully considered the prohibition from charging special rates, or rates not authorized by the Government, (although lower than the tariff named in the "cahier de charges,") which is one of the main features of the French system of traffic; and they make some remarkable admissions upon the necessity of special rates as a means of developing the resources of the country. They do not however recommend them, because at the time the commission sat special rates had only recently been prohibited in France, on the ground that they were contrary to the principles of equality.

This interesting report shows into what great details of management legislation must enter when once the Government steps in to regulate the action of private companies in their dealings with the public.

It is, however, clear that no just comparison can be made between the French and English railways in respect of charges.

Belgian system.

112. In Belgium some of the lines have been constructed by the State and are worked by the Government, but there are lines conducted by private companies whose concessions have been granted on much the same conditions as have been applied to French railways, *i.e.*, they will become the property of the State after the lapse of a certain number of years, and their share and loan capital will be absorbed by a system of amortization.

Dutch system.

113. In Holland some lines have been constructed by foreign capitalists, but the State has laid out and constructed the main communications at its own cost; it retains its property therein and a certain control over them. It lets or leases the working of the lines to private companies. The agricultural nature of the country and the extensive system of water communication has materially retarded the progress of railways.

Austrian system.

114. In Austria concessions are granted by the Emperor for a fixed term not exceeding 90 years from the opening of the railway, when the property in the line and its appurtenances is to be passed over to the State in good working order, the property in rolling stock remaining with the company. The tariff of actual charges must be approved every three years by the Minister of Commerce, and when the net profits exceed 15 per cent. the Government can make reductions in the tolls authorized by the concession. The length of railway open in Austria in 1863 was 3,694 miles, upon which 65,057,677*l.* had been expended, which yielded an average dividend of $7\frac{1}{3}$ per cent. It would, however, appear that out of the total expenditure the Government has guaranteed interest on 50,000,000*l.* to induce individuals to invest their money.

Prussian system.

115. In Prussia 950 miles of railway have been constructed by the State at a cost of 14,944,431*l.*, and are managed by the Government; these lines yielded $7\frac{2}{3}$ per cent. in 1863; 877 miles have been constructed by private companies, at a cost of 15,885,854*l.*, and are managed by the Government, and yielded an average dividend of $5\frac{1}{2}$ per cent. in 1863; and 1,950 miles have been constructed and are managed by private companies at a cost of 32,636,758*l.*, and yielded an average dividend of $8\frac{1}{2}$ per cent.

The Executive Government gives the concession, and after the capital is raised the expropriation of land follows. The owner of land may appeal if dissatisfied to the courts of law, but such appeal does not stop the progress of the works. Competing lines are not allowed for 30 years after the opening of a railway. The conveyance of mails is to be without cost to the public. A constant supervision over the proceedings of the railway companies is exercised by commissioners. An income tax, varying from one-twentieth to one-fifth of the dividend, according to its amount, is levied and applied to amortizing the share capital of the private railways.

American system.

116. In America, on the other hand, the railway system is entirely free from Government control. Every facility is afforded for the construction of railways, especially as regards the acquisition of property, and in every respect the enterprize is left as free as possible; subject only to a maximum charge for conveyance, and to liability to make compensation for injuries.

The progress of railway communication in America has been far in advance of that in this country, but no just comparison can be made between the English and the American railways. The mode in which land is occupied is essentially different, the condition of society is also very different; in America only one class of passengers is recognized, except in the case of emigrants. There the railways form to a great extent the only main roads of the country. For certain classes of traffic, such as grain, they are in competition with a magnificent system of water communication, and where such competition exists the rates are very low; where there is no competition the rates are high.

English system.

117. The continental system is a paternal system, in which the Government overlooks and controls all the acts of the companies. The American system is one of complete freedom. Neither system is exactly suited to our requirements, or our character. But the English system is like the American, in so far as it is based on principles of freedom, and has relied on competition for keeping the rates low. This system has largely assisted the rapid development of our mineral wealth, and has given us a greater proportion of railway communication than is possessed by continental states; it has formed the main inducement to economy in working the traffic, and we cannot recommend any reversal of that policy by assimilating our system to that of the continent.

(*a.*) *Passenger Fares.*

Advantages of railways for passenger traffic.

118. The advantages which the public have derived from railways in passenger traffic are speed and comfort, and reduction of the actual cost of conveyance; the estimate of which depends on the manner in which railways are compared with other means of conveyance.

The richer classes have benefited most largely in point of cost, because the railways enable them to dispense with posting. The middle classes have also largely benefited, if the second class carriage be compared with the inside of a stage coach, and the third class with the outside. The poorer classes have benefited most in regard to speed, because formerly they had no means of travelling except by waggon or on foot; consequently a person dependent on daily earnings was practically unable to pass from one part of the country to another.

The average expense of posting was 2*s.* a mile with a pair of horses, and coaching fares before the introduction of railways were stated by Mr. Chaplin, in his evidence before the Select Committee of the House of Commons on Railroads in 1838, to have been 4½*d.* per mile inside, and 2½*d.* per mile outside, to which the incidental fees and charges would have to be added.

Comparison of fares and accommodation in 1845 and 1866.

119. The subjoined table of railway fares between the places named, in November 1845 and in August 1866, show what changes have been made by some of the railway companies in their own rates of charge.

FARES on RAILWAYS on 15th November 1845 (extracted from Report of Officers of the Railway Department of the Board of Trade for the Year 1844–45) and in Autumn of 1866.

(The distances in parentheses are shorter distances consequent on the construction of new lines).

* This is Government fare, the ordinary 3rd class is 4*s.* 8*d.*

† This is Government fare, the ordinary 3rd class is 6*s.* 4*d.*

It will be perceived that between London and Birmingham in 1845, the company charged first-class express 27*s.*, at an average speed of 37 miles an hour; and ordinary first-class 23*s.* and second-class 17*s.*, at an average speed of 28 miles an hour; and 20*s.* and 14*s.* by what were termed slow trains, proceeding at an average speed of 14 miles per hour.

The company now charge 20*s.* first-class, 15*s.* second-class, and 9*s.* 5*d.* third-class for all trains. The maximum speed of such trains is 37 miles per hour, and the minimum speed 20 miles per hour.

In 1845 there appears to have been one mail train and one express train daily. The number of trains at 37 miles an hour is now five each way daily by this line; but to this must be added the two trains each way daily at a similar speed on the Great Western Railway.

The Great Western Railway Company charged from Paddington to Bristol in 1845 by express train 30*s.* first-class and 21*s.* second-class; by ordinary trains 27*s.* first-class,

18*s.* 6*d.* second-class, and 9*s.* 11*d.* third-class, with an average speed for all trains of 26 miles an hour for ordinary trains, and 14 miles an hour for parliamentary trains.

The company now charge 20*s.* 10*d.* first-class, 15*s.* 8*d.* second-class, and 9*s.* 10*d.* third-class. The fastest train runs at an average speed of 42 miles an hour, and the slowest at 16 miles an hour; the average speed of all trains being about 28 miles per hour.

The fares between Birmingham and Gloucester were in 1845 14*s.* first-class, 10*s.* 6*d.* second-class, and 4*s.* 5*d.* third-class, with an average speed for trains conveying first and second-class passengers, of 20 miles an hour, and for trains with first, second, and third class passengers, of 17 miles an hour, with 14 trains per day.

The charges now made by the Midland Railway Company between the same places are 10*s.* for first-class passengers, 7*s.* 6*d.* for second-class passengers, and 4*s.* 7½*d.* for third-class passengers; the distance has been increased three miles by the station having been carried into the centre of Birmingham, and the speed of the trains remains about the same, with 18 trains per day.

On the South-eastern Railway from London to Dover the fares charged in 1845 were 18*s.* first-class express, 15*s.* first-class and 10*s.* second-class by ordinary trains, with an average speed of 23½ miles per hour, and 6*s.* with an average speed of 16 miles per hour third-class; whereas now the company charges 19*s.* first-class express, 17*s.* 6*d.* first-class and 12*s.* second-class by ordinary trains, and 6*s.* 6*d.* third-class, the maximum speed being 45 miles per hour, the minimum speed 24 miles per hour, and the average speed 32 miles per hour.

The Newcastle and Carlisle Railway Company charged in 1845 12*s.* for first-class, 9*s.* for second-class, and 5*s.* for third-class, with an average speed of 18½ miles per hour, with 10 trains per day. The North-eastern Railway Company now charge, between Newcastle and Carlisle, 12*s.* 9*d.* first-class, 10*s.* 2*d.* second-class, and 6*s.* 4*d.* third-class, with an average speed of about 20 miles per hour, and the number of trains is not increased.

These instances may be taken to afford a fair sample of the alterations in accommodation. The main improvement in the accommodation afforded by the railways to the first and second class passenger traffic of the country which has taken place in the last 20 years has been in the description of vehicles and the larger number of railways opened; however between places where competing lines have been established there has been a great extension of facilities, as has been already shown between London and Birmingham. But much improvement in the number or speed of trains has not taken place between places which had railway communication 20 years ago, and have not had the advantage of competing lines. The reduction of fares has mainly arisen from the issue of return tickets for extended periods of time proportionate to the distances, which are a great boon to the trading community. As regards the third class, the number of third-class trains has not materially increased, except in the vicinity of large towns, and no return tickets are as a rule issued to this class; but on the other hand an entirely new description of traffic has sprung up, viz., the excursion trains, which afford a very great amount of accommodation to the poorer classes.

Second and third class traffic.

120. The published statistics of passenger traffic appear to show that the second and third classes are the sources of passenger traffic which admit of the greatest development. On the London and North-western Railway a comparison of 14 years * showed that with an increase of mileage of 166 per cent. the number of miles run by the passenger trains had increased 152 per cent.; and that whilst the total increase of passenger receipts had only been 78 per cent., the receipts for first-class had increased 40 per cent., for second-class 74 per cent., but the third-class had increased 162 per cent, that is to say, it alone had kept pace with the increased mileage.

Comparison of accommodation on English and foreign lines.

121. In the evidence which we have received complaints are made that the passenger rates are higher in this country than abroad.

The very different conditions under which English and foreign railways are placed render it impossible to make any absolute comparison between them. The amount of accommodation afforded may however be to some extent tested by comparing the receipts per train mile, the number of trains, the average fares, and the speed of the trains.

Receipts per train mile.

122. *Receipts per train mile.*—The average gross receipts per train mile will give a rough idea of the general accommodation afforded; as, supposing the charges not to be

* Mr. Stewart, Quest. 14,796.

materially different, the higher these receipts are, the fewer will be the number of trains in proportion to the amount of traffic carried; and *vice versâ*.

These receipts we find as follow:—

	s.	*d.*
In Great Britain the Board of Trade returns for 1865 give	5	1·74
For 1864	5	3·22
For France we possess no statistical returns to enable us to calculate the average over the whole kingdom, but from the periodical reports of some of the principal companies, and from information specially furnished to us, we arrive at the following:—		
Lyons and Mediterranean (Appendix DB.)	10	2
Nord	7	4
Orleans	8	5
Ouest	7	11
Est	5	10
For Belgium the "compte rendu des operations" on the railways of the state for 1864, gives	6	3
For Prussia the "statistische Nachrichten" for 1864, give, on the whole of the railways of the country	5	9
For Austria a return of some few years old gives for the State railways in that country	5	4
Many other German returns which we have do not appear to make the train mileage an element in their data.		

It will thus be seen that in every case the foreign average receipts per train mile are larger than in Great Britain, in some cases very much larger.

123. But in order to compare the accommodation more directly, we have extracted from various foreign official time tables the data given in Appendices DM. and DN. These documents show in a perspicuous form the particulars of the railway service in several parts of the continent, and its comparison with the service of a corresponding nature in this country. The latter is also shown in a different form in Appendix EE. Number of trains.

Number of Trains.—As regards France, the statements show that in almost every instance, where any comparison can be drawn, the number of trains for first and second class passengers is much greater in this country than in France.

For example—

	First-class Trains, daily.	Second-class Trains, daily.
From Paris to three large naval arsenals there are	8	4
From London to three large naval arsenals there are	32	22
From Paris to six commercial sea-ports there are	32	21
From London to six commercial sea-ports there are	61	56
From Paris to seven suburban districts there are	141	141
From London to seven suburban districts there are	266	266
From Paris to three large provincial towns there are	23	16
From London to three large provincial towns there are	51	51
From Paris to 10 smaller provincial towns there are	66	40
From London to 10 smaller provincial towns there are	101	83

As regards third-class trains, however, the result is different, the French giving generally for long distances more accommodation than we do.

For example,—

	Third-class Trains daily.
From Paris to 6 commercial sea-ports there are	17
From London to 6 commercial sea-ports there are only	13
From Paris to 3 large provincial towns there are	13
From London to 3 large provincial towns there are only	9
From Paris to 10 smaller provincial towns there are	37
From London to 10 smaller provincial towns, only	26

In Belgium, Germany, and Italy, it will be seen by Appendix DN., the same general result is found as in France, viz., a less number of trains for first and second-class passengers than in England, but a greater number of third-class trains. In Prussia there is a fourth class, at very cheap fares.

Fares.

124. *Amount of Fares.*—The average passenger single fares in Great Britain are as follows, in pence per mile:—

	Express.		Ordinary.		
	First Class.	Second Class.	First Class.	Second Class.	Third Class.
On 12 of the principal railways of England, as as given in the Board of Trade Return for 1865—	*d.*	*d.*	*d.*	*d.*	*d.*
Great Eastern	2·87	2·00	2·35	1·87	0·97
Great Northern	None.		2·13	1·06	0·99

	First Class.	Second Class.	First Class.	Second Class.	Third Class.
	d.	*d.*	*d.*	*d.*	*d.*
Great Northern	No Express.		1·31	0·93	—
Lancashire and Yorkshire	Do.		1·63	1·27	0·54
Midland	Do.		1·39	1·07	0·86
North-eastern	Do.		0·70	0·50	0·30
South-eastern	1·51	1·04	1·04	0·76	0·49

The passenger fares in France are stated in Appendix DM. It will be seen they are very uniformly, as follows:

—	Express.		Ordinary.		
	First Class.	Second Class.	First Class.	Second Class.	Third Class.
	d.	*d.*	*d.*	*d.*	*d.*
Usual fares in France	None.		1·73	1·30	0·95

The only exceptions to this uniform rate seem to be in the cases of some of the suburban districts, where the fares are lowered.

The passenger fares in Belgium, Germany, and Italy, are shown in Appendix DN, and may be stated as follows:—

—	Express.		Ordinary.			
	First Class.	Second Class.	First Class.	Second Class.	Third Class.	Fourth Class.
Belgium.	*d.*	*d.*	*d.*	*d.*	*d.*	*d.*
Usual Belgian fares as given in Appendix M.	1·55	1·16	1·23	0·93	0·62	None.
Brussels to Antwerp	1·37	—	1·17	0·80	0·55	Do.
Germany.						
Prussia	2·06 to 1·70	—	1·57	1·17	0·80	0·40
Austria	2·25 to 2·01	—	1·87	1·41	0·94	None.
Bavaria	1·60	—	1·33	0·89	0·60	Do.
Rhenish	None.		1·53	1·05	0·70	Do.
Italy.						
Highest	Do.		1·88	1·50	1·02	Do.
Lowest	Do.		1·47	1·19	0·85	Do.

As respects passenger fares, therefore, it will be seen that many of the continental fares, particularly first and second-class, are lower than the fares in this country. But there are several circumstances to be taken into account before giving too much weight to this consideration.

Return tickets.

125. In the first place, return tickets are issued more generally in this country than abroad, and usually on more liberal terms.

The general rule in England (*see* returns to Inquiry No. 5 in Appendix) is to give first and second-class return tickets at a reduction of about 25 per cent. Third-class return tickets are given in some few places, but only exceptionally.

In France, it appears (*see* Appendices CN. and DB.) that return tickets are issued for certain limited distances from large towns, to facilitate the traffic between them and their suburbs, and in some other cases where the railway route is circuitous, the reduction being 30 per cent. Return tickets are, however, not given for long distances.

In Belgium (*see* Question No. 3060) return tickets are only issued in an exceptional way.

In Germany the practice varies, return tickets being given in some places, but not as a general rule.

Excursion trains are more frequent in this country than on the continent. In some instances the fares by such trains in England do not average $\frac{1}{3}d.$ or $\frac{1}{4}d.$ per mile travelled.

Excess of luggage.

126. The regulations as regards luggage are more liberal in this country than on the continent.

In Great Britain the usual rule is to allow each passenger to carry free of charge—

First class -	- 112 to 120 lbs.
Second class -	- 100 lbs.
Third class -	- 56 to 60 lbs.,

excess being paid for at the rate of 10*d.* to 1*s.* 3*d.* per ton per mile.

In France (*see* Appendix CH.) each passenger, independent of class, is allowed 30 kilogrammes, or 66 lbs., and excess is charged for at the rate of about 8*d.* per ton per mile.

In Belgium no luggage is allowed free beyond such hand articles as can be placed under the seats without inconvenience to the passengers. All else is charged at the rate of about 9*d.* per ton per mile.

In Germany the usual rule appears to be, for all classes, about 50 lbs. free, and about 8*d.* to 1*s.* per ton per mile extra.

Mr. Eborall shows in his evidence the extent to which the French charge for excess luggage would tend to equalize the fares in the two countries, assuming every passenger to travel with the quantity allowed in England; and although this assumption is of course exaggerated, there can be no doubt that, in the long run, the less liberal arrangements abroad with luggage tend to make the difference in the cost of travelling less marked than it would at first sight appear.

Speed.

127. *Speed of Trains.*—The speeds of trains in Great Britain and on the continent are shown in a large number of examples in Appendices DM. and DN.

	Miles per Hour.
In England the express trains run generally, including stoppages, about -	40
From London to Newcastle the quickest trains run - - - -	40
„ „ Liverpool - - - - - - -	37
„ „ Bristol - - - - - - -	42
„ „ Southampton - - - - - -	34
„ „ Peterborough - - - - - -	47
„ „ Birmingham - - - - - -	38
„ „ Brighton - - - - - -	46
The average of all the English examples of the quickest trains in Appendix DM., omitting the suburban, gives - - - - -	36½
The ordinary trains in England run generally, including stoppages, about -	18 to 30
The average of all the English examples of the slowest trains in Appendix DM. gives - - - - - - - - -	19½
In France the express trains run, including stoppages - - -	25 to 35
The quickest in Appendix DM. is, from Paris to Rouen - - -	36
The average of the quickest examples, omitting suburban, is - - -	31
The ordinary trains run from - - - - - -	16 to 25
The average of all the slowest trains in Appendix DM. is - - -	18

	Miles per Hour.
In Belgium the quickest trains run from	29 to 35
„ the slowest	18 to 23
In Prussia the quickest	29
„ the slowest	17 to 21
In Austria the quickest	20 to 29
„ the slowest	14 to 21
In Bavaria and along the Rhine the quickest	24 to 32
„ „ the slowest	13 to 24
In Italy the quickest	24 to 30
„ the slowest	15 to 24

128. To complete, however, any comparison it would be necessary to compare the comfort afforded on English lines in the number of passengers in proportion to the number of carriages, as well as in the arrangements to prevent the passengers from being subject to change of carriages at junctions, with the rigid system prevailing on French and other continental lines, by which the passengers are made entirely subordinate to the convenience and economy of the railway companies. General results of the comparison.

In comparing the passenger traffic in England and in France, it would appear generally that first-class passengers in England availing themselves of through fast trains for long distances are carried at higher speeds, (at somewhat higher fares, regard being had to the charge for luggage made in France, and to the more limited issue of return tickets), but in France persons travelling by ordinary trains or third-class trains are carried at a lower rate than in England, and with more frequent trains.

Mr. Stewart gives the following detailed comparison between the French and English railway accommodation:—

"I have taken two of the French railways and two of the English railways as specimens, the North-western and the Manchester, Sheffield, and Lincolnshire, and I find that this would be the result:—Passengers travelling by the London and North-western from London to Leighton, and by the Manchester, Sheffield, and Lincolnshire railway from Manchester to Sheffield, or by the Paris and Mediterranean from Lyons to St. Rambert, or Lyons to Macon, are supplied with train accommodation and charge as follows:—From London to Leighton, which is a distance of 40½ miles, there were 10 first-class trains, allowing 112 lbs. of luggage, at 7*s.* 2*d.*; 10 second-class trains, allowing 100 lbs. of luggage, at 4*s.* 8*d.*; and one third-class train, allowing 56 lbs. of luggage, at 3*s.* 5½*d.* On the Manchester, Sheffield, and Lincolnshire line, from Manchester to Sheffield, which is a distance of 41¼ miles, there were seven first-class trains, allowing 112 lbs. of luggage, at a fare of 9*s.*; seven second-class trains, allowing 100 lbs. of luggage, at a fare of 6*s.* 3*d.*; two third-class trains, allowing 56 lbs. of luggage, at a fare of 4*s.* 6*d.*; and one Parliamentary train at a fare of 3*s.* 5½*d.* From Lyons to St. Rambert, which is a distance of 37½ miles, there are four first-class trains, allowing 112 lbs. of luggage, at a fare of 6*s.* 6½*d.*; four second-class trains, allowing 100 lbs. of luggage, at a fare of 4*s.* 11¼*d.*; and four third-class trains, allowing 60 lbs. of luggage, at a fare of 3*s.* 3*d.* I have added the charge for luggage, bringing them up to the English standard. They can travel, therefore, in France four times by third-class for 3*s.* 3*d.*, as against once by the North-western for 3*s.* 3½*d.*, and three times by the Manchester, Sheffield, and Lincolnshire for 4*s.* 6*d.*, and 3*s.* 5½*d.* as against 3*s.* 3½*d.*; so that, compared with the fares on the English lines, and adding the charge for extra luggage (52 lbs.), the first-class passenger in France pays 7½*d.* less for the 41¼ miles than on the London and North-western, and 2*s.* 5½*d.* less than on the Manchester, Sheffield, and Lincolnshire line. The second-class passenger in France, adding the charge for extra luggage (40 lbs.), pays 3¼*d.* more than on the London and North-western, but 1*s.* 3¼*d.* less than on the Manchester, Sheffield, and Lincolnshire. The third-class passenger in France, with the right of carrying 60 lbs. of luggage as against 56 lbs. on the English lines, may travel from Lyons to St. Rambert by four trains per day, and from Lyons to Macon by eight trains per day, for 3*s.* 3*d.*, or 2½*d.* less than the Parliamentary fare on the English lines, and 1*s.* 3*d.* less than the ordinary third-class on the Manchester, Sheffield, and Lincolnshire line.

"Then I have compared the number of trains between some of the points. In England of course there are duplicate lines of railway, but I have taken one route only, London to Glasgow, London to Aberdeen, Tring to Rugby, London to Leighton, Paris to Marseilles, Melun to Larache, Lyons to Macon, and Lyons to St. Rambert. There are four communications from London to Glasgow, which is a distance of 406½ miles. The third-class passengers are carried by a fast train at 9 p.m. There is no third-class train goes through. There are three fast trains advertised from London to Aberdeen, which is a distance of 542¼ miles. The third-class are conveyed by one of those. From Tring to Rugby, which is a distance of 51 miles, there are seven communications a day. From London to Leighton, which is a distance of 40½ miles, there are 11 communications per day. From Peterborough to Doncaster, which is a distance of 80 miles, there are eight communications, of which three are third class, four are fast, and one is ordinary. From Paris to Marseilles, which is a distance of 538 miles, there are six trains, namely, three fast, one ordinary, and two third-class per day. From Melun to Larache, a distance of 70 miles, there are eight trains per day. From Lyons to Macon, a distance of 45 miles, there are 12 trains per day, consisting of three fast, one ordinary, and eight third class.

From Lyons to St. Rambert, a distance of 37½ miles, there are eight trains per day, consisting of three fast, one ordinary, and four third class.

"These facts lead me to the conclusion that the French, as a rule, give more frequent means of intercommunication to the third class between the stations upon their railways than we do."

The low prices charged on the Belgian railways are somewhat remarkable. There it would appear as if the conditions more nearly resembled districts in England. Special rates prevail between certain places, and it is stated that a considerable increase of traffic has followed the reduction which has from time to time been made in the rates; notwithstanding which the profit on the capital cost of Government lines yields 6 per cent. interest. At the same time every one who has travelled in Belgium has seen how very defective the stations and platforms are in accommodation as compared with those on English lines.

Punctuality.

129. An important element in accommodation to passengers is the punctuality of the trains; unpunctuality is a great element both of inconvenience and of danger.

Most of the railway companies issue a notice in their time bills to the following effect:—

"The published time-bills of this company are only intended to fix the time at which passengers may be certain to obtain their tickets for any journey from the various stations, it being understood that the trains shall not start from them *before* the appointed time. Every attention will be paid to ensure punctuality, as far as it is practicable, but the directors give notice that the company do not undertake that the trains shall start or arrive at the time specified in the bills; nor will they be accountable for any loss, inconvenience, or injury which may arise from delays or detention. The granting of through tickets to places off the company's lines is an arrangement made for the greater convenience of the public, but the company will not hold themselves responsible for any delay, detention, or other loss or injury whatsoever arising off their lines, or from the acts or defaults of other parties, nor for the correctness of the times over other lines or companies, nor for the arrival of this company's own trains in time for the nominally corresponding trains of any other company. Passengers booking at intermediate stations can only do so conditionally upon there being room in the train."

The question of the punctuality of passenger trains has been frequently discussed by Parliament. The House of Commons Committee in 1858 on Railway Accidents, recommended that passengers should be enabled to recover from the companies summarily penalties for unpunctuality.

We have understood that on the Swiss railways the Government enforces a penalty upon every train which arrives late at the terminal station, proportioned to the degree of unpunctuality.

If, however, a railway company be bound under a penalty always to keep time, it must provide in its time bills for a certain amount of overtime to guard against exceptional cases; and it would thus materially reduce the speed which it now endeavours to give, so long as the passenger is content to bear the contingency of delay. If, however, great expedition were required of the companies the efforts of the officers of the companies to maintain punctuality in exceptional cases would enhance the risk of railway travelling; and it would require a protection analogous to that obtained on the French lines by the regulations as to booking, with or without luggage, and placing the passengers under control for a certain time before departure.

If the same speed as is now shown on time bills were to be guaranteed, the companies would be obliged to provide means for running a much greater speed on occasions. Hence guaranteed punctuality means either increased expense of working, which must be paid for by increased fares, or diminished average speed in the trains. It is for consideration, however, whether the number who would desire guaranteed punctuality with such conditions exceeds the number who would prefer the system to remain as it is. After a very careful consideration of this question, **we are unable to see any method of ensuring punctuality in passenger trains by means of legislative enactments, except that proposed by the Committee of the House of Commons in 1858, viz., that punctuality should be guaranteed, and that passengers injured by delay should be enabled to recover summarily a fixed sum; but we have already referred to the objections to this proposal.**

Notice of alteration of time.

130. It is the usual practice for railway companies to publish time tables at the beginning of each month, but not to give previous notice of any alterations. This often causes much inconvenience; and therefore **we are of opinion that railway companies should be bound, under adequate penalties, to give at least a week's notice of any alterations of time of their regular passenger trains.**

131. The Commission appointed by the French Government dwelt in its report at some length upon the advantages which result from increasing the comfort and reducing the cost of travelling. They inveighed against the feeling which prevailed in France, and which has prevailed quite as much with us, of making the lower classes uncomfortable in order to drive into a higher class those passengers who the managers of the railways considered should have travelled in that higher class. They urged that persons generally select the class in which they travel, with the object of meeting others of their own rank in society. The inconvenience to which second and third class passengers have been subjected has diminished the inducement to travel in persons who would naturally have travelled in those classes, whilst it is the interest of railway companies to encourage travelling, and to draw their traffic from the lower classes of the population, who are the most numerous. Desirability of encouraging travelling in the inferior classes.

The Commission further urged the want of expansion in the passenger traffic on French railways as an illustration of the absence of encouragement to this traffic, and showed that whilst in 10 years the receipts from passengers had only increased from 16,814 francs to 17,980 francs per kilometre, the receipts from goods had increased from 12,411 francs per kilometre to 30,060 francs. They considered that this was partly attributable to the fact that the average fare per passenger had remained stationary at about 0·9*d.* per mile, whilst the price for goods and minerals per ton per mile had been decreased from 1·2*d.* to 0·9*d.*, and they argued that the probable cause of the want of expansion of the passenger traffic was that the fares have been kept up too high.

They laid down as a rule that every passenger ought to be able to sit comfortably, and have a back to his seat against which he could lean his head to sleep; that in summer the passengers should be adequately protected against the rays of the sun, and that in winter, if some general and inexpensive system of warming could be adopted, which did not delay the trains, it should be applied to all carriages. They also recommended the universal adoption of waterclosets in trains.

It is, however, obvious that whilst the first-class long distance passenger traffic is probably better provided for in this country than anywhere else in the world, the working classes do not obtain that benefit from railway communication by the ordinary trains of the companies which a railway is so well calculated to afford.

In the last session of Parliament the late President of the Board of Trade introduced a Bill which provided, amongst other things, for compelling all metropolitan railway companies to run trains before seven o'clock in the morning and after six o'clock in the evening to and from stations to be prescribed by the Board of Trade at prices not exceeding one penny for each journey. Periodical tickets only (for not less than a week) to be issued for such trains, and the liability of the company for injury to passengers from accidents to be limited to 100*l.* for each passenger. The company was to be relieved from the necessity of running the trains if the number of passengers by the trains did not amount to 100.

In consequence of the pressure of public business the Bill was not passed.

We recommend that railway companies should be required to afford greater facilities for carrying the ordinary third-class traffic, by running at least two trains, with third-class carriages attached, each way daily; and that in such mixed trains whenever return tickets are issued for first and second class passengers, they should in like manner be issued for third-class passengers. We consider that workmen's trains, on the principle of those proposed in the Railway Clauses Bill of the Session of 1866, should be run in and out of every large manufacturing town.

132. By Act 7 & 8 Vict. c. 85. it is enacted that cheap trains are to be run on "passenger railways," of which we have already quoted the definition given in the Act. Definition of passenger railway.

But inasmuch as goods and mineral traffic is increasing at a much larger rate than passenger traffic, it is probable that the more important railways will soon be exempt from the conditions now applied to passenger railways, and therefore we are of opinion that **the definition of the term "passenger railway" in the Act for the regulation of railways should be altered, and the term defined to mean any railway on which passengers are conveyed.**

133. The price to be paid for military and police is fixed by the Act for the Regulation of Railways at 2*d.* per mile for officers and 1*d.* for privates; the authorities of the War Office have complained that where railway companies are actually charging lower fares Military and police.

for first and third class passengers they exact the statutory amount from the military. **We are of opinion that in no case should a railway company be entitled to charge more for the military and police than it charges for ordinary first and third class passengers.**

Postal service.

134. In connexion with the passenger traffic we have to consider the question of postal communication.

On the continental railways, as we have observed, the Government has conceded the lines to the companies on the condition that the mails are to be carried free. On the railways of this country Parliament has reserved to the Post Office the right of requiring the railway companies to carry the mails as the Postmaster General may direct, but has reserved to the railway companies the right to be paid for such service at a rate to be fixed by arbitration. The Postmaster General is also at liberty to send a Post Office guard with a weight of mails equal to the luggage of an ordinary passenger, at the fares charged for such ordinary passenger, any extra weight being paid for according to the ordinary rates of the company.

The Post Office authorities complain that the price they have to pay under many of the arbitrations for services rendered is in excess of what individuals pay for such services and that if guards are sent in charge of the mails as baggage the railway companies insist that the guard can only carry the baggage from one end of his journey to the other without intermediate receipt and delivery, and that, therefore, when they desire to use the trains by sending a guard with mail bags, without putting the trains under the statutory notice, the demands of the railway companies are exorbitant. They also state that they cannot require a company to run a train exclusively for their use, and that the law is defective as to the speed they are entitled to require, and as to the provision of apparatus for exchanging mail-bags without stopping.

The railway companies on the other hand complain that whilst by law the award should bind both parties for three years, the Post Office practically possesses the power of at once putting an end to it if they consider it too high, by requiring some alteration of service, which may be a mere nominal alteration, and thus the Post Office may go on asking for fresh arbitrations until they get an award to their liking. The Post Office authorities deny that there has been any abuse of this power. The railway companies further complain that by means of the book and parcel post, the Post Office has entered into competition with the railway companies for an important branch of their traffic.

The Post Office is anxious that a fixed tariff for the conveyance of mails should be introduced into Acts of Parliament. The experience which has been already acquired must by this time suffice to enable a fair and remunerative tariff to be affixed to every service required to be rendered by the ordinary trains of the company, and the only reason why some fixed scale does not appear to have been adopted by some general Act, is that the Post Office has never urged it upon the consideration of Parliament on a satisfactory basis for legislation.

It is quite clear, however, that at the present time legislative interference in this question has either gone too far or not gone far enough. If the Post Office had originally been left free to make its bargains with railway companies, it would probably have obtained greater facilities at lower rates than it now possesses, for the railway companies largely benefit by postal communication, and the feeling of the directors would obviously be to assist it; but the fact of the service being compulsory to some extent neutralizes such a feeling.

We recommend as the best course under existing circumstances **that a general Act of Parliament be passed to define all those points which have given rise to difficulties between the Postmaster General and the railway companies; but we do not deem it expedient to enter into the details of the arrangements to be embodied in the Act.** We will merely point out that these services may be classed under two heads, viz., first, services analogous to services rendered to the public; secondly, services in trains to be run at special hours to be fixed by the Postmaster General.

The first class, viz., **services by trains when railway companies fix the time of starting and stopping, may be grouped under the following heads, viz.—**

1. **Mails in charge of railway companies without Post Office guards.**
2. **Mails in charge of guards on Post Office responsibility.**
3. **Compartments or one or more carriages.**

For this class of services a tariff might be fixed by a general Act. And if the Postmaster General were to enter into communication with the railway companies, we see no reason to doubt that an equitable scale for these services could be agreed upon.

For the second class of services, viz., **where the Postmaster General fixes the time of starting or stopping, or requires an exclusive or limited train, the question of the proper remuneration for the service performed should still be left to arbitration.**

We have no evidence that the provisions of the Act which we have quoted in a former part of our report, allowing the Postmaster General to over-ride an award which is otherwise binding on a railway company, have ever been abused by him. We think such a power necessary for the public interests, and have not, therefore, suggested any alteration of the law in this respect.

Parcels.

135. Another branch of traffic carried on in passenger trains is the conveyance of parcels. The railway companies complain that the Post Office abstracts from them a large portion of this class of traffic, by means of the parcel post. The Post Office contend that the necessity for extending the parcel post has arisen from the inefficient way in which the railway companies have performed the parcel service; and the services, which the Post Office under its Acts of Parliament is entitled to perform, seem to be limited to printed and written matter and patterns.

We think that there is a plain and obvious distinction between the service rendered by the Post Office in the conveyance of letters and printed matter, and that rendered by railway companies in conveyance of parcels. The Postmaster General not only enjoys by law an exclusive monopoly of the conveyance of all letters, but is also entirely protected from all responsibility for any default in the service which the Post Office undertakes to render to the public, and correspondents are left to rely in the last resort on the protection of the severe penal laws against the servants of the Post Office.

We do not think it would be possible to apply this principle to the conveyance of parcels throughout the country.

There is this further consideration that the weight of letters received and delivered in each separate packet is exceedingly small, both in weight and bulk, as compared with the bulk and weight of railway parcels, which extend up to 112 lbs., and require therefore a different organization for receipt, delivery, and forwarding.

So long as a railway company is paid a reasonable rate for the transmission of mails they have no cause to complain of the extension of Post Office service. The expense lies in the collection and delivery, and it is quite competent to railway companies to organize a system of collection and delivery, and to compete with the Post Office by carrying parcels on the same terms. It is, moreover, to be remarked that railway companies are not bound to carry parcels, nor is there any tariff for parcels, fixing charges for collection and delivery, in Acts of Parliament. The public is therefore at their mercy. **We consider that a separate tariff should be laid down and published to govern the conveyance as distinguished from the collection and delivery of parcels, so as to enable the rates of charge to be kept down by the free action of individuals acting as carriers by railway.**

It is, however, apparent that the parcel service, so far as interchange is concerned, can never be efficiently performed for the public until railway companies co-operate through the clearing house, to improve their arrangements for parcel traffic. Looking at the extent to which the railway system has now reached **we consider that the time has arrived when railway companies should combine to devise some rapid and efficient system for the delivery of parcels.**

We do not feel called upon to suggest the precise manner in which this may be carried into effect; but the employment of a uniform system of adhesive labels for parcels, somewhat similar to that now in use on some of the northern lines for the conveyance of newspapers, is one of the most obvious methods for facilitating payment and accounting.

If the railway companies do not combine voluntarily it may be necessary at some future time for Parliament to interfere to make the obligation to carry parcels compulsory at a rate to be prescribed by law.

On the companies effecting such an arrangement we recommend that a general Act should be passed limiting their liability for each parcel to a certain amount, unless a greater value be declared and paid for, according to a settled scale, at the time of transmission, and that such further provisions should be made as may be found necessary to enable the companies to carry out their arrangements.

(*b.*) *Goods and Mineral Rates.*

Running powers.

136. We have already pointed out that Parliament appears to have consistently legislated for railway companies on the principle that on the one hand they are owners of roads, which the public are entitled to use, whilst on the other hand they are commercial companies engaged in the business of common carriers. And that in return for the privilege of compulsorily taking land, Parliament has required every company, in its capacity of the owner of a road, to specify in its Act authorizing the railway, a scale of tolls, on payment of which independent carriers and the public in general shall be entitled to use the road with engines and carriages; and that Parliament has also provided that the owners or occupiers of lands adjacent to the railway, or other persons may make branch lines with suitable access to the railway. We have also shown that the powers given to all persons to use the railway are, however, practically inoperative, because there is no provision in the Acts for securing the use of water, cranes, sidings, or platforms belonging to the company. Hence, the use of one railway by other persons or by a company owning another line can practically only take place (except for short distances) with the consent of the company, except in cases where these rights, and a power of arbitration to enforce them, have been secured by the special Act regulating the use of the line.

The power of making junctions is not only subject to certain inconvenient restrictions, but the rate of tolls for the use of the line is so much higher in proportion to that which is paid to the company when it undertakes the entire business of carrying over its lines, that no disposition has been evinced by the public in general to use railways as if they were common highways, at the prescribed rate of tolls. As a rule, the use of railways for the traffic of the public in general, by other than the owners, has been limited to companies having adjacent railways, the junctions of which are made a matter of special application to Parliament.

In dealing with applications of this nature Parliament has largely adopted the practice of allowing a new company which proposes to effect a junction with an established company to use the line of the established company for a certain distance, and this even in cases where there is a direct competition between the companies.

These "running powers," as they are termed, are generally given with a view to afford the new company access to some station without the necessity of constructing an additional line.

The terms on which the line is to be used are generally left to be fixed by arbitration, and the following is an example of a clause used in Acts of Parliament for this purpose, viz.:—

> It shall be lawful for the ———— Railway Company to run over and use with their own engines, carriages, and servants so much of the railway of the ———— Company as is ————, together with the stations, sidings, works, and conveniences connected therewith, upon such terms and conditions as may be agreed between the same company and the ———— Company, or in default of agreement may be settled and determined by an arbitrator to be appointed by the ———— on the application on either company.

It must be assumed from these provisions that Parliament has intended to enable the established company to obtain a fair compensation in each case for the capital it has expended.

Railways are authorized to carry goods.

137. Similarly Parliament has required railway companies in their capacity of carriers to name a maximum mileage rate at which they will undertake to convey passengers and goods, and to afford all reasonable facilities for receiving, forwarding, delivering, and interchanging traffic without undue or unreasonable preference in favour of any person or company or description of traffic.

In their aspect as carriers, the railway companies, instead of being dependent for their profits upon a simple system of tolls levied upon the persons who use the railways, have been permitted and encouraged by Parliament to make such charges within an authorized maximum rate as they consider best calculated to produce the largest profit.

But are not bound to carry them.

138. It is important, however, to observe that the railway company only obtains a permissive right to charge a maximum rate for the goods it elects to carry, and is not bound to carry every class of goods or minerals which may be offered to it by the public.

Thus railway companies who become carriers may decline to carry such classes of articles as they think fit; and as the railways are not ordinarily accessible to the use of private persons with their engines and carriages, the public fail to obtain the benefit of those provisions of the general Act (except so far as the companies may choose to afford them) empowering all persons to use the railways, which were intended to render the railways a general means of conveyance.

139. Considering how much of the whole traffic of the country must now go by railway, **we recommend that railway companies should be bound by law to provide means of conveyance for, and to convey, all articles tendered to them, subject to such restrictions as the circumstances of the railway may require, which should be defined by byelaws to be approved as provided by the Act for the Regulation of Railways.** Recommendation.

140. There is a class of goods for which, however, special provision has been made by the existing law, viz., "dangerous goods,"—such as gunpowder and other explosive or highly combustible articles. The following is the present law in this matter:— Dangerous goods.

"No person shall be entitled to carry, or to require the company to carry, upon the railway any aquafortis, oil of vitriol, gunpowder, lucifer matches, or any other goods which, in the judgment of the company, may be of a dangerous nature; and if any person send by the railway any such goods without distinctly marking their nature on the outside of the package containing the same, or otherwise giving notice in writing to the book-keeper or other servant of the company with whom the same are left, at the time of so sending, he shall forfeit to the company twenty pounds for every such offence; and it shall be lawful for the company to refuse to take any parcel that they may suspect to contain goods of a dangerous nature, or require the same to be opened to ascertain the fact."—8 Vict. c. 20. s. 105.

In the Act regulating the conveyance of military, gunpowder is excepted from the prescribed rate of conveyance for military stores, and left for special agreement between the companies and the Secretary of State for War. We have received a complaint on behalf of the War Office from Captain Gordon, the Principal Superintendent of Stores at Woolwich, that no company will undertake to deliver gunpowder except upon certain days which they have laid down themselves, and that in case of emergency this is most inconvenient.

We consider that a railway company should be bound to carry, if required, "dangerous goods" at a reasonable maximum rate for their conveyance, and subject to such regulations for safety as may be defined by their byelaws.

141. In considering the improvement of goods traffic, it is very difficult to institute any comparison with the past, because the introduction of the railway system has entirely altered all the conditions of that traffic, and has enabled industry and trade to spring up which, without railways, could have had no existence. Present and former rates for goods.

From the evidence which we have received, we will, however, cite some of the charges formerly made, and compare them with present rates.

Bristol to London. Rates per Ton.

Articles.	Rates charged by Carriers.			Rates charged by Railway.
	1820.	1830.	1840.	1866.

From Manchester to London bales and grain were carried by quick vans in 1833 at 20*l.* a ton; in 1834, by canal, at 4*l.* a ton; in 1840, by railway, before the railway companies were carriers, at 3*l.* 4*s.* 8*d.* a ton; and in 1866 at 1*l.* 15*s.* per ton. On the other

hand, grain carried between South Staffordshire and Liverpool in 1831 cost, by canal, 13*s.* 4*d.* per ton, and is charged in 1866 from 10*s.* to 12*s.* 6*d.*

General principles affecting goods rates.

142. The rates authorized by Act of Parliament afford no necessary indication of the charges actually made by railway companies in this country, because each company largely exercises its power of charging such a rate within its maximum as it thinks fit; and therefore any general average would even much less represent the real facts of the case than a general average for passenger fares.

The extension of railways and the duplicate routes afforded have induced railway managers to look in every direction for traffic, and have led to the development of many classes of traffic.

For instance, until the opening of the Great Northern railway the conveyance of coal to London by railway had no material importance. At the present time it amounts to nearly 3,000,000 tons a year.

The charge for this traffic depends upon its distance from the market. Thus the more distant coal is carried at a cheaper rate per mile than the less distant, to enable both to compete in the London market on equal terms with sea-borne coal; and a large portion of the traffic is carried at $\frac{3}{8}d.$ per ton per mile, inclusive of trucks, from the colliery siding to the coal depôt of the railway company in London.

The same rule as to rates of charge seems to be followed by the railway companies in all important descriptions of traffic, and an examination of the evidence shows that when a large amount of traffic is to be got, a low rate is charged. Thus in the charge for ale from Burton a low mileage rate is charged for distant markets, and a higher rate is charged for nearer markets; otherwise the price would not allow of its sale in distant markets.

In 1842 the receipts from passengers formed 74 per cent. and the receipts from goods 26 per cent. of the total receipts on railways; in 1862 the receipts from passengers formed 46 per cent. and the receipts from goods 54 per cent. of the total receipts.

It is thus clear that a greater development has taken place in goods traffic than in passenger traffic. The development of traffic has no doubt been greatly facilitated during the last 20 years by the union of small companies into larger systems by amalgamation, by which unity of management on trunk lines has been obtained. Thus formerly the lines from London to Liverpool belonged to three different companies. The carriages and waggons of one company were not allowed to pass on to the lines of the other companies, and, as we have already mentioned, the Board of Trade Report for 1843 shows the great delays, expense, and inconvenience experienced by the public and the railway companies from that arrangement.

The institution of the Railway Clearing House, by which the interchange of carriages, waggons, and the traffic they contain is regulated, and the receipts apportioned between the companies according to definite rules and agreements, would have mitigated these inconveniences; but the independent companies forming portions of a main trunk line could never have worked such a line with that identity of interest which is obtained by the union of the lines under one company.

Classification of goods.

143. We have already pointed out that in consequence of Parliament disposing of each special Act as a separate question, the enumeration of goods in the several Acts of Parliament is far from uniform, and that in consequence of the railway Acts having sprung from the old system of legislation for canals and roads, the classification of the goods to which the tolls apply is quite inadequate to the present state of trade and commerce.

The enumeration of the articles is defective; the number of articles mentioned is in no way sufficient to meet the present requirements of trade.

The classification of the enumerated articles is defective; those which are similar in character are not put in the same class in the special Acts of different companies.

When an article has to pass over several railways, on which the classification is not similar, inextricable confusion would result in the apportionment of the total rate of charge for it amongst the several companies, if a uniform classification of articles were not adopted on all connected lines.

The railway companies, therefore, found themselves under the necessity of adopting for their own purposes a classification distinct and separate from that in the Acts of Parliament, taking care, however, that the rate for each class should in no case exceed the parliamentary maximum allowed upon any article in that class.

This classification was drawn up by the Railway Clearing House, and is reprinted in Appendix CP. It includes between 1300 and 1400 articles, and divides them into seven classes, *i.e.*, a mineral class, a special class, and five ordinary classes.

When a railway company is desirous of making a special rate for some particular article included in one of the five classes, it makes an agreement with the other companies over whose line the article is to pass, and then notifies to the Clearing House that the article is placed in the special class so far as those railways are concerned, or moved to a different class from the Clearing House classification.

A revision of the classification takes place periodically, so as to bring it up to the requirements of the day.

We are of opinion that the Clearing House classification should be made the basis of the classification adopted in Acts of Parliament. The enumeration and classification should be stated at length in a general Act. It would then only be necessary in the special Acts of the railway companies to refer to the general Act, and to enact the maximum tolls or charges applicable to each class, instead of imperfectly enumerating articles in each class, as is now done.

If, however, the circumstances of any particular railway, or of the district in which such railway is situated, should render it expedient that the rate on any enumerated article should be different from that necessary for the other enumerated articles in the same class as prescribed in the general Act, it should be mentioned in the advertisement required by the standing orders before introducing the Bill. It would then rest with Parliament to decide whether it would allow a departure from the general Act.

Existing railway companies in whose Acts of Parliament the classification is essentially different from the Clearing House classification should apply for short Acts of Parliament to arrange their existing maximum tolls as nearly as possible to meet the new classification. It would still be competent for companies to vary their charges within the limits of the maximum prescribed by the special Acts.

Amendment of Carriers Act.

144. Several witnesses have complained that the enumeration of goods in the Carriers Act, viz., "gold or silver coin of this realm or of any foreign state, or any gold or silver "in a manufactured or unmanufactured state, or any precious stones, jewellery, watches, "clocks, or timepieces of any description, trinkets, bills, notes of the Governor and Com- "pany of the Banks of England, Scotland, and Ireland respectively, or of any other bank "in Great Britain or Ireland, orders, notes, or securities for payment of money, English "or foreign stamps, maps, writings, title-deeds, paintings, engravings, pictures, gold or "silver plate or plated articles, glass, china, silks in a manufactured or unmanufactured "state, and whether wrought up or not wrought up with other materials, furs, or lace," is unsuitable and not based on any recognized principles of traffic, and they suggest that it should be adapted to the present condition of industry and trade. We think there is great force in this suggestion, and are of opinion that **the enumeration of articles in the Carriers Act requires revision.**

Terminal charges.

145. In considering the goods rates it is necessary to bear in mind the terminal charge. We have already explained to what extent Parliament has recognized the right of railway companies to make some charge beyond the mere rate for moving the goods along their lines, but that it is not easy to define the intention of Parliament in allowing a reasonable sum for loading and unloading and terminal expenses. We have also shown that the attempts made to arrive at a solution of the question in 1861 and in 1865-6 were unsuccessful, and as there is great diversity in the wording of the clauses relating to terminals in the special Acts, it is extremely desirable that some general rule should be laid down by Parliament. We will now therefore point out the distinctions which exist in the nature of the services which a railway company is called upon to perform beyond the mere transit of goods along its lines.

Perhaps the best way of looking at terminals is to assume the simplest case of a trader who possesses a branch railway into his works, which communicates with the railway at one of its ordinary stations, and who, having obtained a waggon from the railway company and loaded it, places it at the junction of his branch line with the main line, and presents it for transmission by the railway company to his correspondent, who receives it from the company in like manner. Such a service would not be entitled to terminal expenses.

Again, if one company having access to the line of another company at its station, delivers trucks already laden to be conveyed over the other company's line, and then to be handed over to a third company, no terminal service is rendered by the company over whose lines the trucks are thus conveyed.

The convenient arrangement of the trucks into a train by the railway company itself after their reception at a station would appear to be a service incidental to the transport, and therefore not warranting a terminal charge.

If the services above described be a correct description of that which it was intended the companies should perform in return for their mileage rate of charge, it follows that services rendered by them in addition should be paid for. Thus, if in the case above described of a trader possessing a branch railway leading from his works to join the railway, the junction were situated at a distance from an ordinary station, and required an engine to be sent specially to bring the waggon, it is not easy to see upon what ground any objection could be made to paying for the extra expense caused, which would relieve the trader from the expense of conveying the goods to the ordinary station for presentation to the company. Or, if the company had to provide conveniences for the carts coming to the station to load or unload the trucks, and some service had to be performed or expense incurred by the companies in addition to the transit of the goods, we see no reason why the trader who requires this additional service should not pay an additional charge; or if for the convenience of the sender or receiver they have to be kept or warehoused at the station, a still further service is performed, which should in like manner be charged for in addition.

Again, when the goods are collected and delivered by the railway company a further charge may reasonably be made for carting.

The railway companies in their dealings with each other were soon compelled to recognize the justice of a terminal charge, which they have reduced to the following system at the Clearing House.

The railway company which accepts the traffic which is to pass over more than one line of railway specifies to the consignor the gross sum to be paid for it. From this gross sum a deduction at a fixed rate for terminal expenses at each end, of 4*s.* per ton for the country and 8*s.* 6*d.* for London, is credited to the companies who receive and deliver the traffic, and the remainder is apportioned between the several companies, as a rule according to the relative lengths of those portions of their lines over which the traffic passed; but any company is entitled to insist upon the transit rate for its own line being fixed at any rate it chooses within the limits authorized by its special Act. However clear these arrangements are as regards the companies themselves, they are not disclosed in the charges made by the companies to the public. A complaint is consequently made that where rates are not kept down by competition, railway companies are enabled to use the terminal charge as a means of levying on traders more than the maximum rates. This, it is alleged, the companies can do because they are entitled by their Acts of Parliament to charge not only a defined rate per mile for carrying the goods, but a further undefined *reasonable* sum for additional services.

This opportunity of abuse would be obviated if the terminal charges were easily ascertainable by being more accurately defined, and separated from the charge for mileage.

However just or convenient it may be for railway companies in dividing the charge made to the public for conveyance amongst themselves, to allow an average terminal charge on the multitude of the transactions they perform of 8*s.* 6*d.* in London and 4*s.* elsewhere, we think it would be neither just nor convenient that each railway company should be allowed to impose these charges in the separate transactions of every individual trader. Each trader should be entitled to have a rate fixed according to the service to be rendered to him, without reference to services which may be rendered to others of an entirely different nature. In prescribing an equitable scale of maximum rates it would not only be necessary to adapt it to the several conditions before noticed, but to take into consideration the various classes of goods and the expenses and risk incidental to the receipt and delivery of each class.

The terminal charged by railway companies amongst each other in the metropolis is a case in point. The change which is going on in metropolitan railway communications will probably bring goods by railway near to every man's door, and will obviously render it necessary for railway companies to reconsider the Clearing House terminal rate of 8*s.* 6*d.* amongst themselves. For these various reasons we are of opinion that it would be unadvisable to give parliamentary sanction to the Clearing House terminal rates.

Again, in many of the leading entrepôts of commerce, the real terminus of the railway is to be found in the docks or other arrangements of the port. This requires a very different terminal rate from that where no such conveniences exist. The scale, to be either just or practical, would involve a great variety of maximum charges, or it would afford no real protection to the varied transactions of individual traders.

The only alternative which suggests itself as worthy of consideration is that embraced in the Act, 27 & 28 Vict. c. 308., of the North Staffordshire Railway Company, which we have set out in the previous part of our report, by which the company voluntarily agreed to such terminal rates as might in cases of dispute be fixed by arbitration. We think there is great difficulty in compulsorily withdrawing all the railway companies, against their will, from the established legal tribunals of the country, and subjecting them to the decision of an arbitrator in this respect.

We therefore recommend that terminal charges should be defined to be charges for all services rendered by the railway company beyond conveyance from station to station, and that they should be based upon the expenses incurred in the receipt and delivery of the goods on and from the line. Also that railway companies should be required to notify publicly at each station the charge they make for all such terminal services, and that at the request of a freighter they should be required to separate these charges from the mileage rate in their account with him.

Waggons.

146. The development of the mineral traffic of the country has been extremely rapid. On some of the older railways the owners of collieries continue to run over the lines with their own engines and carriages for short distances. This is, however, a very exceptional arrangement; but it is a common case on many lines for traders to provide their own waggons, the railway companies finding the engine power and treating them as their own waggons, and in such cases a deduction from the rate of about $\frac{1}{8}d.$ per ton per mile is made.

The conditions under which waggons belonging to traders are allowed to be used on railways has been a matter of complaint. It is alleged that great detention of these waggons occurs on railways; and that whilst railway companies enforce with great strictness claims for demurrage when their own waggons are detained by traders, they allow no compensation to traders when long detentions have occurred of traders' waggons.

The railway companies on the other hand urge that traders frequently use these waggons as warehouses in which to store, upon the railway sidings, the articles they are sending; and that the delays occur more frequently upon the consignee's premises than upon the railway.

The traders also allege that their waggons are very little cared for, and often return in a very neglected condition; but the railway companies allege that the waggons are often of inferior quality and ill adapted to the service they have to perform. Difficulties are also alleged to occur in the case of a break-down, or when repairs are wanted. The traders complain that the railway companies in such cases put the waggons into a siding and leave them there without giving the traders notice of the injury; and the railway companies allege that the traders make difficulties about paying for repairs.

It is quite clear that the use of private waggons, each of which must be returned empty to its owner, causes much extra trouble and expense in arranging the trains and returning the empty waggons, and that if all the waggons belonged to the railway a considerable diminution in the number of waggons now necessarily in use on the railways could be effected; indeed it is alleged that one-third of the whole number might be saved; but on the other hand, individual traders might suffer from not being able to obtain all the waggons they might require to meet sudden emergencies, or a general briskness of trade.

It is shown that the profit obtained from a waggon fully loaded is very considerable. It is obvious, however, that the system of charging for waggons a rate per mile run, by no means meets the justice of the case, as the cost of a waggon is estimated by time and not by distance. Thus companies have been formed for the purpose of letting out waggons and carriages at a yearly rate, and the railway companies make a daily charge for the demurrage to be paid on waggons detained off their lines.

It is obvious that a mileage rate is for long distances as much too high as for short distances it is much too low, the time for loading and unloading a waggon bearing no proportion to the distance run.

These considerations have encouraged the practice of large private traders in many cases preferring to own the waggons necessary for their wants, rather than trust to be supplied by the railway company.

We consider it desirable that railway companies should avail themselves of every opportunity for obtaining possession of the railway plant used on their lines. It appears deserving of consideration whether the system of charging a mileage rate for waggons should not be modified, and a system of charging for the waggon by time instead of by distance be adopted in Acts of Parliament.

With reference to the complaints made by traders of the detention of the owners' waggons on the lines (so long as the system should continue) it has been suggested that the owners of private waggons should be admitted to the Clearing House and be subject to the rules of that establishment, by which they would be entitled to obtain demurrage from the companies for the detention of their waggons. Such an arrangement would alter the character of the Clearing House and interfere so seriously with its constitution that we cannot recommend the adoption of this course, but we think that **each railway company should be responsible to the freighters that all private waggons received from them should be treated when on its own line as the waggons of another company entrusted to its charge, and without undue preference; and when forwarded on to the lines of other companies that the freighters' waggons should be treated as its own waggons in regard to such other companies; and the freighters should then be bound equally with the railway companies by the regulations and proceedings of the Clearing House.**

English goods rates.

147. Having thus endeavoured to explain the various questions which affect the goods traffic of the country and influence the rates at which it is carried, we will proceed to consider the actual charges made, and compare them with those made on foreign lines.

But in comparing the mileage rate at which goods are conveyed between different places it is necessary to estimate the terminal charge, otherwise the rate per mile of short distance traffic appears not only high, but singularly unequal in cases apparently similar. Many of the complaints against railway companies appear to have arisen from not sufficiently appreciating those considerations.

The following table will give an example of the maximum rates authorized by the Acts of the several companies named* :—

General Description of Articles.	London and South-western.	Great Eastern.	Great Western.	Great Northern.	London and North-western.	Midland.
	d.	*d.* *d.*	*d.* *d.*	*d.* *d.*	*d.* *d.*	*d.* *d.*
Dung, lime, bricks, coal, pig iron, iron ore.	2	$1\frac{1}{8}$ to $1\frac{1}{2}$	$0\frac{7}{8}$ to 2	$0\frac{3}{4}$ to $1\frac{3}{4}$	$0\frac{7}{8}$ to $1\frac{1}{2}$	1 to 2
Sugar, corn, earthenware, timber, iron castings, sheet and wrought iron, damageable iron.	3	2 to $2\frac{1}{2}$	2 to 3	$1\frac{3}{4}$ to $2\frac{1}{2}$	$1\frac{1}{2}$ to $2\frac{1}{2}$	2 to $2\frac{1}{2}$
Cotton and other wools, drugs, manufactured goods.	3	2 to $2\frac{1}{2}$	$2\frac{1}{2}$ to 4	$2\frac{1}{2}$ to 3	$2\frac{1}{2}$ to 3	3 to 4
Fish, feathers, household furniture, clothing, silk.	5	4*d.*	3 to 4	3 to $3\frac{1}{2}$	3 to $3\frac{1}{2}$	3 to 4

It will be found that in practice the charges are very much lower than these, especially in the case of coal and mineral traffic.

The table in Appendix EG. gives a great number of examples, extracted from the evidence we have received, of actual charges made for the railway carriage of goods of different kinds between various places. It will show the great differences which exist in the charges made, as well as the effect of eliminating the terminal charge adopted by the Clearing House, on which we have already remarked.

* The rates quoted are those given in the principal Acts of the companies; the minor Acts for branches and subordinate lines frequently authorize rates differing materially from them.

The following few instances, selected from the table, will illustrate these differences.

Commodity.	From and to	Gross Charge per Ton per Mile.	Rate per Ton per Mile after deducting Terminal Charges.
		d.	*d.*
Timber and deals	Liverpool to Saddleworth	3·41	2·59
" "	Newport to Wolverhampton	0·52	0·33
Chemicals	Liverpool to Bradford	2·57	1·20
"	Newcastle-on-Tyne to Hull	0·73	—
Sugar	Nottingham to London	3·81	2·62
"	Glasgow to Manchester	0·89	0·46
Grain	Liverpool to Bolton	3·57	2·29
"	Newcastle-on-Tyne to Lincoln	0·54	0·35
Bar iron	Wolverhampton to Birmingham	3·85	1·09
"	Wolverhampton to Swansea	0·65	0·37
Pig iron	Wolverhampton to Birmingham	2·61	1·23
"	Wolverhampton to Swansea	0·65	0·44
Hardware	Sheffield to Wolverhampton	3·45	2·34
"	London to Aberdeen	0·87	0·60
Nails	Wolverhampton to London	2·44	1·22
"	Liverpool to Newport, Mon.	0·89	0·67
Earthenware	Potteries to London	2·40	1·40
"	Newcastle-on-Tyne to London	1·02	0·47
Encaustic tiles	Stoke to Congleton	7·50	2·00
"	Stoke to Hull	1·64	0·99
Machinery	Blackburn to Rochdale	8·33	6·33
"	Liverpool to Hull	1·94	1·40
Lead (sheet and pipe)	Derby to Manton	4·71	4·00
" "	Birmingham to Manton	2·26	1·87
Silk	Derby to Coventry	8·94	6·89
"	Derby to Glasgow	4·36	4·01
Ale	Burton to Tallington	4·29	2 91
"	Burton to Aberdeen	0·85	0·64

The differences in the rates warrant the conclusion that the charges are low when competition exists in the means of conveyance, or when the article has to compete with a similar article brought from another place to the same market.

148. *Rates on French Railways.*—The regulations for the carriage of goods on the French railways will be seen from Appendix CH. French goods rates.

Articles of light merchandize, in the transit of which speed is of importance, are conveyed by trains at the speed of passenger trains (grande vitesse), at certain rates which are given in division A. of that Appendix, but the more important goods traffic is by trains at slow speed (petite vitesse), division B.

For these the goods are divided into five classes, and as the classification is useful to compare with our own, we have reprinted it in Appendix EC.

The charges for these classes are as follows:—

	Per ton per mile.
	d.
1st class	2·47
2nd "	2·16
3rd "	1·55
4th " according to distance, as follows:—	
For 200 kilometers	1·24
For 200 to 300 "	1·08
Above 300 "	0·93
5th class, also according to distance, as follows:—	
For 100 kilometers	1·24
For 100 to 300 "	0·77
Above 300 "	0·62

These rates are independent of the terminal charge, an extra charge being made for loading and unloading and for general station dues as follows, per ton:—

	s.	*d.*
On small consignments	1	2·4
On full truck loads	0	9·6

When certain goods in full truck loads are loaded and unloaded by their owners, they are subject to a terminal charge of only 3·84*d.* per ton.

When goods are carted to or from the stations in Paris, there is an extra charge of 3 to 6 francs per ton, depending on distance and on the nature of the goods.

There are a great many special and exceptional tariffs adopted by the various French railway companies, all of which are fully published; but as a general rule special arrangements for reduced rates do not appear to be allowed without the authority of the Government.

Appendix ED. shows some of the rates charged on French railways compared with rates for similar distances in England; it is formed from the book of rates on French railways for the year 1865.

This table shows that there are very considerable differences between the French and English rates for the same goods carried over corresponding distances; in some cases the former being the higher, in others the latter. Taking, however, the average of the whole, we find the following results:—

——	English Rate per Ton per Mile, Station to Station.	French Rate per Ton per Mile, Station to Station.
	d.	*d.*
For the goods comprised in Class 1 of the French classification (being the more valuable class).	3·37	2·60
For Class 2	1·66	2·29
For Class 3	1·31	1·67
For Class 4	1·07	1·28
For Class 5, one article only	1·06	0·96

So that for the great bulk of goods traffic the English rates are considerably lower than the French.

Belgian goods rates.

149. *Rates on Belgian Railways.*—On the Belgian Government railways there are four classes—

	d.		*d.*
First class	1·70	Third class	0·89
Second class	1·16	Fourth class	0·62

This is in addition to a uniform charge of 1*s.* 1*d.* per ton in all classes; also for loading and unloading 10*d.* per ton; and if collected and delivered about 2*s.* 6*d.* per ton. Coals which are in the fourth class are, it is stated by M. Fassiaux, carried specially for transit and export at ·32*d.* per ton per mile, and occasionally at $\frac{1}{4}d.$ per ton per mile, including waggons.

German goods rates.

150. *Rates on German Railways.*—On the German railways there appear to be many varieties of classification and rates, some at quick speeds (Eilgut) and some at slow speeds; but it will be sufficient to take the general results given in the report of M. Dubosq to the French Government in 1863, according to which there are three classes of goods—

——	First Class.	Second Class.	Third Class.
	d.	*d.*	*d.*
Baden	2·2	1·7	1·4
Bavaria	3·4	2·0	1·1
Austria	3·6	2·6	1·7
Prussia	2·3	1·7	1·2

On these lines special agreements are allowed to be made, provided all persons sending similar quantities for equal distances are treated alike; and under these coal is carried in Westphalia and Silesia at ·46*d.* per ton per mile, including supply of waggons, and in Austria at 1·1*d.* per ton per mile. No raising of rates is permitted until after six weeks' notice.

In Germany the loading and unloading are included in the rate per mile for the first and second classes, and the third class of goods is generally loaded and unloaded by the consignor and consignee.

Expedition.

151. But one of the most important elements of the service rendered by a carrier is the period of time within which the service is performed. No comparison between English and foreign railways would be complete without also comparing the periods within which goods are delivered at their destination.

The delivery of goods in this country generally takes place the day following that on which they are despatched, and frequently goods received by the railway company in the evening are delivered early next morning. On the other hand, we have complaints that goods to be conveyed from 30 to 40 miles have been delayed four or five days in delivery. The companies are bound to deliver goods without unreasonable delay, and the ordinary courts of law are the medium employed for recovering damages for losses by delay.

In France the company is allowed one day to receive the goods, one day to send them, and one day for the delivery (making in all three days), and for distances exceeding 100 miles extra time is allowed. It would appear from the report of the French Commission that the delivery in England is very much more expeditious than in France for the ordinary goods traffic. For the more expeditious or "grande vitesse" delivery, different arrangements are provided and a higher scale charged.

On the German railways the period allowed for the delivery of goods varies from two days to four and five days in cases of distances beyond 180 miles, and the companies are bound to pay a penalty varying with the extent of delay beyond the periods named.

Parliament appears originally to have acted prudently in refraining from attempting to regulate the precise time for the conveyance of goods. What would have been accepted as a reasonable time at the introduction of railways would not necessarily be so now that the system has become further developed.

And **although theoretically the rights of the public in the use of railways cannot be completely assured unless the traffic which is conveyed at defined rates is to be delivered within a definite time, yet we are disposed to consider that on the whole the public will be better served by adhering to the present rule that the delivery is to take place within a reasonable time, leaving the question of what is reasonable to be decided by a court of law. We see the less objection to this as the County Court affords facilities and is largely resorted to for this purpose at the present time.**

General comparison as regards goods traffic.

152. It will thus be seen that the tariff fixed for foreign railways is less than the maximum rates on English railways; on the other hand, where competition exists, the English charges are far below the maximum; but whatever may be the price charged for conveyance, some of the conditions under which the traffic is carried abroad are less advantageous than in this country.

Revision of maximum rates.

153. At the same time we cannot but feel that it is the duty of Parliament that **when a railway company comes forward for additional powers, Parliament should take that opportunity of revising the maximum rates of conveyance as it may appear reasonable.**

It is necessary that Parliament should be assisted in the discharge of this duty by the officers of the Crown; and as we have pointed out that the Board of Trade should have power to inform itself fully on the subject of tolls and rates, we therefore recommend that **it should be the duty of the Board of Trade, in their Reports on Railway Bills, to compare the proposed tolls, fares, and charges with those authorized and levied on lines connected with the proposed lines.**

5.—Certain Conditions affecting Economy of Working.

Economy of working.

154. In order to determine whether more economical arrangements can be made for the working of railways, so as to make any considerable reduction in the costs of conveyance and in the charges to the public on account thereof, it is necessary to advert to the chief sources of expenditure of railway companies, as well as to the amount of work which they obtain out of their rolling stock.

The following shows the proportion which the different items of expenditure in the working of railways bore to each other in 1842 and 1865 on an average of all the railways of the United Kingdom.

	Per-centage Proportion.	
	1842.	1865.
Maintenance of way	17·8	18·31
Locomotive charges	30·	27·48
Repairs of carriages	31·3	8·83
Traffic charges		28·64
Rates and taxes	5·9	3·93
Government duty	10·	2·63
Compensation for injury to passengers	5·	1·94
Ditto goods		0·68
Legal and parliamentary expenses		1·44
Miscellaneous expenditure		6·12
	100·0	100·00

From this it appears that the relative proportion between the main items of working expenses has not materially altered in the last twenty years.

The mere locomotive and traffic charges amount at the present time to 64·95 per cent. of the whole, and the maintenance of way to 18·31 per cent. additional, making a total of 83·26 per cent., and these heads of expenditure must always form the main items of charge under any system of working.

It will thus be seen that any saving which could have a material influence on the cost of conveying traffic, must be looked for in these, the chief items of expenditure.

Unfortunately the several railway companies do not keep their accounts on the same principle, and on close analysis it is found that the headings in one company's accounts do not always include the same items which compose the headings in another company's accounts.

For instance, one material element in calculating the cost per train mile, viz., the mileage run by the trains, is reckoned by one company at the amount run by the trains, as shown on the time table, and all locomotive expenses are thrown upon that.

Another company adds an amount calculated upon a rule of its own for shunting engines and pilot engines, and another company adds some mileage to the train mileage to cover the shunting work done at stations by the engines of the trains.

The maintenance of way averaged 236*l.* per mile of railway on all the railways of the United Kingdom for the year 1865, but it will be found to follow very much the amount of traffic.

Thus, on the London and Blackwall Railway, where the receipts per mile of railway open amounted to 21,000*l.* per mile, the maintenance of way was nearly 1,000*l.* per mile, whilst on the Fleetwood, Preston, and West Riding Junction Railway, where the receipts per mile amounted to about 870*l.* per mile, the maintenance of way cost under 60*l.* per mile. Both of these lines have been in operation for some years.

In considering the item for locomotive expenses it will be interesting to show the variations it has undergone.

The reports of the Board of Trade show the following cost per train mile for 1840:—

	d.
Cost of coke per mile	8·356
Ditto oil	0·360
Ditto wages of Enginemen and Firemen	1·510
Ditto wages of Labourers and Cleaners, &c.	1·910
Ditto Superintendent, Clerks, Office Charges, Firemen	2·040
Ditto repairs	3·549
Ditto sundries	0·936
Total	18·661

Soon after that time an essential improvement took place in the construction of engines by the introduction of the system of working steam expansively, and in 1845 the following appears to have been the cost on the Great Western Railway:—

	Passenger.	Goods.
	d.	*d.*
Cost of repairs per mile	3·03	2·34
„ coke	3·13	5·26
„ enginemen and firemen's wages	1·34	1·16
„ general charges	1·64	1·94
Total	9·14	10·70

At the present time on the Great Western Railway the cost is as follows:—

	d.
Fuel	1·71
Wages of Enginemen and Firemen	1·49
Wages of Cleaners and Cokemen, &c.	·43
Oil, tallow, and sundry stores	·28
Wages and materials for repair and renewal of engines and tenders	3·24
Water, including pumping engines	·18
Salaries of Superintendents	·16
Gas, rates, buildings, and fire charges	·13
Total	7·62
or more accurately, as deduced from the cost and mileage	7·65

This average may be resolved into 6·75*d.* per train mile for passengers, and 8·5*d.* per train mile for goods.

The repairs to engines and carriages, including the rent of waggons which the company hire, amounts to 3·57*d.* per train mile; hence the average cost of a train for all these charges is 11·22*d.* per mile run.

The following table shows the cost of trains on the Great Northern Railway:—

	Engines.	Carriages and Waggons.	Total.
	d.	*d.*	*d.*
The cost of working passenger trains averaging 7 carriages -	5·90	1·47	7·37
" " " 8¼ -	7·63	1·74	9·37
" " " 10½ -	8·54	2·21	10·75
" goods " 25 -	8·99	2·60	11·59
" passenger and goods " 16½ -	8·50	2·26	10·76

The other items of expenditure which form part of the expense of the trains on the Great Western Railway are shown in detail in the following list extracted from Sir Daniel Gooch's evidence:—

	Per Train Mile.
	d.
Maintenance of way - - - - - -	6·35
Locomotive - - - - - - -	7·65
Carriage and waggon repairs - - - - -	3·37
Rent for waggons - - - - - -	·19
Traffic charges - - - - - -	6·91
General charges - - - - - -	2·74
Compensation - - - - - - -	·45
Furniture, &c. - - - - - -	·13
Working joint lines and stations - - - -	·99
Fire insurance - - - - - -	·07
General office expenses - - - - -	·62
Government duty - - - - - -	1·12
Miscellaneous expenses - - - - -	·04
Rates and taxes - - - - - -	1·10
Bad debts - - - - - - -	·06
Stamps for debentures - - - - -	·02
	s. *d.*
	2 7·81

On the Great Northern Railway they are furnished by Mr. Sturrock as follows:—

	Cost derived from an Average of 10 years.		For 1865.
	d.		*d.*
Engines - - - - - - -	8·50	per train mile -	9·577
Carriages - - - - - 1·74	2·26	" " 2·32	2·748
Waggons - - - - - 2·60		" " 3·00	
	10·76		12·325
Maintenance of way - - - - -	5·13	" "	5·880
Coaching, and merchandize, traffic, compensation, duty, &c.	12·09	" "	12·480
Total working expenses - - - -	27·98	" "	30·685

The whole cost of working a train on the Great Western Railway for 1865 amounts to 2*s.* 7·81*d.* per train mile; on the Great Northern Railway to 2*s.* 6·685*d.*; on the South-eastern Railway the expense is 2*s.* 10·72*d.*; and on the Northern of France 2*s.* 7·34*d.*

The examination which we have given to this question leads us to the conclusion that it is not probable that any diminution of the cost of the principal items of charge can be anticipated, but that the only saving which could possibly arise would be in details of expenditure.

The evidence we have received, however, would rather tend to show that an increase may be expected in the items of wages and materials.

Probability of increasing receipts.

155. We have next to consider how far there is a probability that the net traffic receipts can be improved by increasing the receipts per train mile.

We have been unable to obtain accurate information as to the average number of passengers in ordinary trains, but the average receipts per train mile would appear from the Board of Trade returns to be something above 5*s*.

The evidence shows the following as the train receipts on certain railways:—

Sir Daniel Gooch gives the receipts on the Great Western Railway, from 1849 to 1866,

	Passengers.	Goods.
	s. *d.*	*s.* *d.*
In 1849 they were - - -	8 10·07	14 0·82
In 1866 they were - - -	5 2·02	5 6·64

Mr. Allport (16,939) gives the average earnings of passenger trains per mile on the Midland Railway at 3*s*. 11*d*. per mile; and of goods and mineral trains (16,955), at 4*s*. 6*d*., 4*s*. 7*d*., or 5*s*. 0*d*. per mile.

Mr. Bidder (4333) states that he considers the normal earnings per train mile to be about 5*s*. 0*d*.

The following are the average receipts per train mile, from all sources of traffic, on 12 of the most important English railways, as deduced from the Board of Trade returns for the year 1865:—

	s. *d.*		*s.* *d.*
Great Eastern - - -	5 4·07	Midland - - - -	4 9·68
Great Northern - - -	4 10·25	North-eastern - - -	4 3·12
Great Western - - -	5 5·05	South-eastern - - -	5 10·36
Lancashire and Yorkshire - -	5 9·39		
London and North-western - -	6 0·80	Average of England - - -	5 3·23
London and South-western - -	5 2·14	„ Scotland - - -	4 6·48
London, Brighton and South Coast -	5 1·71	„ Ireland - - -	4 7·80
London, Chatham and Dover -	4 10·65		
Manchester, Sheffield, and Lincolnshire	5 6·83	Average of the United Kingdom -	5 1·74

Mr. Stewart, late secretary of the London and North-western Railway Company, showed that a large cost is incurred by running more carriages in a passenger train than are required for the actual number of passengers. He illustrated this by the fact, that on two days selected as a fair average, whilst 4,482 passengers were booked from Euston Square, the trains to accommodate them contained 13,512 seats. He explained that the large excess of seats arose from the desire to send through carriages on to so many branch lines. To show the extent to which this affects the accommodation, 15 up trains were selected, and in them it appeared that to provide for through carriages for 179 persons, carriages containing 1,274 seats were put on. Mr. Stewart also stated that the average weight of goods put in a goods truck capable of containing five tons does not exceed $1\frac{3}{4}$ tons. This chiefly arises from the desire to send goods to their destination without change of trucks, because of the cost of transferring goods from one truck to another at junctions, and the liability from such transfer of the goods going to wrong stations.

Mr. Bidder explained that great economy may yet be obtained in the transport of minerals over long distances by means of railways laid out under conditions admitting of very long trains being run. This was further illustrated by Mr. Sturrock, who stated that a large gain results from conveying the coal traffic in full train loads with engines capable of drawing heavy loads constructed on the principle of placing a cylinder on the tender, so as to utilize its weight for traction. The cost of traction is increased, but the receipts increase in a greater ratio. Thus,

With the ordinary engine:—
Receipts—210 tons at $\frac{3}{8}$*d*. per ton per mile =6*s*. $6\frac{1}{2}$*d*. per double mile.
Expenses—210 tons at 20*d*. per double mile run, or 25 per cent. of receipts.

With the new engine:—
Receipts—320 tons at $\frac{3}{8}$*d*. per ton per mile =10*s*. per double mile.
Expenses—320 tons at 23*d*. per double mile run, or 19 per cent. of receipts.

These suggestions and others of a similar character, on which we deem it inexpedient to express any opinion, afford evidence of the constant efforts made by railway companies to economize the cost of working.

Excursion trains are always well filled, and on that account should be remunerative; but the evidence shows that their profitable character is to some extent questionable. There is a great deal of empty running, to collect the carriages and take them to the places whence the trains are to start; to take them back, and sometimes bring them again to take back the excursion passengers. Moreover it is alleged that they seriously interfere with the ordinary profits of the line. Trains for the conveyance of minerals, however, when the waggons are arranged to run to and fro, are not subject to the particular sources of expense to which excursion trains are liable.

It has already been shown that no general reduction in the cost of working can be expected.

Hence the only way in which an increased receipt in proportion to the cost of running the trains can be anticipated, is in carrying a larger number of passengers in proportion to the number of passenger carriages in the trains, and running the goods trucks full instead of partially full; or, in other words, obtaining a greater amount of work out of the engines and carriages than at present. But this means that the passenger trains would be less frequent and more crowded; that the passengers going on to branch lines would have to change carriages more frequently; and that goods would have to be detained until full truck loads were made up, which would result in a slower delivery of goods.

Duplicate trains on competing lines.

156. In connexion with this question it is to be observed that there are many duplicate trains run by competing lines at the present time which, by agreement between the companies, might be avoided. Thus the Great Western and the London and North-western Railway companies run trains to Birmingham which start nearly at the same time. The South-eastern and the London, Chatham, and Dover Railway companies run trains between London and Dover which start together and arrive at the same time. So do the North-western and the Great Northern, between London and Manchester. In many of these cases one train would suffice to carry all the passengers.

It must, however, be borne in mind that in each of these cases, and probably in every case of competing lines, the second line between the places supplies accommodation to an intermediate district which would be unprovided with accommodation without it; and that if the through traffic is to be accommodated by means of fewer trains it would be necessary that the return tickets of one line should be available by the other line; that is to say, that the receipts must be divided. There is no doubt that this is the tendency of the railway management at the present time. It is quite certain that competition has produced economy of railway management, and that it has led to the rapid improvements in engines and permanent way which have taken place; and however desirable greater economy in the administration of railways may be, the present system depends so entirely upon the feelings and wishes of society, and on the desire of the railway companies to comply with those wishes, that we do not think that any advantage would result from the interference of authority in this matter.

But one means by which any undue extravagance of railway companies or defects in the administration may be made apparent to the shareholders and the public, and thus stimulate economy, would be by a judicious comparison of the receipts and expenditure on one line with the receipts and expenditure upon other lines. Such a comparison can only be obtained by the several railway companies rendering their accounts to the Board of Trade on a uniform plan.

Recommendation.

157. We do not, therefore, consider that any direct legislative enactments would cause greater economy in the working of railways; but we are of opinion that with the object of affording a more accurate view of the operations of the railway companies, and of making any undue extravagance apparent, and thus stimulating economy, it is desirable that the several railway companies should render their accounts to the Board of Trade, showing receipts from traffic, and the detailed cost of working the line, upon a uniform plan; and that after consultation with the railway companies the Board of Trade should not only prescribe the form of such returns and accounts, but lay down the basis on which they are to be computed.

158. There are, however, two questions connected with the cost of working railways which the railway companies have brought forward as grievances and as reasons why they cannot reduce their charges.

Safety.

I. Some of the railway managers have urged as a reason against developing passenger traffic, and especially third-class traffic, by means of lower fares, the fact that the larger the number conveyed the greater are the numbers liable to be injured in case of accident; and that the very heavy compensation which they are called on to pay renders it preferable to carry a limited number at a high rate, rather than a larger number at a low rate. The numerous excursion trains which are run testify that this argument is not always of practical effect.

In the case, however, of the London, Chatham, and Dover railway company, where the Legislature has required the company to run very cheap trains for workmen in the

morning and evening in and out of the metropolis, the liability of the company in respect of passengers by these trains has been limited.

In considering the possibility of obtaining from railway companies further benefits for the lower classes of traffic, it is material to take into account the relative positions of the public and the railway companies in the matter of safety.

In dealing with questions of the safety of the travelling public, Parliament has acted with no less consistency than in its general dealings with the power of levying rates. It has proceeded upon the principle of not attempting to direct the active operations of railway companies, or to give to the Government, either directly or indirectly, any control over the safe or efficient working of the railways.

We have already explained, but may here recapitulate, that railway companies are free to construct and to work their lines in any manner they choose, provided only that the construction is such at the opening as in the opinion of an inspecting officer of the Board of Trade will enable the then anticipated traffic to be worked without danger to the public. When the line has been opened for traffic, Government only possesses a power of making regulations at junctions between lines of two companies, and where the lines interfere with landowner's interests, as for instance at level crossings. But the control over the manner of working the line is left by Parliament entirely in the hands of the railway company. The company in undertaking the duty of carriers become liable under the common law to compensate persons injured, and under Lord Campbell's Act to compensate near relations of persons killed by the negligence either of themselves or their servants.

If an accident occurs attended with fatal consequences a coroner's jury inquires into it in England and Ireland, and if any accident occurs in Scotland the Procurator Fiscal inquires into it, and the directors or officers of the company are held responsible and would be liable to criminal prosecution and punishment in the event of culpable mismanagement being proved.

It has been urged before Parliamentary Committees that a Government department should periodically inspect the condition of the railways, and have power to require special modes of working or special appliances for safety to be adopted.

An examination of the summary of accidents to passengers which occurred on railways during the year 1865 shows that 36 persons were killed and 1039 injured during the year. Of these 13 were killed and 5 injured, owing to their own misconduct or want of caution, and 23 were killed and 1034 injured from accidents to trains or causes beyond the control of the passengers. An examination of the reports of the inspecting officers of the Board of Trade shows that all accidents to trains are due to one or other of the following causes, viz.: to defects, or at any rate, absence of precaution, in the construction of the permanent way, in the signals, or in the rolling stock; or else to want of adequate regulations, non-enforcement of regulations by the company, or to neglect of regulations by the subordinates of the company.

If to the Government were committed the duty of seeing that the permanent way of the railways was properly maintained, it would be necessary that a large staff of officers should be employed to inspect all the lines with the utmost care and minuteness at very frequent intervals; in short, such inspectors would practically have to perform duties now performed by the companies' engineers, foremen, and plate-layers; such an inspection would require a large establishment unless it were to be a mere superficial and occasional inspection; and just in proportion as the work was efficiently done by Government would the railway companies be relieved from the trouble, expense, and responsibility which they now incur.

Again, witnesses have urged that the Government should receive the power of directing what signals should be adopted on railways, and that they should enforce uniformity of signals on all lines, and further that to the Board of Trade should be committed the duty of deciding upon the long mooted questions as to the form of communication between the guards, engine driver, and passengers.

But it is impossible to form any reliable opinion upon questions as to the relative merits of appliances for safety on railways without a long course of trial on a railway, and a full knowledge of all the circumstances attending their use. A Government department can only acquire such knowledge through the evidence of the railway managers, and thus practically the responsibility of adoption or non-adoption must finally rest upon the managers.

Any attempt to regulate such matters by authority would necessarily tend to check all efforts on the part of railway companies themselves to improve these details of working. We may illustrate these remarks by considering the proposal made last session to enforce

by law a means of communication between the passengers, guard, and driver of a railway train.

Such a law would seem to involve these questions,—

1. What is to be the medium of communication?
2. What is to be the responsibility of the passenger using it?
3. What is to be the effect of the communication?
4. What is to be the duty of the guard on receiving it?
5. What is to be the responsibility of the company?

There are various means of communication which could be adopted, but all are more or less liable to derangement, and the officers of the companies allege that they are not satisfied that an adequate medium has been discovered.

The passengers' liability was defined in the Bill of last session as follows:—

"Any person or persons, being passengers in a railway carriage provided with such means of communication with the guards and drivers of locomotive engines as aforesaid who shall wantonly or mischievously use or set in motion the means of communication with the said guards so to be provided as aforesaid, shall for each offence be liable, on summary conviction as aforesaid, to a penalty not exceeding *five* pounds, and in default of such penalty being paid, to *seven* days imprisonment."

This definition leaves the passenger a latitude which would render it difficult to convict him of abusing his right to use the medium of communication.

The Bill was silent upon the important point as to what was to be the effect of the communication, *i.e.*, whether the signal from the passenger was to be an imperative order to stop the train, or whether the signal was only to call the attention of the guard to the fact that something was wrong. But upon lines worked on the system generally in use on railways, viz., by interposing a limit of time between trains following each other, greater danger might arise from the stoppage of a train between stations regardless of the position of other trains, than from the passenger not possessing the power to stop the train; and in the case of an accident so occurring a question might arise as to how far the company would be liable for the consequences of an act of a passenger interfering with the business of the company under the authority of an Act of Parliament. But it could scarcely be contended that the passenger was to be held responsible. It would thus follow that probably Parliament would have to supplement the interference on this matter by a further interference as to the regulations to be observed between trains following each other, and that each degree of interference in detail would have to be followed by further detailed regulations.

A majority of the accidents are found to be due to combined causes, and much more to a lax enforcement of good regulations, or to a neglect in using appliances for safety which are in existence, than to the absence of regulations or appliances for safety. When accidents occur from an absence of regulations or a want of the necessary appliances for safety, it frequently appears that such absence is due to the circumstances of the traffic having been altered, and to elements of danger having been gradually developed without anything having occurred to bring the altered circumstances to the notice of the manager. Government interference would not necessarily meet this case. It is, moreover, the tendency of Government inspection to seek to multiply accessories to safety; these accessories are more or less valuable, according to the condition of the traffic on a line, and the manner in which it is worked. So long, therefore, as those who control the traffic are free to accept or to reject the Government recommendations, it is very desirable that they should be made. But the more such appliances are multiplied the greater are the chances of danger from their neglect or their failure to act, though the chances of danger are diminished or increased according to the class and character of the men who use them. The selection of the men must always rest with the manager, and he should therefore remain responsible for the selection of the appliances for safety which he places in their hands.

Mr. Cardwell's Committee in 1853 examined very closely into the question. The committee arrived at the conclusion that any interference with the details of management was undesirable, but recommended that there should be placed upon those in whom the management of railways is vested, a greater degree of responsibility than the law then admitted, and proposed that each railway company should have an engineer, a locomotive superintendent, and a traffic manager, who should each be responsible for the proper working of his department. The Committee also proposed to call in the interposition of the Board of Trade to watch over the public safety. They had been appointed at a time when accidents recurred so frequently, and were attended with consequences so serious, that if no change had taken place in that respect severe legislation would have been required. But the marked diminution in the number of

accidents which subsequently occurred induced Parliament to postpone any legislation at that time.

The figures already quoted in this Report show the great improvement which has taken place in the safety of travelling, insomuch that in the year 1865, out of 252,000,000 travellers, 23 only met with death by causes beyond their own control. We believe that no other mode of locomotion ever used by man can show a more satisfactory result, and we are therefore not prepared to suggest any alteration of the present law in this respect.

Parliament has relied for the safe working of railways upon the efficiency of the common law and of Lord Campbell's Act, which give persons injured and near relatives of persons killed a right to compensation. We consider that this course has been more conducive to the protection of the public than if the Board of Trade had been empowered to interfere in the detailed arrangements for working the traffic.

We recommend that to the power which the Board of Trade at present possesses of appointing officers to inspect railways and rolling stock, should be added a power for the inspecting officer to require the attendance of the officers and servants of the company as witnesses, and the production of books and documents bearing on inquiries directed by the Board of Trade, and that the reports of the inspecting officers on accidents should be made public.

Compensation for accidents.

159. The railway companies, however, allege, as an injustice towards them, that the amount of compensation which they are called on to pay in cases of accident depends upon circumstances affecting the condition in life of the travellers, and is not proportionate to the degree of blame which attaches to the company; and that whilst they are compelled by Act of Parliament to carry all persons who offer themselves under similar circumstances at equal fares, they have no power to protect themselves against the chances of heavy compensation to which the dissimilar circumstances of the travellers expose them.

It is also alleged that the present law gives rise to litigation, which adds great expense to the amounts paid by railway companies, and not unfrequently swallows up all the compensation which the railway companies pay to the sufferers.

The inducement to litigation would be diminished if the amount recoverable as compention were limited, and the grievances of which the railway companies complain would be diminished if the compensation recoverable were confined within a maximum amount, which should be fixed with reference to the class of fare which the passenger had paid. It is urged that as part of such arrangement, any person desirous of obtaining larger compensation in case of accident, might have the option of insuring.

On the other hand it must not be forgotten that a limited compensation means that in some cases the sufferer would not receive an equal amount to that which he would receive under the present law, whilst even now it does not always happen that the money payment really compensates the sufferer, for it is not probable that persons would willingly become crippled for life for a money compensation.

The whole amount of compensation, including the heavy fines occasionally paid, when spread over the whole number of travellers, amounts to a very small sum per passenger per mile: indeed, the Board of Trade returns show that the total compensation for personal injury in 1865 was less than 1 per cent. on the gross receipts; but the liability to pay a serious amount of compensation in individual cases is a strong inducement to the railway directors to cause the employés to work the line carefully. On the other hand, it should not be forgotten that there is an important distinction between damages for injury inflicted by a mere wrong-doer, and for contingencies resulting from the failure to perform a contract which the person injured voluntarily enters into, knowing that it is attended with a certain risk. We think that in accordance with the principle applicable to the remuneration to carriers the indemnity should bear some proportion to the charges for services rendered.

We, therefore, recommend that, on the one hand, railway companies should be absolutely responsible for all injuries arising in the conveyance of passengers, except those due to their own negligence; and that, on the other hand, the liability of the railway companies be limited within a maximum amount of compensation for each class of fares, but that any passenger should be entitled

to require from the company any additional amount of insurance he may desire on paying for it according to a fixed tariff.

To prevent the frauds which appear to have arisen upon the railway companies under the present law, **we further recommend that claims for compensation should not be admitted unless made within a certain period, and that the railway companies should have the right of medical examination of the claimant.**

Wilful injury and trespass.

160. In connexion with this subject there are two questions which have been brought to our notice as to injuries to trains from anything thrown by persons standing on bridges or on embankments. It is alleged that the Criminal Consolidation Acts, 24 & 25 Vict. c. 97. and 100., made the law much more stringent than it was before they were passed, by making such cases a felony, and thus depriving the magistrate of the power of dealing summarily with them; and that the result is that in many instances, when children are detected, they are not proceeded against. **We recommend that minor cases of attempts to injure trains by persons standing on bridges or embankments should be deemed a misdemeanor, and disposed of summarily by justices of the peace as they were before the alteration of the law effected by the Criminal Consolidation Act.**

The second is that the law as to persons trespassing on railways ought to be much more stringent. By the present law, a person trespassing must have been warned off before he can be taken into custody, as in the case of trespassing on other property. We are not, however, disposed to recommend that any alteration should be made in this respect unless it be general.

Local rating of railway property.

161. II. The other point brought forward by railway companies as creating a heavy burden upon them, and thus acting as a prohibition to reduce their charges is, that the railways, whilst they are not in many cases a source of increase to the rates, are taxed for local purposes to a higher amount than any other kind of property; that the existing mode of ascertaining the assessable value leads practically to the assessment of profits of trade, and stock in trade, and is vexatious, difficult, and uncertain in operation, and creates inequalities which do not usually attach to the assessment of any other kind of property.

The general principle upon which railways should be rated is a clear one, viz., to take the net annual value of the land as improved in the hands of the railway company by the construction of the line, stations, and other works, without reference to their profits as carriers; that is, to take the rent which would be paid by a tenant to whom the line might be leased. When it is attempted to apply this principle in practice, though it appears to be simple, great difficulties arise. One of the difficulties is, that most sorts of rateable property lie exclusively within the parish which makes the rate; for example, houses or farms, or a manufactory or a coal mine, which are the ordinary objects of rating, usually lie within the parish in which the rate is made, and the assessing authority has only to consider what the probable net annual value of such occupation may be; and even if the occupation be of property in several parishes it is not difficult to value the property in each parish separately. But with regard to a railway which passes through a long succession of parishes, the person making the assessment cannot ascertain what amount of traffic passes over the section of the railway within the parish; he must consider what would be the probable letting value of the entire line, and he must then take such proportion of that entire value as falls within the particular parish. There is also a further complication arising from buildings, or stations, being unequally distributed in the parishes in which the railway is situated; thus in some cases there is a station in the parish and in others there is not, which adds to the difficulty of making a fair assessment upon the railway. The authority in each parish or union makes the assessment without reference to the assessment in other parishes or unions. When the railway passes through numerous parishes or unions in succession, each parish or union is entitled to make its own assessment without any reference whatever to the aggregate that would be produced by adding together the rates of the different parishes or unions.

If the rates were made fairly, by adding up the assessments in all the different parishes or unions through which the line passes, the total annual value of the railway for purposes of assessment ought to be obtained; but the authorities do not, for the most part, proceed from any total. They merely form a conjecture as to the probable amount of value which belongs to that part of the railway which is in their parish. This has, no doubt, led to anomalous results.

With respect to the complaint that the assessment is made on profits on trade, the Courts of law have laid down the principle, not that a railway company is to be rated upon its profits in trade, but that in ascertaining the probable letting value of the railway it is necessary to take into consideration the profits it is earning; because if there were two lines of railway precisely similar in all respects, except that one had a large traffic and the other a small traffic, the railway earning the larger traffic would let for a much higher rent than the other.

There would be great objections to making the railways an exception to the general principles upon which parochial assessments are now made; nor does it appear that in the aggregate railway companies are in reality more highly taxed for local purposes by this system of rating than other descriptions of property.

A return of local taxations presented to Parliament in 1865 shows that the annual charge raised by rates upon the occupation of landed property in England is as follows:—

	£
Church rate	241,960
Sewers rate	44,009
City of London sewers rate	17,242
Drainage and embankment	147,145
Lighting	42,194
Improvement Commissioners	332,983
Metropolitan management	1,001,385
Local Boards	352,016
Poor rates, including police	9,812,956
City of London consolidated rates, *i.e.*, police and ward rates	135,471
Borough rates	311,593
	12,438,954

There is no return of the valuation of landed property for local rates for the same period, but the returns for income tax in England under Schedule A. for 1864, show that the income derived from landed property, as described by the Report of the Commissioners for Inland Revenue for 1865, amounts to 113,445,596*l.* From these returns it may therefore be estimated that the local charges in England are about 11 per cent. upon the income derived from landed property, exclusive of the profits of the farmers or other occupants using landed property for industrial purposes. But it is to be observed that under the Act 21 & 22 Vict. c. 98. railways are to be assessed for rates levied under the Public Health Act, and for the local government of towns, in the proportion of one-fourth part only of the net annual value thereof.

On the other hand, the net incomes of the railway companies in England for 1864, after paying all outgoings except rates and taxes and Government duty, was 15,953,895*l.*; the local rates were 527,123*l.*, or $3\frac{1}{3}$ per cent. Thus only a portion of their earnings has been regarded as derived from the occupation of the railway and stations, and the rest has been left untaxed as the profits of their business.

We would suggest that in order to meet inequalities in the local taxation of railways, some means should be devised by which some public authority, such as the Poor Law Board, should make an assessment for rating the whole railway, and then divide the amount according to an equitable principle between the several unions or parishes.

6.—Interchange of Traffic.

Amalgamations.

162. The number of miles of railway open in Great Britain in 1843 was about 2,100, and these were owned by 70 companies. The average length of railway owned by each company was therefore 30 miles.

In 1865 there were in Great Britain 11,451 miles of railway, under the control of 78 companies, by ownership, leasing, or working arrangements.

The average length of line in the management of one company is now about 150 miles.

The longest line open in 1843 controlled by one company was 118 miles in length. At the present time the London and North-western Railway company controls 1,274 miles of railway; the Great Western, 1,256 miles; the Midland, 700 miles; the North-eastern, 1,205 miles.

The length of line under one control in 1843 was scarcely such as to obtain the most economical management; but the principal object of the companies in amalgamating since that period has been to obtain control of the districts from which they draw traffic,

in order to prevent that traffic being carried by other lines. Amalgamation has thus been rather a matter of offensive and defensive policy than a question of economy in working the lines.

Necessity for free interchange of traffic.

163. The competition for traffic may occasionally make it the interest of one company so to run its trains as to disappoint the trains of another company, or prevent the carriages running over both lines; and to refuse such an interchange of goods traffic as would admit of the goods being sent by the shortest route.

In proportion as the railway communication of the country becomes more complete, and the districts of the several railway companies better defined, does the necessity for a free interchange of traffic between the several systems of railways increase. The Select Committee of the House of Commons of 1853 recommended Parliament to discourage amalgamation, to encourage working and traffic arrangements between railway companies for limited periods, to concede running powers only in cases where the public object of free transit from one system to another cannot practically be ensured by other means, and to make it the duty of railway companies to receive and forward traffic without delay and without partiality.

Traffic Act of 1854.

164. We have already noticed at length the provisions of the Traffic Act of 1854, which was the first result of this Committee's labours, of the Act of 1859, passed to provide for the settlement by arbitration of questions in which companies were mutually interested, and of the Act of 1864, to enable companies to obtain further powers for making working and traffic arrangements by complying with the conditions of a general Act of Parliament, instead of requiring a special Act in each case.

With reference to the restrictions provided in these Acts, it is not very clear that any great advantage arises to the public from the present restriction upon the agreements between companies, by the necessity for a certificate from the Board of Trade; nor do we see how two companies can be prevented from entering into such agreements with each other as would be practically binding upon them even if the Board of Trade refused its certificate; but such an agreement would be secret, and might be detrimental to the public interests.

Recommendation.

165. **We are of opinion that a sound principle to act on in the matter of working and traffic agreements between railway companies is to allow any companies to enter into them without reference to any tribunal, upon the sole condition that the particulars should be made public in the locality, and that they should be terminable by either party at the expiration of limited periods. If any such agreement contained anything contrary to the rights of the public, the Court of Common Pleas should have a power of setting it aside at the instance of the Board of Trade.**

Running powers.

166. The case of running powers is different from that of other agreements, because running powers, in their ordinary acceptation, mean that the incoming company is not only to pass over the line, but to use the stations and sidings of the other company, upon payment of a reasonable compensation, and in opposition to the wish of the other company. But it would be manifestly unjust to require a company already established which had only siding and station accommodation sufficient for its own trade, to give up part of it to another company, and no compensation would suffice in such a case.

Whilst, therefore, the use of the lines should be free according to the original intention of Parliament, and a power of making junctions enlarged, **we consider that questions of running powers, that is of empowering one company to use the line of another company without its consent, must be left to the decision of Parliament.**

Permanent amalgamations.

167. Agreements for the amalgamation of railways stand also on a somewhat different footing from that of the ordinary working agreements. It is, no doubt, desirable to afford facilities for the amalgamation of short lines with larger ones, so as to avoid too great a cost and diversity of management; but each shareholder has guaranteed to him his share in the particular project, as defined by law, of which his co-shareholders or directors have no power to deprive him. We have already stated the grounds upon which **we consider that as a question of public policy a permanent amalgamation of the undertakings of railway companies should not take place without affording to Parliament the opportunity which it now possesses of determining the conditions under which such amalgamation should be permitted.**

Amalgamation in Ireland.

168. The condition of Ireland, however, differs materially from that of England in respect of the number of miles of railway open, and the number of companies and length of line owned, leased, or worked by each, as is shown by the following table deduced from the last return in 1865:—

—	No. of Companies.	Miles open.	Average Length of Lines.	Maximum Length of Lines.
England - -	68	9251	136	1274
Ireland - -	17	1838	108	437

It has been complained by some of the witnesses from Ireland that the great number of companies, and the smallness of the lines owned by them, occasion unnecessary expense in the administration of the railways and great inconvenience in the interchange of traffic. On the other hand it has been suggested that many of the lines have been constructed with the express object of promoting the interests of particular ports or towns, and that this object can only be attained by an independent management connected with these local interests. As no distinction has been made in Parliament between England and Ireland in dealing with amalgamations, we can only ascribe the continuance of a state of things asserted to be inconvenient to the prevalence of that feeling, or to a less creditable cause which has been suggested by some of the witnesses from Ireland, viz., the desire of directors to preserve independent administrations for their own advantage.

If all special interests were duly protected in an amalgamation we are of opinion, for the reasons before adverted to, that great benefit would result from the amalgamation of the shorter lines with larger adjacent undertakings.

The principal provision of a measure to effect this object should be that the shareholders at a special extraordinary general meeting should be at liberty to come to a binding resolution upon the subject, and to authorize the directors, or any special committee appointed by them for the purpose, to settle the terms of amalgamation, to be approved by a subsequent meeting of shareholders. With the sanction of the Lord Lieutenant in Council, who should be empowered to hear opposing parties, the arrangement should have the force of law.

We, therefore, recommend that as a special arrangement for Ireland, Parliament should, for a period to be limited, waive its right to consider each amalgamation as a special case, and that a measure should be passed to facilitate amalgamation by obviating, in the way we have pointed out, the difficulties which, it is said, have hitherto obstructed the progress of amalgamation in Ireland.

Tendency to interchange.

169. We have it in evidence that since 1853 there has been a growing tendency among some of the larger railway companies freely to interchange traffic. The Midland railway company gives the same rate for coal to London whether it passes by their line to Hitchin, or by the Great Northern or Great Eastern *viâ* Newark, or by the London and North-western *viâ* Rugby. Under a traffic agreement between the Great Western, the Midland, and the London and North-western railway companies, these companies practically book through to certain stations on each others lines, and collect traffic in each others districts.

Want of correspondence of trains.

170. There are, however, still cases where the public complain of want of adequate accommodation. For instance, as to the meeting of passenger trains on branch lines, or cross routes, with those of the main lines adjacent.

Thus in the case of through express trains running on two principal lines from London to Scotland, such as the London and North-western and the Great Northern, it is very difficult to arrange the trains on the cross lines which connect them to meet the trains on both lines. In cases of complaint it is necessary that the extent of the grievance should be ascertained, because it would not be desirable or right that for the sake of one or two individuals the traffic arrangements of a company should be interfered with.

In the case of Barret *v.* Great Northern and Midland railway companies, in the Court of Common Pleas, the Court laid down that—

"In such an application it is not necessary to show an individual grievance, but it is quite clear that a case must be made out of public inconvenience. . . . Where there are two competing lines, say from A. to B., and one of them having a continuation from B. to C., the company having the continuation might so arrange the departures from B. as seriously to interfere with the other, and perhaps shorter line, and operate to the prejudice and inconvenience of the public, and force the traffic to B. over a greater extent of line, at the sacrifice of cost or time, or both. Such a case would be under the

Act, and the Court would be justified in interfering in it;" and "it would be unreasonable to compel two companies to make arrangements with respect to their passenger traffic, unless it were made out to our satisfaction that the public convenience require it.

It appears therefore that the existing law is sufficient to meet this grievance; but in order that the public right may be duly vindicated **we are of opinion that in cases where a sufficient public grievance can be shown to exist from the want of correspondence of passenger trains, the Board of Trade should take the necessary steps to bring the case before the proper tribunal under the provisions of the Traffic Act.**

171. In Appendix AD. is a complaint against a railway company for not booking goods through on to all stations on its own line. **We consider that it should be imperative on every railway company to book goods to every station on the lines owned or worked by the company.** Through booking.

It has, moreover, been suggested that every company should be entitled to give a through rate for traffic arising on its own line and going on to other lines, and that the traffic should be at once sent on without delay; but that in case of difference as to the amount or apportionment of the rate the case should be settled by arbitration, the company which gave the rate being bound to pay to the other companies concerned the share awarded to them.

With regard to passenger traffic, it would be necessary to keep tickets at each station for the several places, which in many cases might rarely be used, and this would involve great difficulty and trouble in the accounts. We think it would be practically impossible to lay down any rule to define the extent to which such tickets should be issued. Indeed the trouble to which an individual passenger may be put, in taking a new ticket, would in most cases be far less than the trouble and difficulties the railway companies would experience in largely extending the issue of through tickets.

In goods traffic the object of through booking is to save the delay and trouble which arise from invoicing the goods afresh at the junction station. This may involve a divided responsibility for the safe delivery of the goods at their destination, a separate payment of freight, and, as has been stated by some witnesses, a day's delay.

It must, however, be borne in mind that through booking means practically that the receiving company becomes the agent of, and takes a responsibility for, the companies over whose lines the traffic is to pass. It is a responsibility which is practically taken for each other by companies belonging to the Clearing House; and if our recommendation be adopted, that companies should be compelled to take all classes of traffic offered to them, we think that the responsibility is not of so onerous a nature as to exempt them from receiving traffic to be booked through over other lines.

For this purpose **we consider that any company should be entitled to make a through rate over any other company's line, paying to such other company the amount which that company charges the public for the same goods carried from the point of junction at which the goods are delivered on its line to the point of their destination. The receiving company should be responsible for the safe delivery of the goods, and in case of loss should be entitled to claim an adjustment with other companies in accordance with the Clearing House regulations.** Any other system would practically deprive a railway company of the rights it is entitled to exercise with respect to its maximum rates.

Inconvenience has arisen in through booking for transit partly by sea and partly by land. The railway company, under its ordinary receipt for the goods, has been held responsible for the loss of the goods when it has been caused through the ordinary casualties of transport by sea. To guard against this it is, therefore, necessary in all such cases that a special receipt should be given, protecting the carrier as regards the transit by sea against the ordinary sea risks as expressed in bills of lading. It is suggested that this interposes considerable restriction in conducting through traffic between England and Ireland, or other places, when a sea voyage intervenes. As it is desirable to afford every facility for this important branch of railway traffic a general provision might be framed, by which it should be declared that **in cases where through booking includes transport by sea as well as by land the risk, as regards the sea transit, should be subject to the exceptions ordinarily specified in a bill of lading.**

172. One question affecting the interchange of traffic of great national importance remains to be considered. We have already mentioned that Parliament in 1846, having had the The broad gauge.

subject under its full consideration, determined that the broad gauge should be maintained in certain districts. There were then above 700 miles of broad gauge line laid down, and Parliament has since that period sanctioned nearly 750 miles more, the whole length now existing being about 1,456 miles, as is shown in detail in Appendix CZ. The necessities of the traffic of the country have compelled the railway companies owning broad gauge lines to lay down additional narrow gauge lines along 387 miles of their system, and 1,069 miles of exclusively broad gauge line remain, presenting numerous points which form the frontiers of the broad and narrow gauge systems, and at which great difficulty and expense are caused in the interchange of traffic. The break of gauge interposes a positive bar to some classes of traffic; and would present a most serious impediment to the movement of troops and war materiel between the east and west of England in the event of the invasion of the country. Independently of the opinions expressed in the Report of the Gauge Commissioners, which recommended that the broad gauge should be abolished, any question as to the respective merits of the two gauges has been set at rest by the fact of the large extension of the narrow gauge.

It appears from the evidence of the Chairman and Secretary of the Great Western railway that the alteration of gauge would involve not only an alteration of the permanent way, but of a part of the rolling stock, for although the carriages and waggons might to some extent be adapted, the boilers adapted to broad gauge engines are too wide. It is estimated that the cost of the alteration would amount to about 2,000,000*l.* The condition of the Great Western railway company financially does not appear to be such as to induce an expectation that it would be able to grapple with this evil out of its own resources.

We are of opinion that the continued existence of the double gauge is a national evil. We think it worthy of consideration whether it may not be desirable to require the broad guage to be put an end to; and, as the evil has arisen to some extent from the proceedings of Parliament, whether a loan of public money should not be granted for that purpose, on the principle we have suggested for advances to Irish railway companies.

The injury which may result from a Government laying down dogmatic rules for regulating railway enterprises is forcibly illustrated by the fact that, whilst two gauges were encouraged in England, a third, agreeing with neither, was made compulsory in Ireland. By this arrangement the railways in Ireland have been deprived of all the advantages they might have derived from the use of engines and rolling stock from English lines. The carrying power of a railway, as well as the cost of its construction, increases in some proportion to the width of its line, and consequent magnitude of its trucks and engines; and the cost of the Irish railways has by this enlarged gauge been rendered compulsorily more expensive than that of important English railways, although the traffic must necessarily be much less.

PART VI.

Functions of the Board of Trade.

173. The main object of the several recommendations we have made is to afford to the public facilities for exercising the rights which are already recognized by the existing law, rather than to create new rights.

In this we have followed out the course which Parliament has taken on former occasions when it has considered it necessary to legislate upon railways.

In the earlier part of this report we have adverted to certain powers which have been conferred on the Board of Trade under the Act for the regulation of railways, to enforce compliance on the part of railway companies with the special Acts by which they are regulated.

We have also shown that Mr. Cardwell's Committee of 1853 dealt principally with the question of impediments interposed in the way of freedom of traffic, and that the recommendations of that Committee for the solution of this difficult question are embodied in the Act of 1854, called the "Railway and Canal Traffic Act." This Act appears to us to be sufficient for its purpose. It seems to have contemplated the interposition of the executive Government to bring violations of its provisions before the Court of Common Pleas. And inasmuch as many considerations show that this is a public duty not likely to be efficiently discharged by merely private energy, we have

recommended that in cases which appear to require it, it should be made the duty of the Board of Trade to institute public prosecutions to enforce the Act.

In considering this question it is however important to notice the distinction between a suit which may be carried on in a court of justice for the purpose of establishing a general right on behalf of the public in regard to a railway company, and a suit by an individual for a matter which entirely concerns himself or his own interests.

In the latter case we think there is no reason why an individual should not be left to the ordinary courts of justice and the remedies which they afford for the protection of private rights or the redress of injuries.

With regard to the former, viz., a suit for the establishment of a general right, it appears that the Board of Trade has never exercised the power which it clearly possesses under the Acts above mentioned, although the witnesses who have appeared before us have stated cases in which the railway companies have omitted to perform their obligations towards the public. **In order more effectually, therefore, to carry out the recommendations we have made, as well as to secure a proper regard to the interests of the public by railway companies, we think that it would be expedient in all cases where the public interest is affected, that any person should be at liberty to memorialize the Board of Trade; and that the Board, after satisfying itself, by a preliminary examination into the matter, that the complaint is well founded, should take the necessary measures to enforce the public rights by submitting the complaint for the investigation and decision of the proper court of justice.**

PART VII.

174. We will briefly recapitulate the conclusions at which we have arrived on the subjects noticed in the preceding part of our report.*

Purchase of Railways by the State.

(1.) We are of opinion that it is inexpedient at present to subvert the policy which has hitherto been adopted of leaving the construction and management of railways to the free enterprize of the people, under such conditions as Parliament may think fit to impose for the general welfare of the public. Par. 74.

We consider that there is not sufficient reason for excepting Ireland from this general conclusion; but as it has been the established policy to assist railways and other public works in Ireland, we recommend that when Parliament thinks fit to make advances to Irish railway companies, the money should be lent for a fixed period of considerable length, so as to enable the company to develop its resources before it is called on for repayment. We are, however, of opinion that advances should not be made to the Irish railway companies as a condition of reducing their rates and fares; but that as the railway companies have the best opportunities of judging whether rates can be reduced so as to be recuperative within a reasonable time, they should be left to carry out such experiments at their own risk. Par. 80.

Improvement in Private Bill Legislation.

175. (2.) We recommend that Parliament should relieve itself from all interference with the incorporation and the financial affairs of railway companies, leaving such matters to be dealt with under the Joint Stock Companies Act, and should limit its own action to regulating the construction of the line and the relations between the public and joint stock companies so incorporated; requiring such guarantees as may be necessary for the purpose of securing the due performance of the conditions, upon the faith of which the parliamentary powers of the company have been granted. Par. 90.

176. (3.) We recommend that the Companies Clauses Consolidation Act should, as respects the audit of accounts and the power of the shareholders to inspect them, be assimilated to the provisions of the Joint Stock Companies Act. Par. 92.

---

* The references in the margin show the paragraphs in the body of the Report where the several recommendations are explained.

Par. 83. 177. (4.) All Bills, after having passed through the Committee of the House in which they have been first introduced, should be referred back specially to the Board of Trade for further report, and the Board of Trade should in such report specially consider every point in which public interests are involved.

Par. 153. 178. (5.) When a railway company comes forward for additional powers, Parliament should take that opportunity of revising the maximum rates of conveyance, as it may appear reasonable. And it should be the duty of the Board of Trade, in their reports on railway Bills, to compare the proposed tolls, fares, and charges with those authorized and levied on lines connected with the proposed lines.

Par. 95. 179. (6.) When railway companies apply to Parliament for power to amend their Acts, advantage should be taken of the application to require them to consolidate all the clauses of existing Acts which remain permanently applicable to their undertaking; to protect public and private interests, and to guard against errors, the examination of the consolidation bills should be committed to the Board of Trade. In the meantime railway companies should be compelled to keep, at the office of the Registrar of Joint Stock Companies, a complete collection of all the Acts in force, applicable to their undertaking, to be open to public inspection.

Rates and Charges.

Par. 106. 180. (7.) We do not consider that it would be expedient, even if it were practicable, to adopt any legislation which would abolish the freedom railway companies enjoy of charging what sum they deem expedient within their maximum rates when properly defined, limited as that freedom is by the conditions of the Traffic Act; but we are of opinion that railway companies should be required to give a reasonable notice of their intention to raise their rates of charge.

Par. 108. 181. (8.) In order to enable all persons to be in a position to ascertain with ease whether they are treated on an equality with others, it should be compulsory on the railway companies, under adequate penalties, to exhibit at every station, when required, to the persons using the station, a true list of the whole of the fares and rates charged from that station, and to give full information as to special contracts, rebates, drawbacks, and other deductions or advantages. The Board of Trade or other Government department charged with the supervision of railways should further be empowered to require returns of all tolls and charges actually levied by railway companies, with full information as to rebates and deductions, or to appoint officers to examine the books of the companies.

Par. 109. 182. (9.) We are of opinion that railway companies should be required, under adequate penalties, to publish accurate lists of the distances between the stations on their lines.

Passenger Traffic.

Par. 129. 183. (10.) We are unable to see any method of ensuring punctuality in passenger trains by means of legislative enactments, except that proposed by the Committee of the House of Commons in 1858, viz., that punctuality should be guaranteed, and that passengers injured by delay should be enabled to recover summarily a fixed sum; but we have already referred to the objections to this proposal.

Par. 130. We are of opinion that railway companies should be bound, under adequate penalties, to give at least a week's notice of any alterations of time of their regular passenger trains.

Par. 131. 184. (11.) We recommend that railway companies should be required to afford greater facilities for carrying the ordinary third-class traffic, by running at least two trains with third-class carriages attached each way daily; and that in such mixed trains whenever return tickets are issued for first and second class passengers, they should in like manner be issued for third-class passengers. We consider that workmen's trains on the principle of those proposed in the Railway Clauses Bill of the session of 1866 should be run in and out of every large manufacturing town.

Par. 133. 185. (12.) The Act for the regulation of railways prescribes that the military and police shall be conveyed at 2*d.* per mile for officers and 1*d.* per mile for soldiers; but in some cases the fares for ordinary passengers are below these rates. We are therefore of opinion that

in no case should a railway company be entitled to charge more for the military and police than it charges for ordinary first and third class passengers.

186. (13.) The definition of the term "passenger railway" in the Act for the regulation of railways should be altered, and the term defined to mean any railway on which passengers are conveyed. Par. 132.

Conveyance of Mails.

187. (14.) We recommend that a general Act of Parliament be passed to define all those points which have given rise to difficulties between the Postmaster-General and the railway companies; but we do not deem it expedient to enter into the details of the arrangements to be embodied in the Act. The following services in trains, where railway companies fix the time of starting and stopping, are analogous to those rendered to the public, and a tariff for such services should be prescribed by a general Act, viz., 1. Mails in charge of railway companies without Post Office guards; 2. Mails in charge of Post Office guards; 3. Compartments, or one or more carriages. Par. 134.

In cases where the Postmaster-General fixes the time of starting or stopping, or requires an exclusive or limited train, the question of the proper remuneration for the service performed should still be left to arbitration.

Parcel Traffic.

188. (15.) We recommend that a separate tariff should be laid down and published to govern the conveyance, as distinguished from the collection and delivery, of parcels, so as to enable the rates of charge to be kept down by the free action of individuals acting as carriers by railway. Par. 135.

But we consider that the time has arrived when railway companies should combine to devise some rapid and efficient system for the delivery of parcels; and on the companies effecting such an arrangement, we recommend that a general Act should be passed limiting their liability for each parcel to a certain amount, unless a greater value be declared and paid for according to a settled scale at the time of transmission; and that such further provisions should be made as may be found necessary to enable the companies to carry out their arrangements.

Conveyance of Merchandise and Minerals.

189. (16.) We recommend that railway companies should be bound by law to provide means of conveyance for, and to convey all articles tendered to them, subject to such restrictions as the circumstances of the railway may require, which should be defined by byelaws to be approved as provided by the Act for the Regulation of Railways. Par. 139.

190. (17.) We consider that a railway company should be bound to carry, if required, "dangerous goods" at a reasonable maximum rate for their conveyance; and subject to such regulations for safety as may be defined by their byelaws. Par. 140.

191. (18.) We consider that although, theoretically, the rights of the public in the use of railways cannot be completely assured unless the traffic which is conveyed at defined rates is to be delivered within a definite time, on the whole the public will be better served by adhering to the present rule, that the delivery is to take place within a reasonable time, leaving the question of what is reasonable to be decided by a court of law. We see the less objection to this as the County Court affords facilities and is largely resorted to for this purpose at the present time. Par. 151.

192. (19.) We are of opinion that the Clearing House classification should be made the basis of the classification adopted in Acts of Parliament. The enumeration and classification should be stated at length in a general Act. It would then only be necessary in the special Acts of the railway companies to refer to the general Act, and to enact the maximum tolls or charges applicable to each class, instead of imperfectly enumerating articles in each class as is now done. Par. 143.

If, however, the circumstances of any particular railway, or of the district in which such railway is situated, should render it expedient that the rate on any enumerated article should be different from that necessary for the other enumerated articles in the same class as prescribed in the general Act, it should be mentioned in the advertisement

required by the standing orders before introducing the Bill. It would then rest with Parliament to decide whether it would allow a departure from the general Act.

Existing railway companies in whose Acts of Parliament the classification is essentially different from the Clearing House classification should apply for short Acts of Parliament to arrange their existing maximum tolls as nearly as possible to meet the new classification. It would still be competent for companies to vary their charges within the limits of the maximum prescribed by the special Acts.

Par. 144. The enumeration of articles in the Carriers' Act requires revision.

Par. 145. 193. (20.) We recommend that terminal charges should be defined to be charges for all services rendered by the railway company beyond conveyance from station to station, and that they should be based upon the expenses incurred in the receipt and delivery of the goods on and from the line. Also that railway companies should be required to notify publicly at each station the charge they make for all such terminal services, and that, at the request of a freighter, they should be required to separate these charges from the mileage rate in their account with him.

Par. 146. 194. (21.) We consider it desirable that railway companies should avail themselves of every opportunity for obtaining possession of the railway plant used on their lines. It appears deserving of consideration whether the system of charging a mileage rate for waggons should not be modified, and a system of charging for the waggon by time instead of by distance be adopted in Acts of Parliament.

Par. 146. 195. (22.) Each railway company should be responsible to the freighters that all private waggons received from them should be treated, when on its own line, as the waggons of another company entrusted to its charge, and without undue preference; and when forwarded on to the lines of other companies, that the freighters' waggons should be treated as its own waggons in regard to such other companies; and the freighters should then be bound equally with the railway companies by the regulations and proceedings of the Clearing House.

Certain Conditions affecting Economy and Safety of Working.

Par. 157. 196. (23.) We do not consider that any direct legislative enactments would cause greater economy in the working of railways; but we are of opinion that with the object of affording a more accurate view of the operations of the railway companies, and of making any undue extravagance apparent, and thus stimulating economy, it is desirable that the several railway companies should render their accounts to the Board of Trade, showing receipts from traffic and the detailed cost of working the line, upon a uniform plan; and that, after consultation with the railway companies, the Board of Trade should not only prescribe the form of such returns and accounts, but lay down the basis on which they are to be computed.

Par. 158. 197. (24.) Parliament has relied for the safe working of railways upon the efficiency of the common law and of Lord Campbell's Act, which give persons injured and near relatives of persons killed a right to compensation. We consider that this course has been more conducive to the protection of the public than if the Board of Trade had been empowered to interfere in the detailed arrangements for working the traffic.

Par. 159. We recommend that, on the one hand, railway companies should be absolutely responsible for all injuries arising in the conveyance of passengers, except those due to their own negligence; and that, on the other hand, the liability of the railway companies be limited within a maximum amount of compensation for each class of fares; but that any passenger should be entitled to require, from the Company, any additional amount of insurance he may desire on paying for it according to a fixed tariff. We further recommend that claims for compensation should not be admitted unless made within a certain period, and that the railway companies should have the right of medical examination of the claimant.

Par. 158. We recommend that to the power which the Board of Trade at present possesses of appointing officers to inspect railways and rolling stock, should be added a power for the inspecting officer to require the attendance of the officers and servants of the company as witnesses, and the production of books and documents bearing on inquiries directed by the Board of Trade; and that the reports of the inspecting officers on accidents should be made public.

We recommend that minor cases of attempts to injure trains by persons standing on bridges or embankments should be deemed a misdemeanor, and disposed of summarily by justices of the peace, as they were before the alteration of the law effected by the Criminal Consolidation Act. Par. 160.

198. (25.) We would suggest that in order to meet inequalities in the local taxation of railways, some means should be devised by which some public authority, such as the Poor Law Board, should make an assessment for rating the whole railway, and then divide the amount according to an equitable principle between the several unions or parishes. Par. 161.

Interchange of Traffic.

199. (26.) We are of opinion that a sound principle to act on, in the matter of working and traffic agreements between railway companies, is to allow any companies to enter into them without reference to any tribunal, upon the sole condition that the particulars should be made public in the locality, and that they should be terminable by either party at the expiration of limited periods. If any such agreement contained anything contrary to the rights of the public, the Court of Common Pleas should have a power of setting it aside at the instance of the Board of Trade. Par. 165.

200. (27.) We consider that questions of running powers, that is, of empowering one company to use the line of another company without its consent, must be left to the decision of Parliament. Par. 166.

201. (28.) With respect to amalgamation between companies, we consider that as a question of public policy a permanent amalgamation of the undertakings of railway companies should not take place without affording to Parliament the opportunity which it now possesses of determining the conditions under which such amalgamation should be permitted. Par. 167.

We are of opinion that benefit would result to Ireland from the amalgamation of many of the lines, and we recommend that, as a special arrangement for Ireland, Parliament should, for a period to be limited, waive its right to consider each amalgamation as a special case, and that a measure should be passed to facilitate amalgamation, by obviating, in the way we have pointed out, the difficulties which, it is said, have hitherto obstructed the progress of amalgamation in Ireland. Par. 168.

202. (29.) We are of opinion that in cases where a sufficient public grievance can be shown to exist from the want of correspondence of passenger trains, the Board of Trade should take the necessary steps to bring the case before the proper tribunal, under the provisions of the Traffic Act. Par. 170.

203. (30.) We consider that it should be imperative on every railway company to book goods to every station on the lines owned or worked by the company. Par. 171.

We consider that any company should be entitled to make a through rate over any other company's line, paying to such other company the amount which that company charges the public for the same goods carried from the point of junction at which the goods are delivered on its line to the point of their destination. The receiving company should be responsible for the safe delivery of the goods, and in case of loss should be entitled to claim an adjustment with other companies in accordance with the Clearing House regulations.

In cases where through booking includes transport by sea as well as by land, the risk as regards the sea transit should be subject to the exceptions ordinarily specified in a bill of lading.

204. (31.) We are of opinion that the continued existence of the double gauge is a national evil. We think it worthy of consideration whether it may not be desirable to require the broad gauge to be put an end to; and, as the evil has arisen to some extent from the proceedings of Parliament, whether a loan of public money should not be granted for that purpose, on the principle we have suggested for advances to Irish railway companies. Par. 172.

Enforcement of Obligations of Railway Companies by Board of Trade.

205. (32.) In order more effectually to carry out the recommendations we have made, as well as to secure a proper regard to the interests of the public by railway companies, we Par. 173.

think that it would be expedient, in all cases where the public interest is affected, that any person should be at liberty to memorialize the Board of Trade, and that the Board, after satisfying itself by a preliminary examination into the matter that the complaint is well founded, should take the necessary measures to enforce the public rights, by submitting the complaint for the investigation and decision of the proper court of justice.

All which we humbly submit to Your Majesty's gracious consideration.

7th May 1867.

Report from the Right Hon. W. Monsell, M.P.

May it please Your Majesty,

I venture humbly to dissent from the Report adopted by a majority of the Commissioners so far as it refers to Irish railways.

Although dissatisfaction with the English and Scotch railway system appears to be rapidly growing, no demand for an alteration of its essential features has as yet been made by any large number of Your Majesty's subjects in Great Britain.

The suggestion that "Ireland should be treated in an exceptional manner, and that the "Crown should purchase the Irish railways for the purpose of making them more "beneficial to the people of Ireland than they are likely to become in the hands of "their present owners," was urged by almost every witness from Ireland.

The Commission were informed by Mr. Fox, an eminent Dublin stockbroker, that the Irish railways could be purchased for about nineteen millions of money. It may be necessary to add something to Mr. Fox's estimate, but obviously the purchase of the Irish railways by the State would not involve those financial difficulties to which the report refers in discussing the expediency of the purchase of the railways of the United Kingdom.

It must be remembered also that the recommendations of the Irish Railway Commissioners of 1837–8 were generally approved of in Ireland. So strong was the feeling in favour of a system of central management and governmental control that many of the great landed proprietors were prepared to give their land without compensation if that system were adopted. The measures to carry it out, submitted to Parliament by the late Lord Carlisle, were defeated. The English system was introduced into Ireland, and the evidence given before our Commission contains the history of its failure.

In 1865 there were 1,838 miles of working railway in Ireland, worked by 35 companies.

There seems to be no tendency to amalgamation. Of these railways, two are bankrupt, two at a standstill, six have paid no dividend on some class of their preference stock for the last three years, ten have paid no dividend on their ordinary shares, seven have paid a per-centage of dividend less than the funds, two of this number having paid less than one per cent., six have paid more than the funds but less than commercial interest, and the shares of each of them are below par. Only one—and that a metropolitan railway six miles in length—has been perfectly successful as a commercial transaction; this railway was constructed before the Irish Railway Commissioners made their report. There are only 64¾ miles of Irish railways not subject to the provisions of the Act of 1844.

The practical results of this system, so unsuccessful financially, have been given in detail by the witnesses we have examined.

All seem to agree that the fundamental evil of the Irish system is want of unity of management. All complain of a disinclination to amalgamate on the part of the directors and of the rivalries and jealousies that exist between the various companies. Mr. Meldon, a large landowner in Galway and solicitor to two companies, thus described the management of the Irish railways:—"There are," he said, "56 lines of railways authorized by "Act of Parliament, most of them working. Their average length is about 48 miles "long. Although the Great Southern and Western is 387 miles long and the Midland "Great Western 242 miles long, yet very many of them do not extend 10 miles. Most "of these 56 lines have a separate board of directors, separate engineers, solicitors, and "secretaries, thus there are 430 directors, 56 solicitors, 56 secretaries, and upwards of "70 engineers who absorb a large portion of the receipts of the lines.* It strikes me most "forcibly that a board sitting in Dublin, consisting of three intelligent business-like men, "would be able to do the entire business which the 430 directors do, and do it very "much better. A vast saving of expense would be the result, and harmonic action "would ensure a thorough connexion, when established, which is much required, and "the traffic would be fairly developed." Captain Huish, who was for 18 years manager of the London and North-western Railway, attributes to this divided management four q. 6735.

* Bradshaw's Railway Manual for 1866 gives, for 66 railways, 494 directors, 53 solicitors, 56 secretaries, and 61 engineers, but in several cases the names of the officers are omitted.

facts which he says must strike every one that travels on Irish railways, that the rates are very high, the speed very low, the trains very few, and the remuneration of the proprietors very small.

q. 5530-5562. The late Mr. Dargan estimated the saving that would be effected by the consolidation of all the railways under one management, at one-fifth of the present working expenditure of 750,000*l.* per annum. Mr. Forbes, who was for 10 years traffic manager of the q. 1838. Midland Great Western, thought that about 120,000*l.* per annum might be saved q. 1708-9. by consolidated management. He said, "I would contrast the working of the Irish "lines with that of the London and North-western Railway, which is worked by a single "board of directors, one set of officers, and one establishment. That railway earns an "income of 5,300,000*l.*; it works 1,200 miles, as against 1,700 miles in Ireland and an "income of 1,520,000*l.* The consequence of such a number of separate and inde-"pendent boards of management is that any attempt to develop the traffic in Ireland "up to this time has been a failure." Mr. Forbes, like Mr. Meldon and Mr. Dargan, would place all the railways under one board of management.

Several witnesses have shown in detail the loss inflicted on the country by the general want of co-operation of the companies in their working arrangements and in many cases p. 112, q. 2326. by their mutual hostility. Mr. Tinsly, Mayor of Limerick, stated that in the journey from that city to Dublin there was sometimes a delay of two hours at the junction with the Great Southern and Western Railway, and although the distance between the two p. 120, q. 2656. cities is only 130 miles the fastest train took 5½ hours. Mr. Ryan, a Limerick merchant, showed the inconvenience and delay resulting from the number of small local companies. He stated there were six independent companies in connexion with Limerick, each carrying out its own arrangements without any reference to the arrangements of the other companies, and went into great detail as to the injurious effect of this divided management.

q. 4965. Mr. Fearnley, Secretary to the Newry and Armagh Company, stated that by a continuation of the Ulster and Dublin and Belfast Junction Companies a system has been pursued of diverting traffic from their line, that through rates over the greater portion of it are refused, and that passengers are either obliged to wait for hours at the junction or submit to be carried a long way round.

q. 5057, &c. Mr. Cawkwell, the General Manager of the London and North-western Company, gave evidence of the great difficulty of effecting booking through arrangements with the companies in consequence of adverse interests, and the influence of certain Steam Packets Companies. "They appear to have some control over the Great Southern and "Western Board, either by competition or some other means, by making a joint purse "in which the steam packets as well as the railways were interested. We were compelled "in order to get an arrangement made to sacrifice a portion of our railway's distance. q. 5069. "I am decidedly of opinion," says Mr. Cawkwell, "that the railway traffic of Ireland "has never yet been half developed."

q. 5011. Mr. Delahunty, the managing director of the Waterford and Kilkenny and the Kilkenny Junction Railways, said, "There is a great difficulty in approaching the interior of Ireland "from the want of railway communication, and there is even great difficulty in approaching q. 5016. "Dublin, from the indisposition of the Southern and Western Railways to work in harmony "with the Waterford and Kilkenny, so as to give trains that will conduce to the public "convenience. Although the distance from Waterford to Dublin is only 112 miles, third-"class passengers require two days for the journey." Mr. Delahunty further stated that the whole traffic of the midland districts of Ireland was forced out of direct communication q. 5032. viâ Waterford with the South of England and South Wales. "Direct communication," he said, "at the present moment is stopped altogether. It is so managed that the traffic "must come round by Dublin, which is both tedious and expensive."

q. 5282. Mr. Allport, the manager of the Midland Railway Company, thought "that great "inconvenience arose from the fact of the country being split up into such small "divisions, and that amalgamation would be exceedingly advantageous to the Irish "system."

q. 6535. Mr. Macfarlane, a magistrate of the County Dublin, said the arrangements of the companies in the north of Ireland were very bad. He said, "He reached Omagh (about "130 miles from Dublin) about half-past 3 in the day, and unless he should stop a night "on the way to Dublin he would not reach there before half-past 5 on the following "evening." This witness further stated, that there are actually carriages taking the mails q. 6541. at night, but they carry no passengers; "that it being important for him to go to "Dublin one night, he got on the engine as there was no other mode." "There is "much less accommodation," said Mr. Macfarlane, "between the north of Ireland now "than formerly, when there were coaches both in the daytime and in the night; now q. 6543. "they have only conveyances in the day. The earliest train from the country does not "reach Dublin till about half-past 5 p.m."

This general sketch of the evidence will show in sufficient detail the evils that Ireland suffers from its great number of small independent lines, and the saving that would be effected by their amalgamation under one management.

I will now refer to the evidence in reference to the high charges for passengers and goods.

It appears from the evidence of Mr. Mulvaney, a gentleman who was formerly Commissioner of Public Works in Ireland, and who for many years has been extensively engaged in business in Prussia, that the fares in that country are very moderate. "In "Germany," he said, "you see the labourers travelling by railway, the women coming "in with their large baskets of vegetables and fruit a distance of 10 or 15 miles into "a market town at the cost of three-eighths of a penny per mile; and they make "their marketing before 12 o'clock in the day and go away in crowds." q. 1225.

"The third-class passengers in Ireland are charged the same fare as the rich part of "the people are charged in Germany, who travel in upholstered second-class carriages, "and the anomaly to any one who frequently visits both countries is so striking as to "remove every shadow of doubt as to the impropriety of the rates which exist in "Ireland, and the want of accommodation, especially for the poorer classes."

Mr. Forbes, who was for 10 years manager of the Midland Great Western, said, "In "my opinion the fares and rates in Ireland are prohibitory of any development of the "traffic, and have been so ever since I have known the country. I have had occa- "sion frequently to compare the rates charged in Ireland with those charged on other "railways, and particularly in England, and in the majority of cases the Irish rates are "as high, and in some cases higher, than in England. Practically since the opening of "the railway system in Ireland nothing has been done in the way of experiment. If the "rates were lowered there would be a very large increase in the traffic of the country." q. 1458. q. 1459.

Mr. Forbes recommended that a reduction of 50 per cent. should be made in the charges, and stated that although there would be a loss of dividend for two or three years, it would be ultimately made up, but his directors would not consent. Mr. Forbes referred to the rate charged for coal; on some lines it was as much as $1\frac{1}{2}d.$ per mile, whilst in England it is only $\frac{1}{2}d.$ per mile, and in some cases $\frac{3}{8}d.$ per mile. He endeavoured, he said, to induce his directors to reduce the rates 50 per cent., but they "were frightened" at the suggestion. Mr. Forbes gave it as his opinion that the traffic in coal would have increased tenfold by such a reduction. Mr. Forbes laid great stress on the injury the company sustained in reference to the transport of cattle and agricultural produce. In regard to cattle, he said it was a matter of fact that they carried none of the store stock at all; the fat stock came, of course, because they could not walk by the road; and in regard to agricultural produce he said, "About six weeks ago potatoes were being sold in the "County Galway, within 10 miles of a railway station, at $3d.$ per stone, whilst in Dublin "the price was $7d.$" And Mr. Forbes went on to show how the trade in grain, potatoes, turnips, bacon, poultry, eggs, and other produce would be developed by a low rate of charge. q. 1460. q. 1578. q. 1465. q. 1468. q. 1527. q. 1531. q. 1563. q. 1636.

Mr. Ryan, merchant, of Limerick, said that on account of their high charges the railways in Limerick were not doing the work of the country; "carriers were still numerous "on all the roads where railways are, and we see all the traffic of our own county going "by road by a route running parallel with railways; that the cattle are driven long "distances, having been bought in the west of Limerick and Clare, and going up through "Dublin on to Meath, where they are fattened; this brings them into very bad condition, "and there are no buyers who would not be willing to give a moderate price for their "carriage. As to our passenger trains, most of them are very empty indeed, and if fares "were considerably reduced there would be a very large increase of third-class passengers; "the small farmers and men going to market with their butter, corn, and other farm "produce would use the railways instead of driving their cars along the road." q. 2655. q. 2685. q. 2690. q. 2691.

This witness complained very much of differential and excessive rates charged to the Limerick merchants. q. 2769.

Mr. Cooper, who deals largely in cattle, said, that according to his calculations only one-seventh ($\frac{1}{7}$) of cattle and horses, the same proportion of sheep that travel were conveyed by railway, he thought the charges should be reduced to one-half. Mr. Cooper illustrated the comparative cost of carrying cattle by railway and by the common road, in this way; he said, "I bought 20 cattle in Killarney, and I wished to bring them to a "station between Charleville and Limerick, I inquired the rate, and it came to $4s.$ per "head, I drove them on the road for $1s.$, when I would rather have paid $2s.$ and sent "them by train." This state of affairs was complained of by a number of witnesses. q. 3651–2. q. 3663. q. 3706.

It was mentioned by a witness that Sir Percy Nugent, a director of the Midland q. 7042.

Great Western Railway, stated to him, "that he always drives his cattle along the road, "instead of sending them by railway, and that he bought 65 head of cattle at "Loughrea fair, and sent them home 60 or 70 miles by road instead of rail."

q. 2090–2093. On the Bandon line no cattle are now carried, they are all walked from Bandon to Cork. In the neighbourhood of Dublin, which is of course the great centre of the cattle traffic, being close to the English market, nearly all the cattle are walked to market. The Honourable Mr. Massy, who grazes a large number of cattle, said, "that "he buys a great many cattle in Tipperary and distant fairs, and that he finds that he q. 2129. "can always drive them by road for half that it would cost him to send them by rail."

q. 6737. Mr. Meldon, a Dublin solicitor and large landowner in Galway, showed the effect the high rates have on the transmission of agricultural produce. He said, "I farm about "1,500 acres of my own land in Galway, and I am unable to send any of its produce to "the Dublin markets, owing to the high rates. From Galway I could send a very "large quantity, say from 3,000 to 4,000 tons of farm produce in the year, if we had "moderate rates. I grow potatoes on a very large scale, turnips, mangolds, and carrots. "I grow them as a matter of necessity in preparing the land for laying down, but I "cannot send one of them to the Dublin market. With a moderate rate I could send "the whole to Dublin, and the other farmers in the west of Ireland would soon follow "the example, and take manure back by the return trucks."

q. 6740. Mr. Meldon further said, "The railway companies fix a rate at 14*s.* 6*d.* to my station, "but they make no difference between manure worth 3*s.* 6*d.* per ton in Dublin, and "guano which is worth 12*l.* per ton. The charges are equal for both." I have said, "You bring your trucks up full, but instead of bringing them back empty, do bring "them down filled with manure, and charge a low and moderate rate. I would give "them 5*s.* or 6*s.* a ton, but this is not done. Then in regard to cattle; at Ballinasloe is "held, perhaps, the largest fair in Europe, at the last fair held there I do not suppose "that one-twentieth part of the cattle was brought by rail, the charges are so high."

By referring to the evidence it will be seen that proofs of the evil effects of the present system on Irish cattle traffic might be multiplied indefinitely.

q. 6819. Mr. Perry, a grain merchant, of Dublin, said that he had carefully considered the Irish railway system, its rates and charges. "The rates of freight," he said, "are "unequal, and, in his opinion, much higher than the trade can afford to pay." He referred to Westphalia to show the great success of low freights. He thought "the freightage on "corn should be reduced 'from a half to a third,' the present rate for grain is 1½*d.* per "ton per mile, it ought to be reduced to 1*d.*; since the canal competition ceased (by q. 6831. "arrangement with the railway company), the rates have been advanced nearly 25 per q. 6838. "cent. He thought that after a lapse of two or three years the increase of traffic would q. 6844. "make up for any loss occasioned by reduced rates. At the present time he knew many "mills which were idle, because the rates of freight rendered them not able to work "profitably." Mr. Perry complained very much of the injury he suffered through q. 6859. differential rates. He gave a great number of cases, but the notice of a few will be sufficient; from Dublin to Belfast, the distance 113 miles, the rate per ton is 10*s.*, but to Banbridge, the distance being only 87 miles, the rate is 15*s.* From Dublin to Fermoy, 162 miles, 12*s.* 6*d.*, but to Lisnaskea, which is only 105 miles, the charge is 19*s.* 8*d.* Hence, Mr. Perry concluded that "as the lesser rates are remunerative to the companies, "otherwise they would not carry at them, the higher are exorbitant."

q. 6865. Mr. Parker, a Dublin merchant, said that owing to the unsatisfactory situation of the companies, the directors were unable to venture on any bold experiments, and that a q. 6878. great reduction of fares would bring the masses to travel, a trifling reduction in the railway fares would do nothing, a large reduction would be a political advantage, a social advantage, and a commercial advantage. The reduction of fares for passengers would, he thought, increase to an enormous extent the traffic. In regard to goods, he complained very much of the working of the through rate system, "by which a buyer in Dublin can "have his goods sent cheaper from Liverpool to Cork, or from Liverpool to Limerick, "or to Athlone, or any of the inland towns more than 100 miles distant, than from q. 6890. "Dublin, and the through rates tell to the disadvantage of Dublin, both with regard to "the goods and the passenger traffic." "A Belfast merchant leaves for London on his "business, the distance being rather further, and he obtains a return ticket for 2*l.* 10*s.*, "whilst the Dublin merchant is obliged to pay 5*l.* 3*s.*" "A reduced rate for coal would "have a most important effect in the increase of consumption, as the manufacture "of turf is much more costly than it was when the poor man only got 6*d.* per day for "his labour."

q. 6902. Mr. Bewley gave evidence at considerable length "on the discrepancies between the "through rates *viâ* Dublin and the rates from Dublin." "I hold in my hand," said

Mr. Bewley, "handbills which have been forwarded to me from Castlebar in the West " of Ireland of the carriage of sugar from Liverpool to Castlebar viâ Dublin at the rate " of 20*s.* per ton, but the Dublin merchant is charged for his sugar carried over the " same line 27*s.* 6*d.*" Thus the English merchant sends it in the first instance virtually free to Dublin, and having got it there sends it to Castlebar for 7*s.* 6*d.* per ton less than the Dublin merchant can send it for! Another illustration Mr. Bewley gave: "My firm," he said, "sold to a merchant in Limerick a short time since a large parcel of tea, the " merchant on paying for it deducted 6*d.* per cask, stating that the freight by railway " from Dublin to Limerick was 6*d.* more than from Liverpool viâ Dublin, although " passing over the same line." Mr. Bewley dwelt strongly on the importance in a political, social, and commercial point of view of a general reduction being made in the fares charged for passengers. He believed "that if a very large reduction took place, " within a few years the increase of the traffic would be so great as to bring up the income " to an amount greater than the present. He proposed the third-class passengers should " be charged one-fifth of a penny per mile, second-class four-tenths, and first-class seven- " tenths per mile." q. 6293. q. 6255.

Mr. Bagot, a Dublin merchant, complained very much of the great inequality of charges, and that the through rates are most injurious to their trade in Dublin, "Our direct " import trade or foreign trade," he said, "is sapped and undermined." We are frequently obliged to send our goods to ports in England, and have them stored there and reshipped in order that they may be delivered to the western parts of Ireland cheaper "than we can " have them delivered from Dublin! Our travellers would visit three, four, or five times " more towns in Ireland than they do if the railway charges were moderate. Formerly," he says, "goods were delivered in Bagnalstown from Dublin without classification for 7*s.*, " but latterly, in consequence of an arbitrary classification, they range from 8*s.* 6*d.* to " 18*s.* 6*d.*, as the company refuse to supply classification lists, there are no means of " checking the bills, so that parties are completely at the mercy of railway servants. If " goods happen to be denominated by different names they are charged different prices. " We have greatly to complain of the inequality of rates for carrying small parcels. Some " railways will not take any package under 56 lbs. weight without denominating it a parcel, " so if we get an order for a parcel that weighs, for instance, 40 lbs., we put stones or bricks " at the bottom of the parcel to make up the weight. We would like that there should be " a proper tariff for parcels, commencing, say, at 7 lbs. and going on to 14 lbs. and 28 lbs., " to be charged according to the distance carried; there are one or two railways running " from Dublin to the South and West, and they have a different system and a different plan " altogether. We are not obliged to use so many stones in the case of the Great " Southern and Western as in the Midland Great Western. I should be glad if " the system adopted in the case of the penny postage was carried out, so that they " would carry for a short distance or a long distance, or that it might be divided " into 50 or 100 miles, but we have never been able to accomplish this. We can get no " redress and they will sometimes hardly listen to us." "I have found that the companies " give a preference to particular parties, and I think that is one of the reasons why they " will not publish a tariff of prices. Any person that can make an interest with " them can often have goods carried at a certain rate. What we desire is to have a " published tariff of charges. I look upon it (railway reform) as a most popular move- " ment, and that it would be of immense benefit, even with regard to the feeling of the " people of Ireland towards this country and towards the Government. The article " of fish is a very important one, and we want to be able to carry fish from the seaports " to all parts of the country." q. 6994. q. 6999. q. 7000. q. 7001. q. 7012. q. 7026.

Mr. Pim, the present member for Dublin, recommended that the fares should be reduced to $\frac{1}{4}d.$, $\frac{1}{2}d.$, and $\frac{3}{4}d.$ per mile for the several classes. He calculated the loss would be 330,000*l.* per annum; it would take probably five years before the amount " would be made up. The great complaint we have to make is the disadvantage which " the Dublin traders are under from the arrangements as regards through rates, by which " goods in several cases are carried from Liverpool viâ Dublin to an inland town at lower " rates than are charged from Dublin to the same towns. Sugars, teas, and Manchester " goods are carried from Liverpool to Limerick at lower rates than they are taken from " Dublin to Limerick. At present the labouring classes do not travel by railway as it " is cheaper for them to walk, the charge for carrying horses is also very high, it is " found much cheaper to drive them along the road than send them by rail." q. 7071. q. 7091. q. 7092. q. 7098. q. 7099.

Mr. Macauley, manager of a bank at Coleraine, said, "There was much dissatisfaction " there on account of the way the railways are managed; goods from Portrush to " Coleraine, only 7 miles distant, are charged the same rate as to Derry, 35 miles, and p. 309, q. 7300.

" in consequence all heavy goods are carted to Coleraine, as the merchants will not use " the railways. Coals are brought from Londonderry at 2*s.* per ton, and they charge " the same from Portrush. At Castlerock, which is a sea-bathing place near Coleraine, " and is 28 miles from Londonderry, they give first-class passengers return tickets for " 2*s.* 6*d.*, second-class 1*s.* 6*d.*, and third-class 1*s.* If passengers have to go from " Coleraine to Londonderry they are charged about three times that amount. They " give a great many facilities to the Londonderry people which the Coleraine people " have not."

As to the rates charged for minerals and their effect on the interests of the country:—

q. 1932. Professor Sullivan gave important evidence. He said:—" Low rates would greatly " stimulate the tendency to manufacturing industry in Ireland, which exists at present

q. 1933. " more than at any other time within the last 20 or 30 years. We have a great number " of mines in Ireland, not very rich, scattered through the country, many giving produce " of only a low value, as, for example, sulphur ore, iron ores, and tin ores. The present " rates which are charged on these products are exemplified in the case of the Wicklow " Copper Mining Company. Sulphur ore has been the chief product, and from 80,000 to " 130,000 tons have been annually exported. Iron ore is also found; there is great abun- " dance, and extensively worked. The distance from the Vale of Avoca to Kingstown is " 39½ miles, and the charge for sulphur ore to that point is 4*s.* 3*d.* per ton, being more " than 25 per cent. on the total value of the product, which is 16*s.* per ton free on board.

q. 1935. " The charge on iron ore is exactly 50 per cent. on its value. Independent of the more " valuable ore, small ore, the broken pieces of which they cannot send at all, as the present " charge would amount to 72 per cent. on its actual value. The company had, I am " informed, contracts for this year which would have enabled them to sell 80,000 tons " altogether of ores from that single mine, but they could not fulfil them owing to the

q. 1959. " difficulties with the railway companies. This is not the only loss which the Vale of " Avoca as a mining centre suffers, because we lose the advantage of return freights in " the coal trade.

" There is another district the traffic of which comes on different lines; it is in the centre " of Ireland, in the County Tipperary, where the influence of the cost of carriage is still " more important upon the produce, namely, the district of the zinc mines near Nenagh, " some of the ore is very rich, but a large portion is mingled with ochre, which has to be " removed by an expensive process of washing, and the consequence is it cannot, on account

q. 1951. " of the expense, be removed at all. I have been down in the mines myself, and I know " what the extent of production is, and if there were facility of transit given, say at half the " present rates, the quantity of ore which would be sent would be at least three times

q. 1962. " what it is at present. They cannot send the poorer ores at all because there would be " no margin for profit; they only send the richer. The carriage of the cheap ores has " never really been developed, as the ordinary rates is charged for them as for general

q. 1999. " goods and merchandise.

Mr. Mallet, President of the Royal Irish Society of Engineers, said it was all important

q. 2147. to get coal at a far cheaper rate. " He believed by proper arrangement at three of the Irish " ports, one in the north, one in Dublin, and one at the south for the taking of coal from " steam colliers direct, and giving the steam colliers a back freight in mineral produce, and " with proper arrangements for low freights along the lines of railway, that coal can be sup- " plied over three-fifths of Ireland, and to 2,000,000 of its inhabitants, at a reduction of

q. 2148. " from 3*s.* to 4*s.* per ton on the present price, making it from 10*s.* to 12*s.* per ton. I do not " think it would in any case exceed 14*s.* At depôts established along the lines of railway " proper arrangements could be made by which the coal could slide at once into carts free " from breakage or needless labour in handling, and be taken direct to the consumer.

q. 2154. " I am satisfied that coal can be delivered at a profit upon the Irish railways at a farthing " per ton per mile, provided you get back freight for the train, and a halfpenny per ton

q. 2160. " per mile of the Irish ores, the gradients are particularly good, the country being very flat.

q. 2190. " At this moment on many of the lines of England coals are carried at a halfpenny per " ton per mile, and pay a profit of between 200 and 300 per cent. Drainage and roofing " tiles and coarse pottery and earthenware that would suit the wants of the agricultural " labourers, would be made with advantage. There exists in Ireland numbers of beds of " limestone, of the nature of Portland cement, which might become a manufacture in " Ireland. From the Antrim chalk might be made a cement equal to English Portland " cement, and far superior in point of colour, for it could be made perfectly white. There " are some of the very finest porcelain clays existing in Ireland, from which earthenware " might be made, and to carry on these manufactures it is indispensable to have coal at a " lower price than they have it now.

"Sulphur stone or sulphur ore was exported from Ireland some years ago. It was q. 2191.
"attempted to export sulphur ore from Tipperary, but it had to be given up on the
"ground of the expense of transport. The material was undoubtedly valuable, and there
"was no end to the market that could be obtained for it, but it was not valuable enough to
"pay the inland freight and sea carriage afterwards. If they could get it transmitted at
"the rate of a farthing per ton per mile, it would become a valuable commodity. At this
"moment vast quantities of sulphur stone comes from Guernsey to Newcastle. If it can be
"brought from that district, there is *à fortiori* no reason why it should not pay to bring it
"from Ireland. There is a great deal of ironstone in the Co. Leitrim and elsewhere in q. 2192.
"Ireland. At a place called Arigna in Leitrim there are several beds of ore, which could
"be sent at a profit into England and even Scotland, if they could reach the coast at a very
"moderate rate. In the neighbourhood of Donegal, on the north-west coast of Ireland, is q. 2202.
"to be found sand of remarkable purity for making glass, it is so pure that glass made
"from it there, Dorsetshire sand, or any sand that they are in the habit of using in Eng-
"land, that sand is absolutely isolated from use; if that sand could be brought to Newry,
"or Belfast, or Dublin, and transported across to Lancashire, it would be considered a
"precious commodity in the plate-glass works of St. Helens and elsewhere. Carlow quarries
"might be better developed than they are at this moment. The streets of Dublin are q. 2206.
"being paved with sets obtained from Wales, whereas they might have obtained them in
"Co. Carlow.

"The Killaloe slates are not bad. There are some slates in the Co. Wicklow which q. 2213.
"are very good; but the finest slates in Ireland will be found in Kerry."

Mr. Mallet thought that there ought to be uniform rates established through Ireland q. 2281.
for special classes of merchandise and passengers.

Mr. Bidder, Civil Engineer, thought it most desirable that a low scale should be q. 4379.
established for the carriage of coal; and he thought that if the lines were purchased and
leased out by Government, that $\frac{3}{8}d.$ should be paid per ton per mile.

Mr. Forbes thought that coal could be carried at $\frac{1}{2}d.$ per ton per mile all over q. 1476–1483.
Ireland; he thought coal (if carried at a low rate) would entirely supersede peat.
When he joined the Midland Great Western the charge was $1\frac{1}{4}d.$ per ton per mile; but
he asked the directors to reduce the charge to $\frac{1}{2}d.$ per ton, and got them eventually to q. 1489.
reduce it to $\frac{3}{4}d.$ per mile; but any reduction short of $\frac{1}{2}d.$ per ton would not be sufficient.
On the Midland Great Western line they could take 35 waggons containing 5 tons q. 1518.
each.

Mr. Brady, secretary to the Special Commissioners on Irish Fisheries, said, "That the q. 3190.
"railways had not given those facilities of transit that would induce the fishermen to
"follow their occupation with diligence. The rates of carriage on fish, particularly on
"small parcels tend very much to depress it. Fishermen, unless they get the way of q. 3195.
"sending small parcels of fish, each man sending his parcel to his factor in Dublin, must
"sell it to some hawker or others, who send it away, and the consequence is, that the
"hawker is the man who gets the profit, and the fisherman gets very little for his trouble.
"I think that if the railways afforded greater facilities you would give greater encourage- q. 3200.
"ment to the coast population to fish, for they will take any ordinary employment
"rather than follow that very precarious one of fishing, unless they have good markets
"and facilities. Each fisherman ought to have facilities afforded him, then he would q. 3223.
"get his money direct the next day to himself."

The chairman of the Great Southern and Western Railway, Mr. Haughton, said that
"he would be a very bold man who would make the experiment of reducing fares, and
"that such a proposition had not even been taken into serious consideration by his board
"at any time, that the only change of fares since the opening of his railway was an
"advance of 10 per cent. about nine years ago on first and second-class fares." He thinks
that Ireland is in a poor condition, and does not expect any great increase in passenger
traffic. He added "that many Irish lines are irretrievably ruined, that he does not see
"how they are even to be kept in repair, and that there is only one line in the south of
"Ireland running into his own which has not at the present moment the whole of its
"original capital gone." He believed that the practice of issuing return tickets leads to
great frauds, and he therefore objected to it.

Mr. Murland, the vice-chairman of the Great Southern and Western Company,
chairman of the Dublin and Drogheda line, did not take quite so gloomy a view of the
prospects of traffic increasing in Ireland. He thought that if rates were reduced the
traffic in cattle and in third-class passengers would increase, but that there would be a
temporary loss to the railway companies. While he is opposed to a large reduction of

charges, he thinks that a judicious reduction might be made, both as to goods and passengers, and after a time the loss would be made up by an increase of traffic. He considers that the rate for third-class passengers ought ultimately to get as low as ½*d.* per mile, but would in the first instance reduce it to ¾*d.* per mile. He, as well as Mr. Haughton, believe amalgamation to be desirable, and in his opinion the whole of the Irish railways might be managed with advantage by a single company.

A strong opinion in favour of the purchase of the Irish railways by the Government and their amalgamation has been expressed by Mr. Malcomson, the chairman of the Limerick and Waterford Railways, he said, "the Irish railway represent an expenditure "of 26,395,100*l.*, which, as valued by Mr. Dargan, are now worth 22,000,000*l.* Their "management is so subdivided that there are 66 railway boards, comprising over 400 "directors, while there are several English railways with nearly double the capital of "the whole of Ireland managed by a single board, one of these, the London and "North-western, has a capital of over forty millions, and its working expenses are only "43 per cent. of the receipts, while those of the Irish railways last year averaged 47 per "cent. of the receipts. The amalgamation of the Irish railways would therefore lead "to a great reduction in the working expenses, some of those well informed on the "subject estimate it at 10 per cent. of the receipts, or 170,000*l.* per annum.

"The total receipts in 1865 were 1,737,061*l.* The amount absorbed by working "expenses was 809,914*l.* (which may be considerably reduced), and the net receipts "after payment of working expenses, 927,000*l.*

"If a Government stock was created for 22,000,000*l.* (the amount of Mr. Dargan's "estimate) at 3½ per cent., it would enable the Government to purchase the whole of "the Irish railways, and the annual interest on it, 770,000*l.*, would be less by 157,000*l.* "than the net receipts of 1865. If the saving in working expenses by the amalgamation were only seven per cent., the balance at the disposal of Government would "be about 300,000*l.* per annum, and it might be applied to the two objects, first an "extension of railways into those districts not yet accommodated, and second, the "reduction of rates and fares.

"Single lines of railroad may be constructed in most localities* for 7,000*l.* per mile; "if 100,000*l.* per annum, one-third of the sum which I think would be placed at the "disposal of Government, were devoted to this object, it would enable it to add 400 "miles to the existing railways, even supposing the net receipts from these branches "were *nil.*

"There would remain 200,000*l.* per annum towards the reduction of rates and fares, "and as it is proved that any reduction is followed by an increase of travelling, I think "a diminution of 20 per cent. might be made in Irish railway charges without placing "a deficit at the wrong side of the account."

q. 4015. Mr. Ennis, who at the time he gave his evidence was chairman of the Midland Great Western Railway Company, was of opinion that the traffic of Ireland was a limited quantity, and do as you might in the way of reduction you would not be able to arrive at anything like a compensating receipt in money. It should, however, be here observed that Mr. Ennis subsequently explained that he meant "with reference to any large money q. 4066. "increase, although the traffic might increase, and therefore in that sense it may be said to "be a limited quantity," and in illustration of this position Mr. Ennis said, "We carried "last year 70,000 harvest labourers back and forward to England at ½*d.* per mile, and we "thought we had gone as far in the way of reduction as it was possible to go." Mr. Ennis "did not think it desirable to go below ½*d.* per mile, but if a board of management "were prepared to make a great sacrifice, it is possible that they will arrive at a more "satisfactory result than is now obtained, but the shareholders will not consent to go "without their dividends during that time for a problematic advantage."

Mr. Ennis gave proof of the necessity of lower fares by the statement which he made from his own personal knowledge of the great number that preferred walking to pay ½*d.* per mile. He said, "I have often seen men walking past my gates in clusters of 20 or 30, "and hire one of the cars of the country for eight or ten Irish miles. Ten men being "carried on the car they used to ride in, they would pay 3*s.* or 4*s.* for it."

q. 4052. In regard to cattle traffic, he did not think that any reduction in rates would increase the traffic. If there would be any addition he did not think it would outweigh the disadvantage that would result from a great reduction in rates.

---

* 400 miles at 7,000*l.* per mile=2,800,000*l.* 100,000*l.* per annum at 3½ per cent. represents a capital of 2,860,000*l.*

It is to be noted that there is no difference of opinion among the directors as to the great advantages which both the companies themselves and the public would gain by amalgamation. Mr. Ennis said, "He should like to see a general amalgamation of all "the companies tried. It stands to reason, if you diminish the expenditure for "management, railway staff, and these things, you gain something." Mr. Haughton thought the public suffered great disadvantage from the smaller lines not being amalgamated with the larger ones; and he thought it only a question of time, that there must be an amalgamation of all the railways in the south of Ireland. q. 4100–4101. q. 4591–4588.

Although however the directors thought amalgamation was desirable, they did not throw out any suggestions, still less propose any plan by which it could be carried out.

Great efforts have been made for several years past to negotiate an amalgamation of the principal northern lines, but without success.

The Earl of Lucan, chairman of the Great Northern and Western Railway, had great faith in the ultimate result of a large reduction in fares. He was firmly of opinion that on their own railway, if they could afford to have a smaller dividend for the next four or five years by lowering the fares considerably, not less than 50 per cent., we should pay a larger dividend than at present. All heavy goods should be sent at ½*d.* per ton per mile, but all directors and managers of companies, however they may differ as to what the eventual increase may be, agree as to the fact a great reduction in fares will cause an immediate heavy loss. q. 2942.

Various suggestions have been made to us as to the best means of working a consolidated system.

Lord Clancarty is a director of the Midland Great Western, and was so convinced that cheap fares would not diminish railway profits that he offered to guarantee the company he is connected with against loss if they would try the experiment on a portion of their line, a proposition which they refused to accede to.

He suggested that the Irish railway system should be managed by a Government Railway Board, presided over by a member of the administration.

He thought that such a board would possess greater intelligence than the present boards of directors, and that it would exercise its powers in the direction of a reduction of fares. Professor Hancock, Mr. Galt, and other witnesses have expressed their agreement in principle with Lord Clancarty, though in many details their suggestions differ from his.

The late Mr. Dargan stated in his evidence that the Board of Works might work all the railways, or some board that was specially formed for the purpose, which probably he considers would be a better plan.

On further consideration he proposed, in a letter addressed to us, that the taxation on railway property in Ireland should be reduced, and that Government should advance to the Irish railway companies a sum of, say 6,000,000*l.*, at the rate of 2,000,000*l.* annually for three years at 3½ per cent., to enable them to pay off money at present borrowed from private sources at a higher rate of interest. In consideration of these advantages he said that the railway companies should reduce their rates of charge in respect of third-class passengers, and of the lower and less valuable classes of goods, cattle, &c.

The late Lord Donoghmore, Mr. Hemans, Mr. Hill, and many other witnesses suggested that the amalgamated lines should be leased to one or more companies, under stringent conditions as to low maximum fares and increased accommodation for the public. This proposition was discussed in great detail by Mr. Bidder, C.E. "It is "impossible," he said, "in Ireland, or any country, to get the full benefit of railways "so long as they are cut up into a small number of divisions. You cannot have through "rates, and you cannot have the power of adjusting the rates with that flexibility which "my experience teaches me is necessary in order to give full convenience to the public, "and to secure the largest revenue to the railway. What we ought to aim at in railways "is very much the same as that which was done by the Post Office, that is to have "one rate, if possible, to all places. It has occurred to me, looking at the Board of "Trade returns and the map of Ireland, that there is no practical difficulty in working all "these railways under one management. I am convinced that it is as easy to manage "the whole of this system of railways under one management as it is to manage the "Great Western system, or the Great Northern system, or the Midland system."

"In my opinion, the most efficient management of the railways in Ireland would be "obtained and carried out by what is called in these days a Limited Liability Company, "consisting of some nine or ten individuals, with a capital of a million, with conditions "for affording every possible facility to the public, and subject to low rates for coal, "cattle, and passengers, and possibly for dairy produce and fish: that contract I q. 4219.

" should put out to tender, and I believe there would be no difficulty in obtaining " tenders." He then gave reasons for believing that by proper precautions the lessees might be compelled to keep the lines and rolling stock in good order.

q. 5295. Mr. Allport, on the other hand, manager of the Midland (English) Railway, thought " if they were bound to individuals, they would fall into this difficulty, that the individua. " or company, consisting of half-a-dozen or a dozen individuals leasing a line, would not " have exactly the public interests in view, but their own private interests, to such an " extent that he did not think you would establish that thorough management which our " present system of railway management enforces. At present you have not only the " public to deal with, but you have a large number of shareholders, and anyone who is " practically acquainted with railway management, knows that it does not follow that the " interests of the shareholders are looked to at the expense of the public. There are a " variety of reasons which compel railway companies to be liberal in their dealings with " the public, but he did not see how you could enforce that if you leased the railway to a " few individuals." But it must be observed that Mr. Allport, unlike almost every Irish witness, considers the Irish lines to be tolerably well managed.

q. 5282. Mr. Allport agreed with Mr. Bidder as to the necessity of amalgamation, he says, " I " think amalgamation would be exceedingly advantageous to the Irish railway system, " just as it has been to the English railway system. Mr. Cawkwell, the manager of q. 5069. " the London and North Western line, was decidedly of opinion that the railway traffic " of Ireland has never yet been half developed. He thought there could be no doubt " that great good would result from amalgamation, if it could be carried out. The q. 5071. " Irish boards do not appear to act together at all, you cannot get them to do so, I q. 5148. " believe they are governed by local jealousies, I do not know why it is, but it is not in q. 5151. " Ireland as it is in England, for here the railway companies can always work together q. 5152. " and make their through arrangements, in Ireland they cannot do so. He had no doubt if q. 5174. " the railways were concentrated under one authority, and managed with the same energy " and intelligence which characterized the management of other large systems in q. 75. " England, the shareholders would be much benefited, and the public much better q. 76. " served. But he would prefer to leave the Irish railways to two or three companies " rather than one."

" In all cases Mr. Bidder would restrict the charges generally to what they are at " present in Ireland—nothing should exceed the present existing charges. He should carry " coal at three-eighths of a penny per ton per mile. He would carry passengers by one train " per day at a farthing per mile—for cattle, pigs, &c. he would probably charge the one- " half of the present rate. He had no doubt that you would have an enormous number " of passengers at $\frac{1}{4}d.$, per mile, and that you would make the earning up to the q. 4335. " amount which I consider to be nominal earnings of all railway trains namely, 5*s.* per " mile." There is no doubt there would be a great increase in coals if you charged at the " rate we are bringing in coals into London now. He had a contract last year, as to " having them in at $\frac{1}{4}d.$, per ton per mile, and then it was urged by nearly all the railway " managers that it was absurd, but he believed that they all now agree that it was not " absurd. We are now bringing coals from Peterborough to London, a distance of 100 " miles, for 124 farthings."

q. 4275. Previous to Mr. Bidder's scheme being carried out all the railways would necessarily have been purchased by Government. He did not think that much even of temporary loss would be incurred by a large reduction of the fares and charges. " The economy which " would be introduced by sweeping away so many boards of directors, the greater economy " that would take place in the working from being in one set of hands, the greater " use that would be made of the rolling stock and the stimulus that would be given to " traffic by the lowering of the rates would be attended with great advantages. I " think that a company taking the Irish railways in hand upon the terms I have suggested, " and beginning at once upon those terms, would secure the state from any possible loss."

q. 4277. Mr. Bidder referred to some reductions in charges which he thinks necessary, but he did not propose that these reductions should extend to all charges. He said he would not tie the hands of the companies too tightly, he would leave them to deal with the traffic as they thought fit.

I have now given the opinion of the Irish witnesses as to the principal evils of their existing railway system, and have mentioned some of the suggestions made for its improvement.

The Irish people are so dissatisfied with the present system, and so convinced that the removal of these evils would lead to the development of the resources of Ireland

and to the material improvement of her population, that they have in various public meetings expressed their willingness to have any loss, which a new system at its commencement might entail, borne by Ireland.

It cannot be denied that the existing system is peculiar to Great Britain, and that in various degrees central management and control prevails throughout the continent of Europe.

Neither can it be maintained that in getting rid of this exceptional English system, and in adopting one more in conformity with those of the continent, we should in any degree interfere with the ordinary laws regulating industry.

The anticipations of the Irish Railway Commissioners have been fulfilled. The main avenues throughout the country have ceased to be the property of the State and are handed over to the absolute possession of monopolists placed beyond the reach of rivalry and control. They are enabled to establish a monopoly in the most extensive sense and to keep the intercourse of the country entirely at their command. We have to deal, then, with a monopoly granted upon conditions which may now be brought into play without infringing the principle on which railways were granted by the Legislature, and to very many of the railroad companies who possess this monopoly the words of the House of Lords Committee that "When a company becomes seriously embarrassed it is expedient "that the concern should be transferred to others under whose management it may be "efficiently conducted," apply in their full force.

The legislature adopted a system for Ireland that has resulted in the creation of a number of insolvent monopolies, annihilating other means of transport, but not developing or efficiently conducting the traffic of the country. It is obviously bound to face any difficulties for the purpose of remedying those evils. The task no doubt is difficult, and I proceed to consider the recommendations that have been made for accomplishing it.

It has been suggested that money at a low rate of interest should be advanced to the several railway companies for the payment of their Debentures and other debts upon condition of their reducing rates and fares, but the proportion of debt to paid-up capital in different railways is so unequal that the amount of bonus offered, though in some instances large, would in others be insufficient for the attainment of the object proposed. Neither would this plan attain the essential object of amalgamation.

Several witnesses have proposed that the railways should be acquired by the State by voluntary agreements. This process would be necessarily slow, and would enable companies that held back to extort much more than the real value of their properties.

No effectual means has been suggested for consolidating the Irish system and for the reduction of the present charges except their compulsory purchase by the State, and although the principle of such a compulsory purchase is sanctioned by the Act of 1844, it could not be satisfactorily carried out without a new Act of Parliament.

The shareholders in the railways that pay no dividend, contend that their present position is exceptional and transitory. There appears to be no objection to allowing any company, that so thinks fit, to postpone the valuation of its property to any period within 10 or 14 years from the time the State may take possession of it, and to enable it to receive whatever sum its working under a new system may show it to have been then worth, having due regard to its progressive development.

Upon the manner of managing the consolidated railway system when acquired by the State various opinions, to which I have already referred, were expressed. Several witnesses have recommended that it should be directly administered as the Post Office is by the Government.

It was urged by the advocates for this scheme that a large portion of the Belgian system is so worked. The public there consider the State railways to be better managed than those in the hands of private companies. Although the State manages its railways more with a view to the public good than to profit, the financial results of this management are satisfactory.

There is a profit of 7 per cent. on the capital that was expended.

The fares are very low. From Brussels to Ostend, a distance of 90 miles, the fares by express trains are, 1st class, 4*s*. 7*d*.; 2nd class, 3*s*. 2*d*.; 3rd class, 2*s*. 4*d*. Although the Belgian constitution is free, and there are constant closely contested political conflicts, no complaints have been made to us of railway patronage being used for party purposes. The railway staff is selected by competitive examination.

To use Mr. Hill's words, "We see in countries abroad where we believe there is "certainly not more political honesty than at home, that the Government proprietorship "seems to be very successful in its results, that the fares are low, and that the Govern-"ment is not a loser thereby, and we do not hear of political influences."

If the necessary reforms of the Irish railway system could not be made in any other way, I should be prepared to adopt this suggestion.

There is sufficient force now in public opinion to check the abuses which were formerly rife in public departments, and public opinion would at once be brought to bear with crushing force on any maladministration of a department in whose good working the great mass of the population are deeply and continually interested, but it is no doubt undesirable to extend without absolute necessity the action of Government.

The scheme for railway reform suggested by Mr. Bidder and many other experienced and able witnesses is not liable to this objection, and would, in my opinion, "secure large reductions in the fares of passengers and in the freight of goods, with the "consequent increased facilities for locomotion and for the further development of trade "and agriculture."

This scheme may be described in the words of the late Lord Donoughmore, "The "State should enter into an arrangement with a company to work and manage the "lines upon certain conditions with respect to rates for passengers and goods traffic, and "to reasonable accommodation."

The leases to companies would, as in the case of Post Office packet contracts, be for short periods and would be open to public competition. The tenders would state the lowest maximum rates at which the parties tendering would engage to carry traffic. There would be thus "competition for the field, though not competition in the field." As this competition would be periodically renewed the rates would be reduced to the lowest amount at which they would be remunerative. The railways would not be owned by the lessees. They would not, therefore, in Mr. Bidder's opinion, require a capital of more than one million. Their dividends would be materially affected by an increase of traffic, or a saving in working expenses, too small to be felt when distributed over the twenty-six millions that now form the capital of the Irish railways. The lessees thus would have a much keener interest in the good management of their undertaking than the present proprietors have. Mr. Bidder, and other witnesses, have shown that there would be no difficulty in enforcing conditions to maintain the lines and rolling stock in good order.

The danger of traffic being improperly diverted from its natural channels would be avoided by putting proper conditions into the leases.

Competent witnesses have informed us that State purchase and consolidation would at once produce a saving to the Irish railway system of at least 200,000*l.* per annum, 100,000*l.* by the reduction of the interest of the debt, from 100,000*l.* to 150,000*l.* by consolidated management, and the power of transferring rolling stock to places where it may be required on special occasions, such as Ballinasloe fair. Want of capital by railway companies not only prevents the development of traffic, but hinders them from availing themselves profitably of the existing requirements of trade. The concentration of a large amount of rolling stock is frequently required for transporting cattle from fairs, and purchasers of stock uncertain of being able to remove them, either abstain from buying, or buy at a lower price.

But should there be a temporary loss from a reduction of fares, greater than this saving would meet, the question will have to be decided whether this loss is to be borne by Ireland alone, or by the United Kingdom.

That question it is not within our province to decide. Government and the Legislature must pronounce upon it.

I confine myself, therefore, to expressing my opinion that an Act of Parliament should be introduced for the purchase of the Irish railways, and that the Irish railway system should be consolidated and leased in the manner I have just described.

I consider the Bill that passed the House of Commons last year for the construction of new railways under the authority of local bodies in Ireland, and under the control of the Board of Trade, would, if passed into law, afford every facility that it is desirable for extending the Irish railway system.

The scheme I have recommended would confer no partial benefits, it would affect every class in Ireland. It has been urged that it would raise the landlords' rents, but so would any measure that makes Ireland prosperous. Every class would necessarily share in the results of that prosperity. The labouring classes, debarred by their poverty from the use of railways at high fares, would, perhaps, in a poor country thickly, but unequally populated, be the principal gainers.

Cheap coal is a necessity for manufacturers. Low charges would reduce the price of coal. Peat fuel again has become scarce and dear throughout a great part of Ireland by the rapid exhaustion of the turf bogs and the increased price of labour. Those that remain

are widely separated. A measure giving greater facility to the transit of coals would lower the price of peat fuel and provide a substitute where it cannot now be procured.

It has been suggested that the average distance for which goods could be conveyed in Ireland is short, and that therefore reduction in the rates of carriage would not much affect their price. This is a misapprehension. Indeed, the average length of conveyance of goods is greater than the geographical form of Ireland would lead us to expect, for Irish produce goes in a great part to the Eastern ports, and the effect therefore of cheapening carriage from West to East would be of material advantage to the country.

It has also been said that railways cannot be prosperous in districts where there is not great commercial activity and a wealthy population, and where the transport of goods arising from great manufacturing towns and mineral production does not exist. I will not stop to inquire how far the depressed state of many of the agricultural railways in Great Britain is attributable to the British railway system not being suited to districts so circumstanced. It is sufficient for me to point out that in countries as purely agricultural as Ireland railways managed on the centralized system are as prosperous as the best English railways.

I find that some of the Prussian railways, *e.g.*, the Königliche Ostbahn, and others running through districts with quite as little of manufacturing wealth as the average of Ireland, pay large dividends.

It has been urged that it would be unjust to subsidise railways in order to induce a reduction of rates without doing the same for canals and inland navigation of a proprietary character.

This objection must have been made without due consideration of the fact that of the three Irish canals, one is now in the possession of a railway company and one under Government control, and that both the canals and inland proprietary navigation have received large subsidies for their formation.

In Ireland experience proves that large profits may be accumulated in trade, noble and costly edifices built, great charities instituted and maintained from the shillings of the poor. This must always be the case in a poor and thickly-peopled country, and seems to point out by an inevitable analogy that a measure, which by cheapening fares would bring the railways of Ireland within reach of the population, would ultimately tend as much to the financial improvement of railways, as to the comfort and civilization of the people.

A reference to Sir Rowland Hill's separate report will show that while there are important points of difference between us, especially as to the conditions of purchase, we nevertheless agree in recommending that the Irish railways should be dealt with, and that their purchase by Government should be made with all convenient speed.

It is with pain and diffidence that I have ventured to differ from the majority of the Commissioners. I sincerely respect their opinions, but I humbly submit to Your Majesty that those opinions are not supported by the evidence taken before the Commission, while the conclusions to which I have arrived are founded on that evidence, and are supported by the almost unanimous approval of Your Majesty's Irish subjects.

All which I submit to Your Majesty with great humility.

WILLIAM MONSELL.

7th May 1867.

Report from Sir Rowland Hill, K.C.B., F.R.S.

May it please Your Majesty.

1. Finding that, amongst the recommendations contained in the Report adopted by the majority of the Commissioners, there are several in which, to my regret, I cannot concur, and being further of opinion that measures of a more decided character are required to effect a radical cure of existing evils, I have felt it my duty to present my opinions on such points in a separate Report, which, in a growing expectation of dissent, I drew up (though in a slightly different form) as the evidence proceeded, and eventually submitted to the Commission for its consideration.

(A.)—Beneficial Effects of Railways.

2. When the railway system is viewed as a whole, every one must be struck with the extraordinary results it has already produced. Voluntary combinations of spontaneous origin have by their own enterprise and by the skill and energy of their directors and officers so improved the whole process of travelling, that a return to the state of things existing but 30 years ago would produce utter confusion, interrupting the habitual and necessary traffic, and limiting personal locomotion to a degree absolutely intolerable; the arrival of distant posts would seem to be indefinitely delayed, and thousands of prosperous undertakings, brought into existence by railway facilities, would inevitably and speedily collapse. These facts, notorious as they must be, will appear yet more distinctly when the matter is viewed somewhat in detail.

Of course the most obvious improvement consists in increase of speed, the present rate of motion being about fourfold that of the stage coaches on the old roads.

Increase of convenience is equally noticeable. Roomy carriages, generally lighted, and warmed when needful, have replaced the old stage coach with its cramped interior; while the former outside passengers are supplied with close carriages sheltering them in all weathers, and even those whose best attainable means of travelling were waggons proceeding at the rate of two or three miles an hour, are now conveyed by third-class carriages in tolerable comfort and with great speed. Finally, all of every degree, save, perhaps, in some very exceptional cases, instead of being compelled to take places sometimes two or three days in advance, now enter a station in full confidence of finding seats. The stations themselves, it need not be said, are a remarkable improvement on the old inn yard.

Even safety, notwithstanding the terrible accidents with which the public mind is too often shocked, is, when viewed in relation to the vast amount of traffic, greatly augmented. It is a striking fact that the number of persons killed or injured on railways throughout the United Kingdom is less than the number killed or injured by ordinary vehicles in London alone.*

Cost of travelling, meanwhile, instead of being increased by this wonderful accession of advantages, is greatly diminished, probably (fees and refreshments considered) by more than one-half.

The vast benefits of cheapness and speed thus secured to passengers are extended even in greater measure to the conveyance of goods, of coal and other minerals, of farm produce, and the like.

Further, and perhaps as remote from original expectation as any result yet obtained, railways and their officers (engineers and others) have made a most important addition to the defences of the country by affording extraordinary facilities for concentrating, in a remarkably short space of time, at any given point in the kingdom, a very large number of troops, horses and guns, together with, if necessary, a working corps of navvies.

* Companion to the Almanac, 1867, pp. 235–6.

Nor would it be right to pass over the liberality shown by the leading companies in providing for the religious, moral, and intellectual training of the children of their workmen, and in conveying passengers at low fares to great meetings for patriotic, religious, philanthropic, and scientific purposes.

Hawkshaw, 14,63–64. Teulon, 16,485, 16582–5. Chadwick, 17,200.

Lastly, in addition to all the advantages thus given to the public generally, the possessors of land and other fixed property in all districts traversed by railways have been enriched by the increased value of their possessions, to the extent, probably, in many instances of four fold.

It should be added, that all these results, so large and so beneficial, have been obtained with scarcely any expenditure on the part of Government, or subsidy in the way of rating, or subscription from the public at large.

3. In one sense the railway companies have met with great success, the actual amount of traffic far exceeding the most sanguine expectations of the original projectors. Such unexampled success should, in the natural order of things, be attended with large profit to those whose enterprise, perseverance, judgment, and capital have produced it.

For a time, indeed, profits were, all things considered, satisfactory, and the price of shares was high; but a reverse followed, which, with every allowance for the faults of the companies themselves, must be attributed mainly to mistaken legislation; a reverse which brought many, without any fault on their part, to disaster, some to ruin; and at present, notwithstanding some improvement of late years, railway property is apparently lower in the market than share property of almost any other kind. In short, those to whom the public owe all the benefits of this grand improvement have in the mass been sufferers by their good work; the total market value of share property in railways being now much below the amount originally invested therein.

Neither can it be said that railway proprietors have been consoled, under their grievous disappointment, by public gratitude; their services being little commended, while their failures are visited with severe animadversion and made ground of heavy penalty. It should not be forgotten, that the very permission to construct a railway is bought at a high price, Parliamentary expenses being heavy, and demands for land and buildings often exorbitant; agricultural land, in Mr. Bidder's opinion, being paid for on the average at four times its agricultural value; that again, while in common with the owners of other public vehicles, railway companies are taxed by the State, their lines, unlike the old roads, are heavily rated by every parish they traverse; so that in some rural districts a railway company, though perhaps on the one hand relieving the parish of much pauperism by giving profitable employment to the peasantry, and on the other hand lightening the pressure of the rates by increasing the value of the property on which they are levied, is yet made to defray, in a direct form, half the parochial expenditure.

Bidder, 17,177.

Teulon, 16,480–1.

Teulon, 16,482.

Teulon, 16,484.

In fine, railway companies have been made to feel, in the severest manner, that the justice which society observes towards individuals is seldom maintained towards a corporation; a loss distributed amongst many being too often regarded as, in effect, no loss at all.

4. It cannot be denied, however, that the injustice inflicted in various ways on the railway companies is too often retaliated upon individuals. No one can fail to be struck with the great amount of public dissatisfaction on the subject of railway management, of which, indeed, not a little has come before us in evidence. And it must be admitted, that there are points and occasions on which complaint is well founded, and that the grounds of such complaint it is important to remove. I shall endeavour hereafter to show means for attaining this end.

(B.)—Why Railways should belong to Government.—Competition.

5. The first suggestion of the purchase of railways by Government was made, I believe, by Mr. William Galt, who, as early as the year 1844, gave evidence on the subject before a Select Committee of the House of Commons, (having previously, in 1843, published his views in a work entitled "Railway Reform,") and who has subsequently at different times, by his writings and otherwise, recalled public attention to the matter. While, however, it is but right that Mr. Galt should receive all the credit due to the persistency and energy with which he has pursued an object to which he has devoted much time and attention, it is to be regretted that his zeal in urging a measure so valuable in itself should have led him into much inaccuracy of statement and undue enlargement of expectation. Mr. Galt's evidence before the Commission will be found at pp. 311 and 361.

6. Before the existence of railways, the public, as is known to all, travelled along roads, not the property of individuals or companies, but belonging more or less directly to the public itself. As these roads were open to all on payment of fixed tolls, there could be no monopoly of conveyance, either of persons or of goods; and, as many still remember, there was often sharp competition between rival coaches.

7. In the outset of the railway system the Legislature aimed at maintaining the same freedom on the new as on the old roads. For though, in this country, these new roads, being constructed by special companies, were nowise public property, still it was the intention of the Legislature that any one should have a right to use them for the conveyance of goods and passengers, on payment of the appointed tolls, as on common roads or canals, and tables of such tolls may still be found placarded at some of the older stations, the expectation being that competing vehicles would be established here, just as on the old roads. Wilson, 10,063 –8.

It is scarcely necessary to mention that these expectations have not been realized; probably in respect of passenger trains no such attempt was ever made; and even as regards the conveyance of goods, independent action was for the most part limited to a kind of wholesale use of the company's trains by established carriers. This is easily explained by the difficulties and dangers which, as is now well known, must ever attend disjointed proceedings, where arrangements are so complicated and the speed so great. Thus all expectation of benefit to the public from competition on the respective lines has been baffled by the mere force of circumstances. When, therefore, the Legislature and the public became aware that such competition was impracticable, they gradually laid aside their previous reluctance to the establishment of competing lines, and, on the contrary, began to look to these as the best means of securing reduced rates, accelerated speed, and increased convenience. Wilson, 10,069 –74, 100, 83. Stewart, 14,746.

The first effect of this relaxation was naturally a great loss to existing companies, whose lines had unquestionably been constructed in the expectation that they would not be exposed to direct competition, and whose profits were certainly never exorbitant, considering the efforts they had made, the vast risks run, the long period spent without return, and the immeasurable benefits conferred. "It is very hard," urges the Chairman of the Scottish North-eastern Railway Company, at a recent meeting, "for a company "paying only 2¼ per cent. to the original shareholders to be forced into parliamentary "contests, and to pay large sums on that account."*

As regards gain to the public from competition, while undoubtedly the reduction of fares was in some degree accelerated by the change, yet, considering the dangers and inconveniences produced by the economy, not to say parsimony, in appliances, almost inevitably resulting from reduced income, and bearing in mind the numerous and very serious accidents which have actually been thus caused, it may well be doubted whether the benefits gained, even by non-shareholders, have not been more than counterbalanced by accompanying evils; while to that large portion of the public who, amongst them, hold railway property, (often the investment of hard-earned savings) to the amount probably of nearly 500,000,000*l.*, the predominance of evil is beyond all doubt. Mathews, 10,581. Clarke, 12,803 –6. Huish, 15,877. Cawkwell, 11,675.

And here it may be well to notice a common but most erroneous impression, that in these ruinous competitions the shareholders are consenting parties. The fallacy consists in the generalization. Doubtless the shareholders of invading lines (in the comparatively few instances in which these are the property of real shareholders†) are consenting parties to the full extent, but the shareholders of existing lines are forced into the competition by the mere necessity of defending their property. And surely it should be matter for grave consideration of the Legislature, whether these shareholders should be exposed either to such necessity or to its disastrous alternative.

It must be borne in mind, that on all or nearly all lines of railway Parliament has a controlling power; as it has specially reserved authority to revise, as often as it shall think fit, the maximum rates of any line; so that any attempt to maintain unduly high rates can readily be checked. Stewart, 14,769 –72. Board of Trade, Appendix, B M.

Again, it has been found in practice, where competing lines have been established, that after a period of injurious rivalry, the companies have come to an understanding to charge equal rates, thus bringing competition to a close. It is also to be observed, that the traffic which would be ample for affording a reasonable profit to one line, is often quite insufficient for two, and thus Parliament, which in case of excessive profits might Hill, 8,410. Gibbs, 10,765. Galt, 7,426.

* *Times*, April 2nd, 1866.

† *Vide* statement by Lord Redesdale in the House of Lords. *Times*, March 14, 1866.

Cotton, 7,917–25. warrantably interfere to lower the tariff, is debarred from so doing from a sense of justice, and by the fear that a further reduction of profits, already too low, might render the safe working of the line impracticable. Thus a measure, adopted in the expectation that it would tend to produce low rates, becomes in effect a means of maintaining high ones.

Hawkshaw, 14,525–7. Stewart, 14,873. On this subject Mr. Hawkshaw gives it as his opinion, that competing lines in this country are one cause of our comparatively high fares. Mr. Stewart also holds, that bad legislation, by creating insecurity to railway property, deters existing companies from extension of lines and other improvements.

8. An exception to these conclusions seems to be found in lines that have to compete with natural water-carriage, whether by sea or river. The exception, however, is only apparent; for though in such cases railway charges, especially as regards goods, are often permanently lowered so far as the competition extends, that is between port and port, yet this is clearly because, as the number of possible competitors by water is practically unlimited, (the vessels employed being the only outlay, and these easily transferable to another line) permanent combination between the two parties is impracticable. But where railways only are concerned, the heavy expense of constructing new lines obviously brings the number of competitors within very narrow limits; and as combination is always practicable where possible competitors are few, competition soon comes to an end.

Wilson, 9,911–2.

Hill, 8,041.

9. In short, experience has now shown that railways are essentially monopolies; consequently they are, in my opinion, not suitable objects for ordinary commercial enterprise, in which each party, while striving for its own interests, generally contributes, perhaps in the best possible way, to the interest of all. It seems to follow, that they cannot be advantageously left to independent companies, who of course manage them with exclusive reference to their own interests, but that they should be in the hands of those who will control the management of them with a view to the interests of the country at large, that is to say, in the hands of Government.

Gibbs, 10,765. Chadwick, 17,200.

In proposing this, however, I do not mean to recommend that any Government board should take upon itself, in the gross, the duty now performed by railway directors. For the direct management of the lines I propose to provide by leasing them out, in convenient groups, to companies, partnerships, or individuals, as the case may be. An opinion in favour of leasing the lines will be found in the evidence given by Mr. Bidder before this Commission.

Bidder, 16,793–806.

What I recommend is, that either a department of Government should be created, or the superintendence of railways committed to one of the existing departments, and that the controlling power thus established should act as lessor, not only in granting leases, but also in fixing suitable terms and enforcing due observance of contract.

10. The following conclusions, taken chiefly from the evidence of Mr. Frederic Hill, embody, in some detail, the plan which I recommend for adoption:—

Hill, 8,267.

1. That it is expedient that the State, first subjecting the accounts to a rigid investigation, (the necessity for which has been shown by recent events,) should gradually purchase the railways, but that it is not expedient that it should undertake their management.

2. That while the purchase of the railways might be made in single payments by the creation of a corresponding quantity of Government stock, such creation is not necessary, since the purchase could be effected by means of a fixed annual payment, like the rent of a Scottish feu, and in the form of a dividend on the shares of each railway, and of interest on its debentures. Some such arrangement is now generally made when one company becomes possessed of the line of another.

3. That in order to save Government from the insurmountable difficulties which would be produced by its having to deal with the railway proprietors in detail, power be obtained to enable each of the three classes of ordinary shareholders, preferential shareholders, and holders of debentures, to decide on the question of sale by a majority as determined by the aggregate amount of interest in the undertaking; the Government, of course, not being bound to abide by its offer, unless all three classes agree.

4. That, as a general rule, the rate of dividend and of interest should, in each instance, be a matter to be freely agreed upon between the railway proprietors and the Government without resort to compulsion, and therefore without resort to arbitration; any railway, in the event of a failure in the negotiation, to remain, so long as the failure continues, in the hands of the present owners.

5. That, nevertheless, since the right operation of the measure might be thwarted by the resistance of some few companies (moved by the hope of obtaining exorbitant terms), the Government should be enabled, in case of a very general concurrence of the railway companies, to enforce sale upon the others,—of course upon equitable terms,—in the same manner as they themselves have enforced sale of land upon the public.

6. That the Government should let each railway on a lease, as a landed proprietor lets a farm;

such lease to be either for a number of years, or terminable at a moderate notice, as may, in each case, be judged most expedient.

7. That the rent to be demanded should, in each instance, be calculated to pay the dividends, the interest on the bonds, and all incidental expenses—in a word, calculated to make the railway self-supporting, and, in addition, to yield a surplus, in proportion to the magnitude of the railway, to go towards a fund to make good any loss which, contrary to expectation, may, in the case of some few railways, be entailed by their purchase.

8. That the rent should be paid, if not in advance, yet at short periods,—say monthly, or even weekly,—so as to afford considerable security to Government, and thus bring the necessity for additional guarantees within such moderate limits as would enable even individuals to become lessees.

9. That, *cæteris paribus*, a railway should be let to those parties who, while undertaking to pay the required rent, will agree to adopt the lowest tariff of charges, as well for passengers as for goods.

10. That the leases should be so framed, as to empower the Government to require that all due precautions be taken for safety, such as observance of punctuality, and affording means of communicating with the guard; and also for the conveyance, at a moderate rate of charge, of the mails.

11. That the leases should further provide for keeping the railway, bridges, viaducts, and embankments constantly in a good state, and for maintaining the rolling stock at its full value, and for any necessary further extension of capital;—and that to attain these and other objects, frequent Government inspection should be made, and the lessees should be bound immediately to make good any deficiency.

12. That, at the termination of a lease, and at any intermediate time, if either party desire it, the whole property should be assessed, and any falling off made good by a money payment; while, on the other hand, the company should be indemnified for any increase in value, provided the consent of Government shall have been obtained to the measures causing such increase.

13. That if the increase in value be large, and it be deemed inexpedient to pay for it out of the National Exchequer, the necessary funds may be raised by the creation of additional shares in the railway.

14. That under a like arrangement for raising the funds, the Government should give their consent, from time to time, to the construction of new branch lines to a railway, or to a prolongation or other alteration in the main line.

15. That as respects the construction of lines altogether new, the Government might either agree beforehand on what terms (either by means of a single payment or in the form of a dividend) they will buy the line, provided the work be well done, or allow the business to proceed spontaneously, as at present, the proprietors being at liberty, when their railway is complete, either to continue their ownership, or, upon terms to be mutually agreed upon, to sell the railway to the Government. Another and perhaps a preferable mode will be described hereafter.*

16. That provision should be made for the equitable and ready settlement of any disputes that may arise between the Government and the lessees.

17. That the plan described in this summary might be tried experimentally by the purchase, in the first instance, of some one railway, or, say, of all the Irish railways.

11. Mr. Frederic Hill anticipates the following benefits from the plan, and in these anticipations I concur,—

"(1.) The acquisition by the State of a property of greater value to it than its price.

"(2.) The receipt by the proprietors of railways of a dividend somewhat higher than that of which, if the railways remained their own property, they could have any reasonable prospect; such dividend, moreover, being rendered certain in amount, and free, therefore, from its present liability to great fluctuation.

"(3.) A cessation, to a great extent, of fierce struggles to obtain legal authority to construct new railways, with the consequent saving of the cost of such struggles, of the time and attention of Parliament and of the directors of railways and others, the saving of the expense of making railways which are not really needed, and the prevention of all unnecessary invasion of private property or of places set apart for public recreation.

"(4.) A large reduction in the fares of passengers and in the freight of goods, with the consequent increased facilities for locomotion and for the further development of trade and agriculture; especially, in the latter case, by the greater ease that would be created for the intermixture of different kinds of soil and for the conveyance of manure, including town sewage.

"(5.) Facilities for obtaining, under comparatively safe arrangements, 'running powers,' or, yet better, for so adjusting the working of the different railways as to make the trains of every line coincide at the terminal points with those of its neighbouring lines.

"(6.) Greater securities against accidents, and also against assaults and robberies on railways, by the establishment of a uniform system of signals, and by clauses in the leases imposing penalties for unpunctuality and other irregularities, and requiring that means should always be provided for enabling passengers to communicate readily with the guard.

* *Vide* para. 27.

"(7.) Facilities for so arranging the traffic of the country that, as far as practicable, passengers and goods may be conveyed on different lines.

"(8.) Facilities for abolishing the present varieties of gauge.

"(9.) Additional facilities for the conveyance of the mails, with a consequent increase in the number of posts, and in the celerity of communication, and removal of the chief difficulty in the establishment of a parcels post."

It is important to observe, that the plan of leasing out the lines would naturally lead to that wholesome competition which is at present so great a desideratum. Of the futility of competition between line and line I have already spoken, but this plan would *in effect* secure that competition upon the respective lines which was originally contemplated by the Legislature, and that without the dangers to which the original plan would have given rise. The number of possible lessees being practically unlimited,—since by the proposed arrangement the necessary investment of capital would be moderate,—combination against the interests of the public would be impracticable. In short, to use Mr. Chadwick's expressive phrase, we should have "a competition for the field, though "not competition in the field;" and as the criterion taken for decision amongst qualified candidates would be comparative lowness of fares and rates, this competition would tend directly to its most desired result.

Add. to Mr. Chadwick's evidence, page 855.

I am of opinion, that the system of management by lessees would be found to have important points of advantage alike over the existing system of management by directors, and over any plan of direct management by the Government itself. This last, indeed, seems to meet with condemnation on almost all sides; the chief objections raised being the want of a direct interest, the want of thorough knowledge or peculiar aptitude, the habit of costly management, and the danger of abuse in patronage. Now those conversant with railway affairs can scarcely have failed to notice, that to some at least of these objections the present system is in no small degree liable. Thus, when it is considered that the gentlemen now acting as railway directors have almost without exception other occupations claiming more immediate attention, and involving nearer interests, it must obviously be difficult for them, even if they are selected for their posts by peculiar aptitude (whereas many other considerations notoriously intervene), to acquire that thorough skill which usually appertains only to an exclusive profession. Again, to the interests of the company there are sometimes opposed, in the minds of individual directors, interests of their own, the latter, it is to be feared, occasionally getting the mastery; and the selection of subordinates is too often guided by considerations very analogous to those alleged in the matter of Government patronage.

Cawkwell, 12,316–9. Harrison, 15,351. Bidder, 16,586. Allport, 5,285–98.

On the other hand, a small body of lessees having to manage not for others but for themselves, and having consequently large and direct interests at stake—often, too, prompted to undertake the charge by a consciousness of peculiar aptitude—would doubtless be led to make railway management their sole calling, and to pursue it with such zeal as would enable them to acquire that high skill so often shown in other professions; while mere self-interest would secure them, so far as commercial partnerships ordinarily are secure, against selection or retention of subordinates by any other criterion than fitness.

And here it may be observed, that men gifted with sagacity in the choice of subordinates, and with other qualifications for railway direction, would, in the ordinary course of competition, obtain the preference over inferior candidates; since by superior management they would be able to afford equal convenience at lower rates; and thus the arrangement would tend to secure to the public the most efficient management combined with the lowest fares.

12. Some difficulties appear at first sight to attend the plan of leases in relation to the rolling stock. Different modes of overcoming these have been suggested by Mr. Bidder and Mr. Frederic Hill. Another, and perhaps more eligible mode, would be for the lessees to contract for the supply with one or other of the rolling stock companies which have already adopted the practice of supplying engines and carriages on payment of mileage rates for their use, in a manner similar to that in which the Post Office was formerly so well supplied with mail coaches. And to such companies the rolling stock on the purchased lines would doubtless be transferred, on equitable terms, by the Government.

Bidder, 4,219, 16,794. Hill's suggestions, par. 11.

13. Amongst the reasons for the transfer of railway property to the Government, not the least important is the effect which such transfer would have in giving to this kind of property that stability in which it is now so notoriously deficient.

The importance of affording the public a secure depository for its savings has of late

been distinctly and most beneficially recognized by the Legislature in the establishment of a National savings bank based on National security; and surely the same consideration should lead to the adoption of measures which, with no loss but great gain to the public at large, would give like security to the enormous amount, (probably almost 500,000,000*l.*,) now invested in railway enterprise. As has been already stated, fluctuations in the value of railway property have been detrimental to very large numbers, and to not a few, probably ruinous.

Nor, under present arrangements, is it likely that the means will be found of removing this injurious uncertainty. Any one who has watched the whole course of railway legislation must see that it has followed no fixed principle, but has varied from establishing apparent monopolies towards a disposition to admit unlimited competition; so that those who embarked their property on the former understanding find themselves every year more and more subjected to risks proceeding from the latter course; until at length, as has been already intimated, there seems to have arisen an organized system of depredation on railway property for the benefit of unscrupulous speculators. The reasons for transferring the general control of our railways to other hands appear to have been greatly strengthened by recent events. Some lines appear to be sinking into bankruptcy, others have confessedly fallen into that state, and the way to deal with such lines has already become a perplexing question. It is extremely improbable that a company in a state of bankruptcy can work its line in a manner consistent even with public safety.

14. In recommending the gradual transfer of railway property to Government I deem it necessary, with a view at once to obviate public jealousy and to secure efficient management, urgently to advise that the selection of the Head of the Department should be made in exclusive reference to fitness for the post; that the Department should be put entirely out of the range of political action; that as the duty to be performed would be one of great difficulty, labour, and importance, requiring the highest qualifications that can be procured for the purpose, the head of the Department should be unaffected by changes in Government, and, to make his responsibility complete, should have the uncontrolled appointment and dismissal of all his subordinates, leaving, of course, to the several lessees equal freedom as regards those under them.

15. The following extract from the inaugural address delivered by the late Mr. Robert Stephenson as President of the Institute of Civil Engineers is strongly confirmatory of the views expressed above in reference to the establishment of a separate tribunal or board for the general control of railways. "What we ask is knowledge; give us a "tribunal competent to form a sound opinion; commit to that tribunal, with any restric- "tions you think necessary, the whole of the great questions appertaining to our system. "Let it protect private interests apart from railways; let it judge of the desirability of "all initiatory measures; of all proposals for purchases, amalgamations, or other railway "arrangements. Delegate to it the power of enforcing such regulations and restrictions "as may be thought needful to secure the rights of private persons or of the public; "devolve on it the duty of consolidating, if possible, the railway laws, and making such "amendments thereon as the public interests and the property now depending on it may "require; give it full delegated authority over us in any way you please; all that we "ask is that it shall be a tribunal that is impartial and that is thoroughly informed, and "if impartiality and intelligence are secured we do not fear the results."

(C.)—Reduction of Rates.

16. Under the proposed arrangement, and indeed the same may be said in the main of the present system, the conditions of cheap and safe conveyance are:—

First. Economy in original outlay.
Second. Economy in current expenditure.
Third. Skill and care in adapting arrangements to public requirements and convenience.
Fourth. Punctuality.

17. (1.) The importance of the first head is forcibly shown by the fact that at present more than half the gross receipts go to cover interest (or dividends) on capital. Under this head the principal points for consideration are the following:—

(*a.*) *Preliminary expenses;* viz., those of surveying and planning the road, of fulfilling the requirements of the law, and of carrying the Bill through Parliament.

Here the main economy to be effected must be in Parliamentary expenses. The new circumstances would seem to admit of a general law which might render detailed application to Parliament unnecessary, by empowering the Government, under strict limitations and proper securities, to authorize the construction of railways where required for the public advantage; and thus the enormous cost of railway legislation would be avoided; a cost frequently absorbing an important fraction of the whole capital.

Stewart, 14,848–52, 14,885. Chadwick, 17,184–7.

(*b.*) *The purchase of the land, &c.*—It is notorious that under the present system exorbitant prices often have to be paid through fear either of Parliamentary opposition or of partial awards of juries. This will better appear, when it is stated that in the purchase of land for railway purposes, the amount actually paid is, as already stated, often several times the antecedent value. By the enactment of a general law, the former fear would be removed; and as regards the latter, it would be for the Legislature to consider whether, in respect of lines constructed by authority of Government solely for the general welfare, it would not be just, while carefully respecting all legal rights, to consider, in the assessment of compensation, what set-off against the value of the land required should be allowed for increased value given by the line to the rest of the estate. The fairness of this principle has been, in some measure, tacitly admitted by the fact, that, in several recent cases, lines have been constructed at the instance, and to a large extent at the risk, of the landholders interested.

Chadwick, 17,200. Teulon, 16,582–5.

(*c.*) *The construction of the line, erection of stations, &c.*—Though the proposed arrangement may have little effect in lessening the expense of construction, so far as relates merely to the lines originally projected, yet it would be very effective by removing the necessity for making unremunerative branch lines; the construction of which is often forced upon a company by the threat of new lines to compete with the main line. The public convenience, however, would be duly consulted by the construction of the less costly "Railroad By-ways," of which I shall speak hereafter.

18. (2.) Under Economy in current expenditure the principal savings to be effected are as follows:—

(*a.*) *In the Parliamentary expenses of defending the line against actual or threatened opposition;* an expense now absorbing a large portion of the profits; many projects known as "contractors' lines" being undertaken,—and that generally in evasion of the standing orders of Parliament,—with no view whatever to public benefit, but simply to prey on existing companies by compelling them to purchase the same. A reference to the evidence of Mr. Stewart, the late experienced secretary of the London and North-western Railway Company, will show how greatly these factitious projects injure the interests of the public, by causing, in existing companies, such a feeling of insecurity as deters them from extensions, reduction of fares, and other improvements really productive of public benefit. Such aggressions would obviously be prevented by the proposed change.

Harrison, 15,313–26. Gooch, 17,509.

Stewart, 14,873.

(*b.*) *In limiting the expense of working unremunerative lines* to those already constructed; instead of it being, as now, subject to constant increase by the enforced construction of new branches, as mentioned above.

(*c.*) *In diminishing the present expenses consequent on accidents.*—The means of effecting this are described elsewhere (par. 28).

(*d.*) *By the amalgamation of unimportant lines;* some of the present undertakings being so small that the expenses of management are beyond all just proportion to their receipts.

(*e.*) *In relief from taxation.*—Should railway property be transferred to Government, the change will naturally open the question of continuing the tax on railway travelling; and it is scarcely needful to say, that as soon as the revenue can spare the amount involved, it is desirable that this and every other mode of conveyance should be relieved of an impost so obviously objectionable; a relief the more equitable, seeing that *in Ireland the impost does not exist.*

Forbes, 1,674.

As regards local taxation, the injustice of the present system has been spoken of elsewhere (par. 3); and as there seems to be no reason why railroads, after becoming national property, should be rated while other roads remain free, and as at the same time it cannot be to the interest of the nation at large to tax its own property for *local purposes,* thereby taking money out of one pocket to put it in another,—raising the fares to lower the rates,—it appears reasonable that, as a part of the whole plan, such local taxation should be abolished.

(*f.*) *In reducing the large amount of waste room now so observable in almost every train.*—One obvious cause of such waste is to be found in the distinction of classes. It seems probable that a great reduction in fares would warrant a reduction in the number

Stewart, 14,821–40.

of classes to two; since, where privacy was desired, it could be secured, at low cost, by any party paying for the vacant places in the compartment occupied. An additional saving of room, and probably also of time, would result from a regulation requiring passengers, when leaving or joining main lines, to change from one carriage to another; and although this can hardly be expected at junctions, where the number to be transferred is large, yet seeing that it would not only economize time, but also tend to a large reduction of fares, it might fairly be required where the number transferred would be small. Mr. Stewart, who strongly supports most of the views here expressed, adds, that their realization would be greatly aided by arrangements tending to produce harmonious action between different lines; which, as he remarks, would be the obvious result of general amalgamation. Stewart, 14,816.

19. (3 & 4.) The remaining heads are "*Skill and care in adapting arrangements to public requirement and convenience*," and "*Punctuality*" These will, I think, be secured, and that in the highest degree, by the proposed plan of leasing out the lines (pars. 10 to 12).

(D.)—How a small Reduction in Expenditure may cause a large Reduction of Charge.

20. Although it is now generally understood that economy in the construction of a line, though highly important to the shareholders, has no natural tendency to produce low fares, yet it is obvious that such economy must increase the *ability* to reduce; and certainly, on the lines in the hands of Government, such ability would have practical effect. Even on other lines, were the outlay reduced, Parliament might thereby be justified in exercising the power now generally secured to it by a clause in railway acts commonly expressed in the following terms:— Galt, 7,341. Smithells, 13,048–51 13,080.

"And be it further enacted, That nothing herein contained shall be deemed or construed to exempt the railway by this or the said recited Acts authorized to be made from the provisions of any general Act relating to Railways now in force, or which may hereafter pass during this or any future session of Parliament, or from any future revision and alteration, under the authority of Parliament, of the maximum rates of fares and charges authorized by this Act [or by the said recited Acts.]"

By reduction in current expenses, however, reduction in fares is promoted more directly and efficaciously: for while, equally with economy in outlay, it creates *ability* to reduce, it also—as may be shown—renders reduction, to a certain extent, an act of sound policy even as regards simple profit.

Now supposing the plans above recommended to be adopted,—including relief from taxation, whether national or local,—the total reduction in railway expenses would unquestionably be large; and this would obviously justify a proportionate reduction in fares and rates of charge. But a little consideration will show, that such reduction would by no means stop there; for as every reduction in fares, &c. produces increased traffic, it naturally tends to further reduction; which again from being an effect becomes a cause, and so on.

(E.)—The Post Office.

21. On reference to the evidence of Mr. Frederic Hill, Assistant Secretary to the Post Office, Mr. Edward Page, the Inspector-General of Mails, and Mr. Gregory, C.E., the Arbitrator for the Post Office, it will be seen that the laws regulating the relations between the railways and the Post Office are at present in a state unsatisfactory to both parties; the dissonance necessarily producing inconvenience to the public, owing to the restrictions which it places on the use of trains for conveying mails, and the consequent impediments to the extension of postal facilities.

22. I concur with Mr. Frederic Hill in recommending that, as fast as lines become national property, clauses be inserted in the respective leases, entitling the Post Office to such use of the lines as may be necessary for its purposes, and that at specified rates of charge; such rates being so arranged as to remunerate the lessees and afford them a moderate profit,—say 25 per cent. on the bare additional cost of the service.

As regards lines remaining in the hands of the present companies, it appears advis-

able that whenever railway companies come before Parliament for fresh powers, advantage be taken of the opportunity thus afforded, by requiring the companies to perform the postal service at specified rates regulated on fixed principles, and providing for all ordinary contingencies; any existing contracts which may have a fixed term to run being allowed to continue in force until they shall be terminated in the ordinary course, under the conditions for that purpose provided in each contract. The rates should be considerably higher than those recommended for insertion in the leases.

As regards the use of such trains as may be run by the companies for their own purposes, I concur with Mr. Page and Mr. Gregory in opinion, that the rate of charge to the Post Office should be based upon the rate of charge which the companies make to the public for similar services; due allowance being made to the Post Office for the extent and regularity of its custom, and for its performing the duties of collection and delivery.

Page, 14,972. Gregory, 17,684–96, 17,749.

As regards trains specially ordered and controlled by the Post Office, I am of opinion that, except in a few very peculiar cases, the payment for the service should also be according to a fixed scale; and this I think should be so regulated, as at once to cover the additional expense to which the company may be put by the Post Office requirement, (after fair deductions for any use of the train made by the company itself) and to yield on the sums thus ascertained the ordinary 100 per cent. required for interest of capital, &c., and profit.

Gregory, 17,670.

This I propose, not as a perfect plan, but as more convenient and even more equitable than the plan now in use.

23. The following tariff is based on the above principle, and is accordingly recommended for adoption, as regards railways not belonging to the State:—

Tariff of Rates to be paid for the Conveyance of Mails by Trains under fixed notice.

First. Trains exclusively employed by the Post Office.

	On the narrow gauge.	On the broad gauge.
For a train (consisting of an engine and the usual break van) and one separate carriage for the mails - -	2*s.* 4*d.* a mile.	2*s.* 6*d.*
For every additional separate carriage (the number and distance to be run by each being varied from time to time according to the exigencies of the service), an additional rate of - - - - -	3*d.* „	4½*d.*

In cases where the distance between the stations—between which the mail train is required by the Post Office to run—is less than 50 miles, the distance to be paid for shall be increased by one-fourth part of the difference between the actual distance and 50 miles.

In all cases where a mail train is required to run in only one direction, the mileage to be paid for shall be assumed to be greater by 50 per cent. than the distance actually ordered to be run; and again, where the distance so augmented shall still be less than 50 miles the payment shall be further increased in accordance with the rule laid down in the preceding paragraph.

When mail trains are run during the night, (*i. e.*, between 10 p.m. and 6 a.m.), an addition shall be made to the mileage charge payable by the Post Office for the distance actually required to be so run; such addition being determined by dividing the sum of 6*d.* among all the trains run in the night, whether Post Office trains or not.

Second. Trains not exclusively employed by the Post Office.

From the rate which would be chargeable against the Post Office if the train consisted only of the carriage or carriages required by the Post Office as above, a deduction to be made for every carriage of whatever description run in the train for other than Post Office purposes, (the company having a right, as above, of varying the number of such carriages), at the rate of 4*d.* per mile on the narrow gauge and 6*d.* per mile on the broad gauge; provided, however, that the rate remaining to be paid by the Post Office shall in no case be less than the rate which would be payable for the use of an ordinary train under the tariff herein-after prescribed.

That in the event of any company satisfying the Board of Trade, or other Government Board yet to be appointed (as suggested in this report), that owing to circumstances not herein provided for, it has a claim to additional payment, the same shall be made.

Tariff of Rates for the Conveyance of Mails by Ordinary Trains.

First. When the Post Office requires a prescribed amount of space, and employs its own guard to exchange bags, &c.

	On the narrow gauge.	On the broad gauge.
For the exclusive use of one compartment of a carriage, second or any inferior class, at the option of the Post Office	2*d.* per mile.	2*d.*
For do. of two compartments	4*d.* „	4*d.*
For „ three „	6*d.* „	6*d.*
For „ four „	—	8*d.*
For whole carriage	8*d.* „	10*d.*

And for any additional carriage or portion of a carriage, at the same rates.

Gregory, 17,686–94.

Second. When the Post Office does not require a prescribed amount of space, and the mails are exchanged by the train guard,

For every 112 lbs. ordinary maximum aggregate weight of mails, $\frac{1}{2}d.$ per mile; any portion of 112 lbs. being considered as 112 lbs. Gregory, 17,698–701.

In the event of the Post Office requiring a carriage or carriages exceeding the ordinary dimensions, (by which term "ordinary dimensions" is meant carriages whose interior horizontal sectional area does not exceed in the case of the narrow gauge 150 square feet, and in the case of the broad gauge 225 square feet,) the company shall have a right to call upon the Board of Trade to increase the charge for such carriage or carriages by an addition to the tariff rates proportionate to the increased size of the carriage or carriages; and on the other hand, should the company, for its own purpose, run one or more carriages exceeding the ordinary dimensions, as above, in any mail train not devoted exclusively to the Post Office, then the Post Office shall have a right to call upon the Board of Trade to determine in like manner the increased amount of deduction in respect to such larger carriages.

The compensation for insufficient notice of the abandonment by the Post Office of a mail train under notice shall be one-fourth part of the full payment for the difference between the actual notice and the required notice of six months.

24. The other difficulties pointed out in Mr. E. J. Page's evidence seem to indicate that the law with respect to the mail service on railways also requires alteration or extension in the following particulars, viz.:—

First. The Post Office should have the power of *requiring* railway companies *by legal notice*, when necessary, to run mail trains to be employed exclusively in the conveyance of mails and officers of the Post Office. Page, 14,963.

Second. The right of a mail guard or other Post Office servant, when travelling and paying his fare as a passenger, to exchange bags at intermediate stations without additional charge,—provided the aggregate weight of mail does not at any time exceed that allowed to a passenger of the same class,—should be made clear. Page, 14,960.

Third. The right of the Post Office to require for a mail guard or other Post Office servant a monthly, quarterly, or annual or other periodical ticket, at the same charge as is made to the public for the same distance and for the same period, should be made clear. Page, 14,962.

Fourth. The mode of calculating the rate of travelling of a mail train,—making allowance for the difference between the stops of the company's fastest train and those of the mail train required by the Post Office,—should be clearly defined. Page, 14,963.

Fifth. The right of the Post Office to insist upon the erection and use of the mail-bag-exchanging apparatus at the cost of the department, should be made clear.

In another portion of his evidence Mr. Edward J. Page dwells on the practicability and importance of establishing a small-parcel post at a uniform rate of charge; pointing out at the same time the peculiar facilities and advantages, for this purpose, which are afforded by the organization and machinery of the Post Office; so superior in their operation and extent to any possessed by railway companies. Page, 14,985, 15,009.

It appears highly desirable that, as fast as railways become national property, provision should be made in the leases for giving effect to these views; and in the meantime, fully believing that the plan would prove beneficial to railway interests as well as to the public, it is hoped that arrangements for the purpose may be made (as suggested by Mr. Edward Page) for attaining the same end with the concurrence of existing companies. Page, 15,009.

(F.)—Extension of Railways.

25. As it is obviously probable that most lines yet to be constructed in the United Kingdom will be of moderate length, (chiefly branches for carrying the system into rural districts) the question of Railway Extension is here considered mainly with reference to what may be called

Railroad By-ways.

26. In considering the pecuniary results of railway operations, it is striking to observe, that more than half the gross receipts (53 per cent.) is required to meet the claims of capital; part being paid over in the form of interest, the rest as dividends. It is obvious, therefore, that if a line could be so constructed as to involve no such claims, the present rates and fares might be reduced by more than one-half, without making any allowance for the increase of traffic sure to follow such reduction.

Now it is notorious that not only the construction, but also the maintenance of the common by-ways fall, more or less directly, upon the landed and household property benefited thereby; and it may be added, that in some instances this is roughly in proportion to the benefit conferred. It may, therefore, reasonably be inquired, whether the principles thus established as regards the existing by-ways may not be safely, justly, and beneficially applied to that better kind of by-ways by which they must, in the natural course of things, be gradually superseded. It may be observed, that the principles in question have recently been applied (by the law of 12th July 1865,) to the construction of branch railways in France; and it appears that, under the operation of this law, many branch railways are already in course of construction.

The mode in which the expense of draining the fens is met, viz., by rates on the land benefited, furnishes another precedent in support of the principle now proposed.

In order, however, to render the application of this principle to railways the more feasible, it is obviously important to reduce the cost of construction to the lowest amount practicable.

Section C., part 1.

Arrangements have already been suggested with a view to free railway extension from the heavy Parliamentary expenses with which it is now clogged,—arrangements which it is reasonable to hope will be more operative than the dormant and almost unknown power which is vested in the Board of Trade, by which, in cases where there is no opposition from the owners of the required property or from railway or canal companies interested, application to Parliament may be rendered unnecessary. And I am of opinion that further economy may be obtained as regards both the purchase of land and outlay in construction.

Chadwick, 17,184.

Harrison, 15,402.

Mr. Harrison states, that on a branch line constructed by him in Yorkshire, viz., the Thirsk and Malton line, partly by liberality in the landholders and partly by avoiding all but the most necessary expenses, the total outlay (exclusive of rolling stock) was not more than about 4,000*l.* per mile; so that, allowing 1,000*l.* per mile for rolling stock, (which is more than sufficient) the total outlay for enabling the company to open the line was but 5,000*l.* per mile.

In cases where the expenses of an ordinary line could not be brought within this amount, resort might be had to the plan of construction used by the Indian Tramway Company, also in Norway, Queensland, and to a slight extent even in this country; a plan which seems perfectly applicable to the rural districts of the United Kingdom. This consists in limiting the railway to a single line, and in using a very narrow gauge, which admits of sharper curves, and, by lightening both engines and carriages, also admits of lighter rails.

Harrison, 15,390–4. Stewart, 14,866–72. Chadwick, 17,181–7.

Of course I am aware of the inconveniences arising from break of gauge, and therefore make this recommendation only as a means of railway extension where expense would render the ordinary gauge impracticable.

As regards purchase of land, it may be assumed that as, on the plan suggested above, the cost of the land required for the by-way in any district would fall upon the property generally, public opinion within the district would check any exorbitant demands in the sale of such land.

Harrison, 15,402.

Supposing these points to be secured, and thus the primary outlay brought within an average of 5,000*l.* per mile, including stations, rolling stock, and every other expense, the annual interest on capital would not be more than 250*l.* per mile.

It remains for consideration, 1st, What rate levied upon the property benefited would suffice to pay this interest? And 2nd, Whether the amount of benefit would suffice to cover the rate in question?

Assuming, as I safely may, that the benefit would extend to an average distance of 4 miles on each side of the railway, the advantage would be spread over a space of 5,120 acres for every mile of railway; and an average rate on this of 1*s.* per acre would produce 256*l.*; or a trifle more than the sum required. Teulon, 16,582–5. Hawkshaw, 14,645. Chadwick, 17,181.

Now surely it may be taken for granted that the increased yearly value given to the land, houses, mines, quarries, and other property, within the assumed range would, after every allowance for waste lands, roads, &c., largely exceed the average of 1*s.* per acre on the land alone; and if so, not only would the railway be made and furnished with rolling stock without real cost to any one, but the owners of property in the district would, in addition to the convenience shared with the public in general, derive a large pecuniary benefit to themselves in especial; while both advantages would be much increased by the very low rates of conveyance—probably less than half the present rates—which the proposed plan would secure. Hawkshaw, 14,642. Teulon, 16,584.

It may be added that, upon lines of so limited a traffic, and where high speed would be unnecessary, sidings might be as frequent almost as farms; and thus unusual facilities might be afforded for the conveyance of farm produce in one direction, and of manure, &c. in the other.

And here it may be observed that, as a means of yet further economy, it might sometimes be found well to substitute horses for locomotive engines, (at least in the first instance) as loads would be light, distances generally short, and speed of minor importance. Chadwick, 17,181.

Such an extensive ramification of the railway system—probably exceeding in the aggregate the whole length of line now in existence—would not only greatly facilitate conveyance within the districts served, enabling labourers to pass at a trifling charge to and from their work, but by bringing almost every village into connexion with every town, and, indeed, with every other village, would extend the means of intercourse, the spread of literature (especially of newspapers), the conveyance of letters, and, in short, every means of civilization to a degree beyond calculation.

Neither can it be out of place to remark, that the influx of traffic thrown into the general system by these subsidiary railways would add largely to the traffic on the existing lines, and thus, on the arrangements proposed, lead to further reduction in the rates of charge thereon.

As a means of giving effect to the above recommendations, it is proposed that where a railroad by-way is contemplated, the holders of property within the prescribed limits, acting with the advice and concurrence of the contemplated Government Board, shall have power to authorize the construction of the railway, including the enforced sale of land and the levying of the necessary rate; the whole to be in accordance with the provisions of a General Act, which should also provide for borrowing the necessary capital, and for the construction of the road under direction of the board or otherwise, at the option of the parties contributing; and as such parties would be relieved of all trouble and responsibility by transferring the line, with its encumbrances, to Government, at its completion, if not at its first undertaking, they would naturally be inclined to adopt that course without any demand for payment, but with a mere stipulation that the tariff of charges should be kept within certain narrow limits. Indeed such transference might not unfairly be made an essential condition of the grant of powers as above.

Longer Lines.

27. Although, however, as already observed, railway extension will probably, henceforth, imply mainly the construction of short subsidiary lines, yet cases may arise, from time to time, in which longer lines will be required, and to which the foregoing plan could not be applied without modifications.

In such cases, probably the most eligible plan would be to transfer to the contemplated Government Board all those duties relative to the subject which now devolve upon Parliament, leaving, however, (as in the case of the by-ways,) to those whose property would be affected,—acting as a body,—a veto on the proceeding;—the expense of construction, &c., to be defrayed partly by rates on the property benefited, (as in the case of the by-ways,) and partly at the National charge, either by direct contribution, or by an augmentation of the railway stock which it is proposed to create for the purchase of existing lines.

But should Parliament, not content with that general control which it exercises over all Government departments, be unwilling to delegate such important power to

a permanent board, an alternative would be to limit the delegation to such powers as are now exercised by the Officers and Committees of Parliament.

Should Parliament object even to this limited delegation, the present course of proceeding might be retained, with the mere substitution of the Board for a Company.

Finally, should the present course of Parliamentary proceeding remain absolutely unaltered, still, supposing the existing lines to be in the hands of Government, railway bills, when calculated to supply a real want, and that of sufficient magnitude to warrant the action of Parliament, would no longer be exposed to the costly opposition which now frequently arises when the project appears to threaten the interests of some existing company; for doubtless, if the threatened line belonged to the State, the lessees would know that a simple demonstration of injury would obtain a proportionate reduction of rent. Parliament, also, should, and probably would decide questions as to the construction of new lines, much as such questions would be decided if all lines belonged to one company, and the decision rested with a general body of directors, who took an enlightened view of that company's interests, *i. e.* it would consider whether it would be to the interests of the country at large, as proprietors of the railways, that the additional outlay should be made.

Hill, 8,267. Supposing the present plan of proceeding to remain unaltered, it might be well, as suggested by Mr. Frederic Hill, that when any new line has been sanctioned by Parliament, the Government should either agree, at the outset, on what terms (whether by a single payment or in the form of a dividend) they will buy the line, provided the work be well done, or allow the business to proceed as at present, the proprietors being at liberty, when the railway is complete, either to continue their ownership, or, upon terms to be mutually agreed upon, to sell the railway to the Government.

In comparing the above modes of proceeding with one another, it may be expedient to inquire what would probably have been the result, if the plan recommended as the best had been adopted from the first; a course, however, which it must be admitted would have encountered great, possibly insurmountable difficulties.

1st. The vast expense of Parliamentary contests would have been avoided.

2nd. The cost of construction would have been greatly diminished.

3rd. The waste of capital in unproductive lines would have been avoided.

4th. Railway extension, so far as relates to lines really useful, would have been carried far beyond its present limits. For many railways which could afford no remuneration to a company of proprietors, would be highly profitable to the community at large.

5th. All classes employed in railway construction and management would have derived corresponding benefit.

6th. The fares and other charges for railway conveyance would probably have been less than half of those actually demanded.

7th. Though the owners of land and other property served by railways would have received but a simple remuneration for whatever they gave up, and would have been called upon to contribute to the cost of construction, yet, through the above-named advantages, they would have derived such benefit in the increased value of their property, that the balance in their favour would, in all probability, have been even greater than at present.

Lastly, there would now be a National Property, in the hands of Government, of enormous value, sufficient to constitute a large set-off against the National Debt.

It seems not useless to add, that while, as regards existing lines, it is, unhappily, too late fully to secure such benefits, yet considering that the railway system is rapidly growing, and admits of indefinite extension, it must be important to secure the maximum of advantage for the future.*

---

* Since the above was in print the Commission received a copy of evidence recently taken by a Select Committee of the House of Commons on the "Tramways (Ireland) Acts Amendment Bill." This evidence is strongly confirmatory of the views I have expressed, not only as regards the importance of constructing branch railways,—employing occasionally an unusually narrow gauge,—but also as to the expediency of transferring to a Government Board those duties relating to railways which now devolve on Parliament. Some of the witnesses recommend that cheap narrow-gauge railways, such as I have called "railroad by-ways," should be made when wanted on the ordinary high roads of Ireland; but the majority of witnesses, including Colonel Yolland and Captain Rich (Railway Inspectors to the Board of Trade), and Sir John Macneill, prefer taking new routes; and all three are of opinion that such lines may be made and worked at a comparatively low cost. Sir John Macneill gives detailed plans and estimates of a line 11 miles long and 3½ feet gauge which he proposes to construct between Downpatrick and Newcastle, at an average cost per mile (including land and rolling stock) of 3,533*l*. Sir John Macneill recommends that on these subsidiary lines there should be no intermediate stations, but that the porters should travel with the train, which, the speed being comparatively low (15 miles an hour) and the train light, should stop whenever

(G.)—Compensation for Injury.—Insurance.

28. [Under this head, I am happy to say, my views accord generally with those of the majority of the Commissioners. Nevertheless, as the case is somewhat differently argued, I have thought it better to retain this portion of my Report.]

On the present arrangements, the company is made liable for accidents and their consequences, whenever it can be shown that culpability attaches to the company or its subordinates; and, by Lord Campbell's Act, the compensation to suffering parties is made to vary according to their respective circumstances; the relict, for instance, of a man earning a large income receiving much, while the relict, say, of a day-labourer receives but little.

Now, while it is plausible that the compensation should thus be in proportion to loss, the operation of the rule leads to serious injustice. It is obvious that all such payments, seeing that they increase the expenses of the company, must consequently tend to augment the fares charged to passengers; and if the rich man's life is treated as in effect more highly insured than that of the poor man, while his payment of fares is, conveniences equal, the same, the poor man must in effect help to pay the insurance of his richer fellow-passengers. Hancock, 7,697–9.

Surely a fairer plan would be that the man whose life is especially valuable should be called upon to pay a proportionate insurance; and all that the company can be bound, in fairness, to do, is to give opportunity for effecting such insurance with all possible facility. Supposing that each man could take out a ticket varying according to his own estimate of the loss that would be entailed by his death, incapacitation, or other injury, and the actual compensation were made proportionate to such rate of insurance, justice would be done to all, every one's risk falling upon himself, and every one's recompence being, as in case of fire, marine accident, or ordinary life insurance, in proportion to his payments. Such an arrangement, therefore, is recommended. Clarke, 12,774. Eborall, 16,233–46.

It is proposed that the ordinary ticket should still enable sufferers to claim compensation from the company to a certain extent; but that without any relation whatever to their income or social position, except so far as it may be indicated by the class in which they travel; the payment in case of death to be a certain fixed multiple of the single mileage fare, say for instance, in the ratio of 100*l.* for a penny; so that the heirs of a passenger killed in travelling at the rate of 1*d.* per mile would receive, independently of insurance, 100*l.*, while those of a fellow-passenger killed in travelling at the rate of 3*d.* a mile would receive 300*l.*; minor injuries being paid for in proportion, and so far as possible according to some fixed scale. Of course the multiple may be fixed higher or lower, as may be desired.

At the same time, as indicated above, the proprietors or lessees of the railway on behalf either of themselves or of some other company (whose payments they should guarantee) should on the usual application grant further insurance, within reasonable prescribed limits, at the discretion of the insurer. Eborall, 16,241–2.

A similar rule should, in fairness, be extended to luggage.

In making these recommendations, however, I do not propose to abolish or in any way to alter the penal sanction now existing in cases of great and wilful misconduct or negligence.

(H.)—Ireland.

29. Whatever objections may exist to the Government purchase of the English and Scotch railways, the case of Ireland is evidently peculiar, the impossibility of continuing the present system being, indeed, distinctly maintained by nearly all the witnesses on the subject, however they might differ as to the mode of relief. The management of most of the lines, (with a few creditable exceptions,) seems to be universally regarded as at once costly and inefficient, the fares and other charges as unnecessarily high, whilst for want of that co-operation now becoming, through amalgamation and other Fox, 6,591. Forbes, 1,813. Ryan, 2,653–710. Cawkwell, 5,069. Clancarty 6331–8.

necessary, as for instance, when crossing any road (the porters opening and closing the gates), and "even at any farm house if they saw a signal." These and other suggestions, made with a view to economy and public convenience, appear to be deserving of the most careful attention in connexion with the arrangements which have been recommended. Sir John Macneill proposes (as suggested above) to carry two classes of passengers only, and recommends rates of 1*d.* and ¼*d.* per mile respectively. He is of opinion that on the line he has proposed, the traffic, which he estimates at only 6*l.* 10*s.* per mile per week, will suffice to defray all expenses and to afford a profit of 5½ per cent. on the capital.

Huish, 16,011–31.

means, so common in England and Scotland, the conveyance of passengers and goods is subjected to much inconvenience and derangement.

Haughton, 4,621–4, 4,717–20. Shaw, 6,385. Jones, 6,463. Fox, 6,572–3. Galt, 8,489–90.

Many of the companies are represented to be in serious pecuniary difficulties, and it is urged that without aid from Government several of the lines must fall into disuse.

The evidence shows the existence in Ireland of a strong desire for the purchase of the railways by Government, and that such desire, if not universal, is very general.

Hemans, 3,907 Mulvaney, 1,176, 1,276. Forbes, 1,553–67. Mallet, 2,238–43, 2,282. Longfield, 2854–60. Malcolmson, 3,449–52. Barrington, 7,166. Galt, 8,485. Appendix BQ. also DC. Bidder, 4,217.

Further, while most of the Irish witnesses are of opinion that, under good management, fares and other charges might be largely reduced, with only temporary loss in profit, many declare themselves willing that any loss so arising should be made good by the Irish nation, either by an increase of income tax, or otherwise; and this declaration has been confirmed by resolutions passed at several public meetings held on the subject.

Lastly, in a recent debate in the House of Commons, (July 20th, 1866,) on a motion by Mr. Gregory, M.P. for Galway, general concurrence in the above views was expressed by both sides of the House.

It should be added, that as the whole railway system of Ireland does not greatly exceed the length of line held by some single companies in England, while the capital invested and the amount of traffic are even less, the purchase of the lines would involve comparatively little risk or responsibility.

It is therefore recommended that the Irish lines should be purchased by Government, as early as practicable, in the manner proposed in para. 10 in respect of railways generally.

Should Government determine on the purchase of the Irish railways, it seems expedient that all such action with regard to the English and Scotch railways (in behalf of which no such demand is made), should be deferred until the result of this first experience be known.

At the same time it will have to be borne in mind, whenever the time for further decision arrives, that the best results to be expected in Ireland are of a very moderate character. The railway system there being now in a very depressed and most unsatisfactory state,—such as even to threaten partial dissolution,—much will be achieved if matters be simply placed upon a sound footing. Considering that the population of the country is actually diminishing, that, save in some important localities, enterprise is but feeble, and the country comparatively poor, no large increase of profit can justly be expected. It must suffice to benefit the public and save railway proprietors,—so far as practicable,—from further depreciation of their property. Indeed it is obvious that the experiment of railway purchase by Government would be tried under very unfavourable circumstances.

Forbes, 17,107. Bidder, 4,217.

But should Government object to purchase even in respect of Ireland, there seems to be no valid alternative, but that it should endeavour to promote the formation of a company for the same purpose, and to obtain for it the same powers and privileges, with necessary exceptions, (the guarantee being of course one, but not so the relief from local taxation,) as I have recommended that Government should exercise, if it took the task upon itself.

To such a company the following advantages also might, I think, with due caution be granted, on condition of their making certain concessions.

The advantages are—

1st. Government loans to a moderate extent, where the security is undoubted, and at a low rate of interest.

2nd. Limitation as to liability for injury, as proposed in the general plan (para. 28).

3rd. Protection from the competition of new lines.

4th. All practicable facilities for the extension of lines, including the purchase of land.

5th. Protection from demands in relation to what is called "sea-risk," the same, however, to be extended to the railways on this side the Channel.

The concessions to be made by the Company in consideration of the above privileges are—

1st. To adopt a comparatively low tariff of charges, whether for passengers or goods; and

2nd. To convey the mails at the rates which I have recommended (para. 23) for adoption in respect of lines which may become National property.

And, as there seems to be no reason why Irish railways should enjoy peculiar privileges, it is recommended that similar advantages, under similar conditions, be offered to any established, responsible, and well-conducted railway in the United Kingdom.

A reference to Mr. Monsell's separate Report will show that while there are important points of difference between us, especially as to the conditions of purchase, we never-

theless agree in recommending that the Irish railways should be dealt with first, and that their purchase by Government should be made with all convenient speed.

(I.)—Safety.

30. The importance of punctuality as a means of safety is too obvious to need enforcement.

The establishment of communication beween the passengers and the guard being, as I believe, still under the consideration of a committee of railway officials—which has instituted a variety of experiments on the subject—I forbear to dwell upon that point, merely observing that any plan not including the means of passage for the guard throughout the train, while in motion, must be very imperfect, often leading to disappointment in the passenger and perplexity in the guard; since to stop the train on the mere requisition of passengers might often involve serious consequences. Gooch, 17,584. Hawkshaw, 14,620–1.

And here it must be observed, that with our prevailing narrow gauge such through passage, though held practicable by one eminent engineer (Mr. Hawkshaw) seems to be regarded as impracticable by railway authorities generally. Hawkshaw, 14,629. Clarke, 12,762–4.

On the Irish lines, however, where the gauge is wider, the arrangement is probably feasible; and this constitutes one reason why the Irish lines should be first dealt with by the Government.

I am of opinion that while no steps should be taken that would withdraw from immediate managers the responsibility of providing for the safety of their passengers, a continuous, regular, and systematic inspection under the authority of Government might be advantageously instituted over all lines, in whatever hands their management may be placed.

At the present time, when a line has once been opened, inspection is confined to cases of accident; and at such times a body of rules is produced, often sufficient, if duly enforced, to attain the desired end; but unfortunately the evidence of such enforcement is generally insufficient; and notable instances have occurred in which it became clear that rules were rather for show than for observance. Now the proposed inspection would certainly accomplish much, if it only served to set the question of enforcement of rules beyond all doubt. It is not recommended, however, that the inspectors should have any further power than that of full examination, and of reporting to the proper department of Government the facts as they found them, feeling sure that simple publicity would be a sufficient corrective to at least habitual negligence. Since the above was written, the views herein expressed have been confirmed by the Report of a Select Committee of the House of Commons, to which attention is drawn in a note at p. cxx. On reference to the evidence of Colonel Yolland, Railway Inspector, (Questions 602–4 and 620–3), it will be seen, that not only the rules laid down by the companies with a view to safety, but even those enacted by Parliament, are habitually neglected, and that even on our principal railways.

In the Appendix BK will be found a paper by Mr. Edwin Hill on this subject, to which I desire to draw attention.

Finally, in connexion with the subject of safety,—it being manifest that any reduction in the fares should never be so sudden and considerable as to cause an increase in the traffic that must tax unduly the means at command,—I recommend that the reductions to be effected by the measures herein proposed be made gradually.

(J.)—Insolvent Companies.

31. Since the appointment of the Commission new difficulties have arisen, and those of a very serious character; several companies having fallen into embarrassment, and at least one into avowed insolvency.

It has therefore become a question how the creditors of such companies, and more especially the holders of debentures and preference shares, are to obtain that payment to which they are entitled without such proceedings as would derange the traffic, if not absolutely stop it.

Two modes of solving the problem have been urged on public attention.

First.—That Government should give aid either by loan or by such guarantee as would enable the companies to borrow on advantageous terms.

Second.—The sale of the property as in ordinary cases of insolvency.

The obvious objection to the first mode is that it calls upon Government to lend on security which ordinary capitalists regard as insufficient.

The objection to the second mode is that sale on fair terms, where the amount of property is so very large, is exceedingly difficult, if not altogether impracticable: seeing that individuals could not bring the required capital into the market, and that companies could scarcely be formed on a merely contingent expectation. So that there would be little or no competition for the purchase.

It appears to me that there is a third expedient free alike from the objection raised against the first and the difficulty attaching to the second.

This is the enactment of a general law, by which when a Railway Company becomes insolvent—such insolvency being declared by the Court of Chancery or other competent tribunal—the management of its affairs should be transferred from the ordinary shareholders to the holders of preference shares and debentures; who, taking upon themselves all responsibilities attaching to their predecessors, should be empowered forthwith to elect a new body of Directors.

By this means the power would be withdrawn from those who have but at most a contingent and probably slight interest in the good management of the line, and given to those whose interest has become direct and important.

Under this arrangement the public convenience would at worst remain unaffected, and the ordinary shareholders would retain in full their present claim to any surplus proceeding from improved management or otherwise.

I therefore recommend that this third course should be adopted in cases of Railway insolvency.

(K.)—Summary of Principal Conclusions.

Beneficial Effects of Railways. (pars. 2 to 4.)

32. That while railways have notoriously conferred enormous benefits on the public, at the same time greatly enhancing the value of land and other fixed property, the general result to those whose capital and energy have produced this beneficial change has been unsatisfactory, and too often disastrous. Further, that with every allowance for bad management in the companies themselves, much of this loss must be attributed to erroneous legislation.

Why Railways should belong to Government.—Competition. (pars. 5 to 15.)

(1.) That the formation of competing lines, while not producing, but rather preventing permanent reduction of rates, has grievously injured the interests of existing companies, and tended to check the useful extension of lines, and other improvements.

(2.) That railways, being shown by experience to be essentially monopolies, cannot be advantageously left to independent companies; but should be in the hands of those who are charged with the interests of the country at large, viz., the Government.

(3.) That, nevertheless, Government should not itself attempt the immediate management of the lines, but should lease them to companies or individuals, though retaining the power to enforce the observance of all regulations necessary for public safety and convenience.

(4.) That the State should, therefore, gradually purchase the whole railway system, with the exception perhaps of a few lines, on terms to be agreed upon with the several companies.

(5.) That such purchase does not necessarily involve any outlay on the part of Government, seeing that the transfer may be made on such arrangements as are generally adopted when a line is transferred from one company to another, so that no increase of the National Debt is implied.

(6.) That while the rent demanded for a line must be sufficient to cover the payments by Government in dividends, interest, &c. to the previous owners, preference amongst competent applicants should be given to the one who offers to adopt the lowest tariff of charges.

(7.) That Government purchase of railways may be expected to secure the following advantages: viz.

A. A pecuniary gain to the State.
B. A gain to shareholders and others in steadiness and security of income.
C. Security against Parliamentary contests, now so costly.
D. A reduction (eventually large) in fares, freights, &c.
E. Greater efficiency of management.
F. Increased postal facilities.

(8.) That the department of Government intrusted with the duties arising out of the proposed plan should be empowered, under proper limitations, to authorize the construction of new lines.

(9.) That the head of the department should be a permanent officer, selected with exclusive reference to fitness for the post, and should have the full powers necessary to complete responsibility.

(10.) That the lessees should have the unrestricted appointment and dismissal of all their subordinates.

The Post Office. (pars. 21 to 24.)

(11.) That the laws regulating the relations between the railways and the Post Office are at present in a state unsatisfactory to both parties, productive of much inconvenience to the public, and require to be changed.

(12.) That, amongst other improvements, tariffs of charges should be established, as opportunities arise, for the conveyence of mails, based generally upon the rates of charge which the companies make to the public. Such tariffs will be found at pp. 10, 11 of this Report.

(13.) That, as public convenience would be greatly served by the establishment of a small parcel post at a uniform rate, this should be effected as fast as lines are purchased by Government or the concurrence of the existing companies can be obtained on reasonable terms.

Extension of Railways. (pars. 25 to 27.)

(14.) That most lines yet to be constructed will be of the nature of by-ways.

(15.) That, by applying to the construction of these lines, principles already applied to common by-ways and to the draining of fens in this country, and recently to branch railways in France, the necessary outlay may be provided for without injury to any one, and thus the extension of the railway system exceedingly facilitated, and the fares and freights on such lines fixed at probably less than half the ordinary rate.

(16.) That experience abroad has shown, that where ordinary lines would be too expensive for the traffic, it is expedient to construct single lines of very narrow gauge.

(17.) That the extensive ramification of the railway system which would be effected by adopting the above means, combined with other economical arrangements specified in this report—an extension probably exceeding in the aggregate the whole length of line now in existence—would not only greatly facilitate conveyance within the district served, but would extend the means of general intercourse beyond calculation, and by the influx of traffic so thrown into the general system, would lead to a reduction of the rates on the present lines.

Compensation for Injury.—Insurance. (par. 28.)

(18.) That the present rule of compensation for injury to person is unjust in practice; seeing that, in effect, it compels the poor to pay part of the insurance for the rich.

(19.) That the just rule would be that, while still calling on the company to make compensation for injury to a certain extent, any one desiring to secure higher compensation should be expected to insure accordingly, every facility being afforded for the purpose.

(20.) That, nevertheless, the penal sanction now existing in case of great and wilful misconduct, should remain unaltered.

Ireland. (par. 29.)

(21.) That as regards the Irish railways, considering that there exists at present general dissatisfaction as to their management; that several of them are in such difficulties as to render even their continued working uncertain; considering, also, that there exists in Ireland a general desire for their purchase by Government, together with a willingness to guarantee the State against loss by such purchase; and considering, lastly, the limited extent of the whole system, it is desirable that the Irish lines be purchased as a first experiment; this to be done in the manner proposed for the purchase of railways generally.

(22.) That, failing the adoption of this measure, Government should promote the forma- of a company for attaining the same end, such company to have privileges similar, for the most part, to those which Government itself would exercise in like position, but that in return for such privileges, certain concessions should be required on behalf of the public.

Safety. (par. 30.)

(23.) That while nothing should be done that would impair the just responsibility of companies for the safety of their passengers, it is highly desirable that the Government inspection, now exercised only at the opening of a new line, or in case of accident, should be continuous, regular, and systematic.

Insolvent Companies. (par. 31.)

(24.) That in case of insolvency the management of the company's affairs should be transferred from the ordinary shareholders to the holders of preference shares and debentures.

All which I submit to Your Majesty with great humility.

MINUTES OF EVIDENCE

TAKEN BEFORE

THE COMMISSION.

Thursday, 23rd March 1865.

PRESENT :

THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
THE RIGHT HON. ROBERT LOWE, M.P.
SIR ROWLAND HILL, K.C.B., F.R.S.
J. A. ROEBUCK, ESQ., M.P.
T. B. HORSFALL, ESQ., M.P.
ROBERT DALGLISH, ESQ., M.P.
GEO. CARR GLYN, ESQ., M.P.
A. S. AYRTON, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., F.R.S.
E. T. HAMILTON, ESQ.
J. R. M'CLEAN, ESQ., PRES. INST., C.E.
WM. POLE, ESQ., F.R.S., *Secretary.*

HIS GRACE THE DUKE OF DEVONSHIRE IN THE CHAIR.

Mr. CHARLES CLARK examined.

1. (*Mr. Horsfall.*) You are a merchant extensively engaged in business at Liverpool ?—I am.

2. You are Chairman of the Railway Committee of the Liverpool Chamber of Commerce I believe ?—Yes, I am.

3. Have very great complaints been made to the Chamber of Commerce of the existing excessive railway charges on traffic to and from Liverpool as compared with other places ?—Yes; we have had frequent complaints both of the excessive charges, that is, charges in excess of the charges made for carrying the same goods similar distances from other ports; and we have also had complaints made of the want of sufficient accommodation on the part of railway companies for the accommodation of the Liverpool traffic.

4. Have you drawn up any statement showing several of those inequalities ?—Yes, we have done so. We sent out a series of queries to gentlemen engaged in various branches of trade, and I hold several of them in my hand. This is a table asking them to give us the rates from Liverpool to various places with the rate of carriage per ton, the distance carried, and the rate per ton per mile, upon various classes of goods, and the same information as to the carriage of the same goods to the same places from other ports. A large number of those tables has been sent in. I have here got a tabulated statement of the general result. This of course is an average so far as we can go, and it represents the charges actually paid by the gentlemen who have sent in those returns. I have three tabulated statements, one showing the charges upon timber and deals from Liverpool as compared with other places to a large number of towns. I have another statement showing the charges upon manufactured chemical articles from Liverpool and other places respectively; another showing the charges upon sugar and other heavy goods of a similar class, also from Liverpool and other places respectively. (*For these three statements, see Appendix A.*)

5. Are they founded on the returns made by the traders ?—Yes; they are founded on the returns made by gentlemen engaged in those trades, and who have actually paid the rates here set down.

6. Will you describe to the Commission some of the inequalities ?—I may say that the general result of these tables, which I will put in, is that the rates from Liverpool to certain places in the interior are in many cases from 20 to 30 per cent. in excess of the rates charged from other ports at the same distance from the place of consumption for the same goods; and as regards the rates per mile, if you take them from Liverpool to the places of consumption, and contrast them with the rates per mile from other ports to the same places of consumption you will find that the mileage rate is in some cases 50 per cent. in excess, and even over in one or two instances. Take, for instance, the article of chemicals. The rate for carrying chemicals from Liverpool to Hull, a distance of about 130 miles, is 15*s.* per ton, and the rate for carrying the same goods from Newcastle-upon-Tyne to Hull, which is about the same distance, is 8*s.* The rate per mile from Liverpool to Hull is 1*d.* and $\frac{38}{100}$ths of a penny per ton; the rate per mile from Newcastle-upon-Tyne to Hull for the same goods is $\frac{73}{100}$ths of a penny per ton. I will give another case still on the same article. The rate from Liverpool to Leeds, a distance of 74 miles, is 15*s.* per ton. The rate from Newcastle-upon-Tyne to Leeds, a distance of 98 miles, is 13*s.* 4*d.*, per ton. The mileage rate from Liverpool to Leeds is 2*d.* and $\frac{43}{100}$ths of a penny per ton; the mileage rate from Newcastle-upon-Tyne, upon the same goods is 1*d.* and $\frac{23}{100}$ths of a penny: and those two places actively compete with each other for this class of trade. And it is precisely the same as to Wakefield. The rate from Liverpool to Wakefield, 71 miles, is 15*s.*, and the rate from Newcastle-upon-Tyne to Wakefield, 125 miles, is 13*s.* 4*d.* The mileage rate from Liverpool is 2*d.* and $\frac{53}{100}$ths. of a penny per ton; and the mileage rate from Newcastle-upon-Tyne is 1*d.* and $\frac{28}{100}$ths of a penny. There it is as nearly as possible 100 per cent. more. That is as to chemicals alone, As to timber, take the rate from Liverpool to Penistone, a distance of 63 miles and a half, the rate is 16*s.* per ton. From Hull to Penistone, a distance of 80 miles, the rate is 10*s.* 11*d.* per ton. The mileage rate from Liverpool is 3*d.* and the 42nd part of a penny per ton; the mileage rate from Hull is $1\frac{1}{2}$*d.* per ton per mile. Take the rate to Preston from Liverpool, a distance of 32 miles, the rate is 6*s.* 3*d.*; from Fleetwood to Preston, a distance of 20 miles, the rate 2*s.* 2*d.* The mileage rate from Liverpool is 2*d.* and a third; and the mileage rate from Fleetwood is 1*d.* and $\frac{3}{10}$ths.* And that is more remarkable because the distance is shorter, and one would naturally expect the rate per mile to be higher. There are many instances of the same kind.

* The rate on timber from Fleetwood to Preston has been raised, and now stands at 3*s.* 4*d.* per ton.

Mr. C. Clark.
23 March 1865.

7. (*Chairman.*) There was a third class of goods which you mentioned?—Yes, sugar From Liverpool to Sheffield, about 73 miles, the rate on sugar is 20*s.* per ton. From Hull to Sheffield, 76 miles, it is 13*s.* 4*d.* The mileage rate from Liverpool is 3¼*d.* per ton, as compared with the mileage rate from Hull of 2*d.* per ton a mile, very nearly the same distance. Take again, for instance, from Liverpool to Burton, a distance of 90 miles, the rate is 19*s.* 2*d.* From Bristol to Burton, 124 miles, the rate is 19*s.* 7*d.* The mileage rate from Liverpool is 2*d.* and ⅝ths of a penny, as compared with the mileage rate from Bristol of 1*d.* and $\frac{9}{10}$ths. of a penny. From the same towns to Bradford, for instance, from Liverpool to Bradford, a distance of 73½ miles, the rate is 17*s.* 6*d.* From Bristol to Bradford, 221 miles, the rate is 26*s.* 3*d.* The mileage rate from Liverpool is 2*d.* and ⅚ths of a penny per ton, as compared with the rate from Bristol of a 1*d.* and ⅓rd of a penny per ton. Precisely the same thing applies to Sheffield.

8. (*Mr. Horsfall.*) Are those the rates after making allowance for the terminal charges?—The terminal charges in each case are included, those are the actual rates of the carriage paid; but the rates are largely in excess from Liverpool, making an allowance for the terminal charges.

9. (*Mr. Roebuck.*) Can you state to the Commission the names of the several railway companies which make those different charges?—The charges of all the railways coming into Liverpool are uniform, they have a combination amongst them, and they all agree to charge the same rate.

10. I am talking of the different places that you have cited, there being different charges made at the different places. Can you point out the different railway companies which make those different charges?—I do not see how it is possible to do so, as the goods going from Liverpool to any one of those places may possibly pass over the lines of three or four different companies.

11. (*Mr. Glyn.*) The charge, I believe, is one through charge?—Yes, it is.

12. (*Mr. Roebuck.*) The charge from Newcastle to Sheffield is one through charge, but most of the traffic goes by different railways?—Yes.

13. There are various railways from Newcastle to Sheffield, are there not?—There may be; I am not aware whether the railway from Newcastle to Sheffield belongs to one company.

14. That is not the same railway that goes from Liverpool to Sheffield?—Possibly not.

15. (*Mr. Glyn.*) With regard to the traders in Liverpool they would not be affected by that question?—Not in the least, it does not matter what railway makes the charge, it is one through rate.

16. (*Mr. Roebuck.*) Are those different charges made by the same railway?—In some cases they are. With regard to Preston and Fleetwood, which is perhaps one of the worst cases I have, showing the greatest excess, an enormous difference exists upon the line of the same company.

17. (*Mr. Glyn.*) What company is that?—The London and North-western Company.

18. As to the route between Liverpool and Preston, there is great competition, is there not? There are several lines?—Yes; but there is no competition between them, and they all charge the same rate.

19. (*Lord Stanley.*) There are not only several lines, but several distinct companies, are there not?—There are two.

20. (*Mr. Glyn.*) Between Fleetwood and Preston there is only one company I believe?—Between Fleetwood and Preston there is only one line, but I think that two companies have an interest in it.

21. That is to say they rent it jointly?—I cannot say.

22. It is worked by one company, is it not?—That I cannot tell you. I believe it is worked by an arrangement amongst the companies there.

23. (*Mr. Lowe.*) You say that companies running out of Liverpool charge a uniform price, and that that is higher than the price charged by other companies?—I mean that the companies running out of Liverpool to a given place agree to charge the same rate amongst themselves.

24. The rate being a higher one?—That rate generally being in excess, for the distance carried, of the rate that is charged by other companies from other places, as much as from 20 to 50 per cent. in many cases.

25. (*Sir R. Hill.*) Are there any cases in which the charges to and from Liverpool are less than the charges to and from other towns?—The table which I hold in my hand relates to sugar and sundries. There is only one single case in which the mileage from any port is in excess of the mileage rate from Liverpool, out of I suppose 50 or 100 cases, and that is from the port of London. From the port of London to Stourbridge, for example, the rate appears to be 2*d.* and ⅐th. From Liverpool to Stourbridge the rate is 2*d.*

26. (*Mr. Glyn.*) On sugar?—Yes. Then from Liverpool to Wolverhampton the mileage rate is 2*d.* From Bristol to Wolverhampton the mileage rate is 2*d.* and $\frac{2}{10}$ths of a penny. Those are the only two cases in this table in which the difference is in favour of Liverpool as compared with other ports.

27. Those are the charges made by two different companies; one by the London and North-western Company, and the other by the Midland Company?—Does your question refer to from Bristol to Wolverhampton?

28. Yes?—In all probability those are the charges made by different companies.

29. (*Chairman.*) The greater part of the instances that you gave before had reference to different companies?—Yes.

30. (*Mr. Glyn.*) When you made a comparison as to the chemicals, was that done as between Liverpool and certain places in Yorkshire, because if you make a comparison as between Newcastle-upon-Tyne and Yorkshire there will be distinct companies?—Yes; in the majority of cases.

31. (*Mr. Horsfall.*) In each case the rate is largely in excess, is it not?—Yes.

32. The inequalities of which you have spoken press, I presume, upon those goods whose weight is out of proportion to their value?—Yes; upon all classes of heavy goods the difference in the rate of carriage presses with extreme severity, because in those cases the cost of transit is one of the most material elements in the cost to the consumer in the interior, and, therefore, the difference of 10, or 20, or 30 per cent. in the cost of transit is frequently much more than the entire amount of the profit upon the transaction.

33. In some cases is it not the fact that those heavy rates prevent the development of trade, so far as regards Liverpool?—Undoubtedly in many cases. Many cases have occurred in which business would have been done, where produce has been lying in Liverpool which would have been purchased, but produce has been bought in other ports in some cases at a higher rate, in consequence of the difference in the cost of carriage, where the distance from the place of consumption to the respective ports was as nearly the same as possible.

34. I believe that the trade of Liverpool is chiefly a transit trade?—Yes.

35. Can you state to the Commissioners what was the total tonnage inwards and outwards at Liverpool in the year 1864?—The return of the collector of customs at Liverpool of the tonnage of Liverpool during the year 1864, shows a total of vessels entered inwards and outwards of 9,640, and a total tonnage of 5,351,456 tons.

36. Are you prepared to state the total declared value of the British and Irish produce and manufactures exported from the port of Liverpool in the year 1863?—I find, from the last published return of the Board of Trade, that the total value of the British

and Irish exports from the port of Liverpool for the year 1863 was 64,789,266*l.*, which is a sum largely in excess of the corresponding exports from all the other ports of England put together, including London. One of the tables I shall put in will show that. (*See Appendix B.*)

37. (*Mr. Glyn.*) Can you give the same quantities for the preceding year?—No. I have merely taken these for the last year.

38. (*Mr. Horsfall.*) Is it not the fact that the traffic to and from Liverpool has become so enormous as to be in excess of the accommodation provided by the whole of the railway companies?—It is so, and especially at times when there is a large import of grain coincident with a large import of cotton. Whenever we have large importations of food into Liverpool, and large importations of cotton, the amount of the traffic passing from Liverpool into the interior is so great that the railway companies find the utmost possible difficulty, with their present means of accommodation, in conveying it, and the consequence is, that it imposes upon the traders in Liverpool very considerable loss and inconvenience.

39. (*Mr. Glyn.*) How many railway companies have termini in Liverpool, which are ready to do the work?—I presume there are three, although there may be more, that have an interest in them. There is the London and North-western Company, the Lancashire and Yorkshire Railway Company, and the Great Northern Railway Company. They have a terminus at the south end of Liverpool, it can scarcely be said to be brought into the town.

40. Do not more companies besides those three collect goods in Liverpool?—I think not, or if they do so, they do it through the agency of those three companies.

41. (*Lord Stanley.*) You do not appear to take into account the Great Western Company with its communication to Birkenhead and thence across?—No. In speaking of Liverpool, I am thinking of the Liverpool shore only. If you take into account the Birkenhead traffic, the Great Western Company of course comes into Birkenhead.

42. (*Mr. Glyn.*) Referring to the last question, do not the Manchester and Sheffield Company, as well as the Great Western Company collect goods, and have their agents in Liverpool?—They may have their agents, but they have themselves no line coming into Liverpool. If they carry from Liverpool, they must carry over the lines of the other companies.

43. But I presume that their stock comes to Liverpool to take away those goods?—No doubt it does so, but it comes over the lines of the other companies, they have no terminus of their own, no independent line of their own at Liverpool.

44. (*Mr. Horsfall.*) Had the railway accommodation been greater, and the rates equal from Liverpool to what they are from other ports, have you any doubt that the transit through Liverpool would have been larger than it is at present?—I have not the slightest doubt. Many cases frequently occur, of goods being diverted from Liverpool, which would have come to it, and the trade passing away elsewhere that would have passed through Liverpool in consequence of these rates.

45. That is particularly so, is it not, as to the salt trade?—It is. I have a letter here from a gentleman who is the chairman of the Salt Chamber of Commerce at Liverpool, Mr. Falk, he says, "That one "of the most important trades of Liverpool as regards "bulk, is the salt trade export amounting to upwards "of 800,000 tons in the aggregate: That it is "almost the parent of the port inasmuch as being "a primary necessity of life, it drew, in more remote "times, ships to the port who in exchange brought "produce to barter against salt: That railways have "never given any facility of carriage or accommodation "for loading of ships at Liverpool, although other "ports, Gloucester, Grimsby, Hull, have been extensively accommodated for salt traffic: That the consequence is an entire absence of competition with the "only channel of transit which brings salt to Liverpool, the river Weaver: That the rates of carriage "and dues levied by the Weaver navigation have therefore remained the same for a century past: That the "price of salt is 4*s.* per ton, at the works in Cheshire, "and the rate of carriage and Weaver dues the same, "4*s.*: That the London and North-western Railway "passes through the works at Winsford, 35 miles "distant from Liverpool, but takes no salt traffic to "Liverpool from reasons aforenamed: That the "rate of carriage for salt to Grimsby, 144 miles "distant, is only 6*s.* per ton; Hull the same: That "in consequence nearly the entire Baltic trade has "left Liverpool, and along with it the return import "trade of timber and other raw produce to the great "detriment of Liverpool and its merchants."

Mr. C. Clark.
23 March 1865

46. (*Mr. Roebuck.*) In the letter it is stated that the Baltic trade has left Liverpool, as compared with the ports on the eastern side of the island. Does not the difference between the east and the west make a difference in the traffic to the Baltic?—No doubt it does. There can be no doubt whatever that the proximity of the eastern ports to the Baltic, would naturally draw to those ports a greater proportion of that trade. But I understand the statement of Mr. Falk to be this, that if 4*s.* are charged for carrying salt about 20 miles to Liverpool, and the same salt is carried 144 miles, I think for 6*s.*, that that is a very material disadvantage to the shippers in Liverpool as compared with the shippers in the eastern ports. The difference of sea carriage is a natural disadvantage which they have to contend against in reference to which they must do their best, but the other is an artificial disadvantage which is created to their prejudice.

47. (*Mr. Dalglish.*) Has the trade in salt in Liverpool suffered very much from another cause, namely, the doing away with the chemical works which use a great deal of salt?—I cannot answer that question, I am not familiar with the salt trade. This statement rests entirely upon the authority of the chairman of the Salt Chamber of Commerce and must be taken for what it is worth.

48. (*Mr. Horsfall.*) Have you had similar complaints made as to the coal trade?—Yes. I have here a letter, received from a gentleman who is largely engaged in that trade, complaining of the want of accommodation. This is addressed to the President of the Liverpool Chamber of Commerce, and he says: "As your Chamber has taken into consideration the "matter of railway grievances relating to the excessive rates of carriage to and from Liverpool, allow "me to put before you a short account of those "grievances which are suffered by the coal trade at "Crown Street, owing to the inadequacy of the "accommodation, which has not for a long time "(with very trifling exceptions) been materially "extended. The immense traffic which is brought "into Crown Street, including coal, and minerals, "and agricultural produce, is all carried from the "main line through a tunnel, which has only one line "of rails. The monthly total tonnage is from "40,000 to 50,000, and when it is taken into consideration that there is only the single line of rails "through the tunnel for this traffic to pass over, "and also that the yard accommodation is extremely "small, it will easily be perceived that the increased "business of the last two or three years has taxed "to the utmost the power of the London and North-western Railway Company to provide for it, and "their incapacity to do so properly has entailed "heavy loss upon the coal trade, by the excessive detention to which waggons are subjected. Waggons "which used to average one journey per day to the "collieries at St. Helens, Wigan, &c. &c., are now "usually from three or four days to a week, and "frequently more than a fortnight on the line; the "consequence of which is that colliery proprietors "would rather send a waggon to London than to "Crown Street station. A few months ago a letter "signed by the firm was sent to the chairman of the

Mr. C. Clark.
23 March 1865.

"company, in which full particulars were given of "the existing state of affairs, and suggestions made "that the company should extend their accommoda- "tion by the purchase of Parliament fields or other "land in the vicinity. After this a memorial, much "to the same effect, signed by most of the coal pro- "prietors and merchants at Crown Street, was sent "to the company, to both of which answers were "received, saying that the directors would give the "subject their best attention. The effects of this "grievance will be felt by this town in several ways: "Firstly, by part of the trade in coals which would "otherwise be sent here being diverted to other "parts of the kingdom; and, secondly, by the fact "that the loss which is at present sustained by "individuals will ultimately fall upon the public in "the shape of a corresponding increase in price to "the consumers."

49. (*Mr. Glyn.*) Are you aware that the London and North-western Railway Company are now applying to Parliament for increased powers to enable them to provide additional accommodation?—Yes.

50. (*Mr. Horsfall.*) Are you prepared to make a statement to the Commission as to the diversion of trade as between Liverpool and France?—There is a very large amount of business carried on between the manufacturing districts in Yorkshire and Lancashire and the various ports in France. Some five years ago, or more, when that business was very much smaller, and prior to the making of the French treaty, a certain part of that traffic passed through the port of Liverpool. I have had an opportunity of inspecting the cargo books of the company owning the principal line of steamers running from Liverpool to the French ports, and I find that at the present time there is actually a smaller amount of manufactured goods carried through Liverpool to France than was the case five years ago, before the development of the French trade, although that trade has increased, I suppose, four or five fold. That would certainly point to a diversion of the trade, and that diversion I attribute to the fact of the excessive charges that are made; for a man will not send his goods to Liverpool if he finds that he can ship them from another port at a lower rate.

51. (*Lord Stanley.*) Are you putting it solely on the ground of cost, or upon that other ground of complaint which, I understand, has been raised, viz., the delay which is caused in consequence of there not being sufficient accommodation upon the line?—In this particular instance I put it upon the ground of the cost. There is no doubt that the element of delay enters very largely into the case; for there is no doubt that if a man, sending his goods to Liverpool, finds that he incurs detention of two or three days, whereas by sending them to another port he can get them shipped more speedily, that of course very materially affects the question.

52. (*Mr. Roebuck.*) The element of cost that you are speaking of is the cost arising out of the railway charges and nothing else, is it not?—Nothing else.

53. There may be other charges which enter into the question which may cause a diversion of the trade?—Yes; but what I speak now of is the question of comparative cost of transit from the places of production to the various ports of shipment.

54. (*Capt. Galton.*) Is not your main argument this, that there is a want of accommodation at Liverpool for the large amount of traffic which is concentrated there?—Certainly not. That is by no means the main argument. The main case is that we are charged vastly in excess for carrying the traffic than is charged for the same traffic to other places.

55. Is not that the result of there not being a sufficient amount of railway accommodation for the wants of the place, and is it not an ordinary question of supply and demand, the railway companies having their lines filled with traffic to the utmost extent, which enables them to demand from you higher rates than other railway companies would, because their lines are not so crowded with trade?—There is no doubt that the fact of the railway companies whose lines come into Liverpool, having a very large amount of traffic at the existing high rates, does induce them to continue those rates, although, at the same time, they may be charging much lower rates for performing the same duties elsewhere; and not only this, but it keeps them in funds, and enables them to perform services which otherwise they might be indisposed to perform.

56. Does not the large traffic completely fill their lines with trade, so that they could not carry more, even though they reduced the rates?—I do not go the length of saying that; but at certain times, under the circumstances I have named, when we have large imports of those two great staples of commerce, then no doubt the railway companies have as much to do as they can do with their existing means of accommodation. But if they were to give us increased accommodation, they could carry a vast deal more.

57. I suppose you could scarcely call upon a railway company to expend a large amount of extra money in order to meet the public necessities, although other people might come into the market?—I do not know, but I may mention this; at the present time we have just the same rails that we had several years ago, when the traffic was much less, and if the traffic, as between Liverpool and Manchester, has doubled, why should not the railway company double their accommodation?

58. (*Mr. Glyn.*) You would say that there are plenty of means of working the traffic, if they had station accommodation sufficiently large, that is to say the lines would do the work?—I do not know that. I think that the lines in Liverpool have already as much work to do as they can ordinarily perform, and that what they want is increased accommodation, not only as to the station, but also the lines, as between Liverpool and Manchester.

59. (*Mr. Horsfall.*) Are you aware of any special reasons why the traffic to Liverpool should be subject to higher rates than to any other port?—No; and not only do I not know of any special reasons, but I think there are very strong reasons why the traffic to and from Liverpool should be charged at *lower* rates. I think that the cost to the railway company, of carrying traffic, depends in the first place upon the outlay of capital involved in the construction, and in the next upon the amount of traffic which is carried over the line. If you have a line which is fully occupied with traffic, as the line from Liverpool is, where the whole capital is in constant reproductive use, I think that the cost of conveying the traffic is reduced to a minimum, and that that is a reason why we should be charged something less, and not anything in excess.

60. (*Mr. Roebuck.*) I suppose that the railway charges are more than you think they ought to be, because the companies find it more profitable?—No, the railway company charges us more, because we are in their power, and we cannot help ourselves, because they have a monopoly. If we could send our goods in any other way, we should very soon find a remedy; but now we have no option, we must send our goods over their line.

61. (*Mr. Glyn.*) There is a great deal of water competition, is there not?—Not at all. You may send goods by the canal, but they are sure to charge the same rate.

62. You do not mean to say, I presume, that there is any combination between the Trustees of the Bridgewater Canal and the railway companies?—I do. I believe that there is an arrangement between them, that they shall not reduce their rates, and I think we had a communication from the chairman of the Liverpool and Manchester Railway, stating (it is some time ago, when we brought this matter before him, and I am speaking from memory) that they would be willing to make some reduction in the rates, but that they were under an arrangement with the Bridgewater Trustees not to reduce their rates below a certain point.

63. (*Capt. Galton.*) Are there not two lines of railway belonging to two companies which lead from Liverpool to Leeds?—I think it is one, the Lancashire and Yorkshire Company have a line to Leeds.

64. And the London and North-western Company?—I do not know that.

65. Are there not two companies from Liverpool to Hull?—The line that carries the traffic to Hull, is the Manchester, Sheffield and Lincolnshire line I think.

66. To Wakefield there are either two or three; but in the instance that you gave, from Newcastle to Leeds, there is only one line, in the hands of one company, so that the people at Newcastle are more in the power of the North-eastern Company than the Liverpool people are in the power of the London and North-western Company?—Practically at Liverpool we deal with but one company. Suppose, for example, that there are three, or whatever the number may be, they have one fixed tariff, so that practically we deal with but one company. We cannot go to one company and say what will you take our goods for, and then go to another company and ask them what they will carry them for, because they all charge the same.

67. (*Mr. Horsfall.*) What you mean is, that if there were a dozen railway companies, so long as such a combination exists, no better terms can be made?—I do not go so far as to say that, because, if there were a dozen companies, the probability is that the combination would break down; but, so long as it existed, we should remain in the same position as to the rates, although we might get an increased amount of accommodation in the transit. I can give the Commission a very striking instance of the way in which this trade is frequently diverted. I have a letter here, which I received from a gentleman who is a very large shipowner, and a member of the Mersey Dock and Harbour Board. It is a private letter, from which I will read an extract. He says, "The Staveley Iron-works Company had a large "quantity of railway material to send out to *India*, "and my firm made proposals for its conveyance "*from Liverpool*, which arrangement would pro- "bably have been carried into effect; but on looking "into the comparative cost of railway carriage to "London and Liverpool, it was found that the goods "would be sent to the former place for 3*s.* per ton *less* "than the latter, while the distances are respectively, "*in round numbers*, *170* miles from Staveley to "London, and only *70 miles* from same place to "Liverpool." Upon an article like iron, of course that decided the question, and the goods were shipped from London and not from Liverpool.

68. (*Mr. Glyn.*) Would not the question of freight by a vessel, after all, determine the question in a voyage to India?—As regards the freight, the freight I think, generally, from Liverpool, as between India and England, is nearly the same as from London, and the homeward freight is generally lower from Bombay to Liverpool than from Bombay to London. So far as regards the sea freight, I think the two ports stand upon a footing almost of entire equality.

69. Are not heavy goods taken at a little lower rate outwards from London?—Possibly they may be. I know that seeds and heavy goods are brought from Bombay to Liverpool cheaper than to London, but outwards that may not be the case. I apprehend that practically there is but little difference.

70. (*Chairman.*) Are these grievances and disadvantages of which you complain of long standing?—Yes; I think it is 10 or 12 years since these complaints have been pouring in upon us.

71. Do you consider that during all that time the rates from Liverpool have been exceptionally high as compared with the rates from other ports?—I think they have. I have not gone so far back as 10 or 12 years ago; but about that time we had complaints from the traders of these exceptional charges, and there have been from time to time certain reductions made.

72. Did not the railway companies come gradually into Liverpool, and was not the trade for a long time solely in the hands of the London and North-western Company?—Yes.

73. As soon as any other railway company got there did they immediately come to an arrangement with one another, or was there a competition for a short period of time?—Yes.

74. Were the rates much lower at that time?—Yes.

75. (*Mr. Glyn.*) Between what lines did the competition exist?—There was a competition in the carriage of goods from Liverpool to Manchester, and I think there was a very keen competition for some time between the lines running to Shrewsbury, between the London and North-western Company, and the Great Western Company to Shrewsbury; there was also a very keen competition to Manchester and back, but it lasted a very short time.

76. Was not the Lancashire and Yorkshire line between Manchester and Liverpool before the London and North-western Company's line was there. I mean before the amalgamation?—I am speaking of the old Liverpool and Manchester line, which ran from Liverpool to Manchester, under whatever name it might be called, and it is the same line now.

77. (*Mr. Horsfall.*) Speaking of those two lines, the old Liverpool and Manchester line, and the London and North-western Company's line now, is there not a prevailing opinion in the Chamber of Commerce at Liverpool, that the London and North-western Company, do not adhere to the principle contained in the Act of 1826?—Yes; there is that opinion undoubtedly. In the original Act, under which the line was first made between Liverpool and Manchester, there was a proviso, or I should say first that there were certain maximum rates granted in the first instance as the rates which the companies might take for carrying goods between Manchester and Liverpool, and then there was a proviso, that if the company should ever divide more than 10 per cent., for every pound so divided in excess, they should reduce the traffic rates to the extent of 5 per cent. I am sure that the Commissioners will be surprised to hear that the maximum rates fixed 39 years ago (in 1826), at a time when the trade was less than one-fourth of what it is now, are in some cases the identical rates which are charged at this day for the conveyance of goods between Liverpool and Manchester.

78. (*Sir R. Hill.*) Are those rates or tolls?—Rates. They are called "Rates for carriage." Take the article of sugar for instance, for all "sugar, corn, "grain, and flour," &c., "not exceeding 9*s.* per ton." That was the rate to be charged between Liverpool and Manchester, and the company were to carry goods from Manchester to Liverpool for that sum. They are not tolls. There is a separate schedule for tolls. But that rate of 9*s.* per ton is at the present time charged for carrying sugar from Liverpool to Manchester. The rate for carrying corn from Liverpool to Manchester, up to within the last two or three months, and until we agitated this question, was 8*s.* 4*d.* They have now reduced it to 6*s.* 8*d.* upon certain conditions. But the Commissioners will see that those maximum rates that were charged 40 years ago, are in some cases the identical rates which are now charged. When those rates were fixed, the total tonnage of Liverpool was about 1,200,000 tons, it is now 5,000,000 tons.

79. (*Mr. Roebuck.*) Will you explain how there has been a deviation from the Act of 1826?—The intention of that Act clearly was that a portion of the earnings upon this line between Liverpool and Manchester over 10 per cent. should go in reduction of the charges levied on the public. Our contention is that the earnings upon that line are far over 10 per cent.

80. Do they divide a dividend beyond that?—No, but they spread the earnings over the entire system.

81. (*Mr. Horsfall.*) That is to say over those lines which do not pay as well as those which do?—Yes; over those which do not pay one per cent. So that

Mr. C. Clark.
23 March 1865.

the advantage which the Legislature intended that Liverpool and Manchester should get from any earnings upon this line in excess of 10 per cent. is completely lost, and not only so, but if it was carried into effect we should have lower rates as between Manchester and Liverpool than exist between any two towns in England; because I believe that there are no two towns in England between which there is the same amount of traffic. For if Liverpool exports 64,000,000 of manufactured produce, whereas all the other towns put together do not export 60,000,000, it follows that the traffic into Liverpool must be enormous in extent. If this limitation were now practically carried into effect, we should have lower rates between Liverpool and Manchester than anywhere else. We do not get that advantage, but we are on the contrary charged a great deal more.

82. (*Sir R. Hill.*) Do you say that those limitations are still in operation?—I speak with deference in the presence of gentlemen acquainted with the law, but I have a copy of the Act of Amalgamation of the Liverpool and Manchester Company with the Grand Junction Company, and I find that all the rights and privileges conferred upon the public by this are expressly reserved. (*See Extracts from the Act in Appendix B.**)

83. (*Capt. Galton.*) If that is so, have you not got it in your own power to enforce it?—Certainly not; at least I think not. The wording of the Act is, that the Directors shall reduce the rates 5 per cent. for every one pound of dividend which they divide beyond 10 per cent. Now the Directors have never divided more. I have a list of the dividends that they have divided. Before the passing of the Amalgamation Act I find that in 1842 they divided 10 per cent. In 1843 they divided 10 per cent. In 1844 they divided 5 per cent. for the first half year, and they divided 4½ per cent. for the next half year. I am now talking of the Liverpool and Manchester line. But they have never divided more than 10 per cent.

84. (*Chairman.*) I suppose the question would have been tried if you had had good grounds and you thought you would succeed?—If we thought we had a legal remedy there is no doubt we should use it. There is a subsequent Act, a general Amalgamation Act with the London and North-western system, which I have not got, but which I shall obtain.

85. (*Mr. Glyn.*) I believe there was a subsequent Act in 1847?—Yes, I have applied for that, and it is promised to me.

86. (*Chairman.*) The complaint on this head at Liverpool is, that the spirit of the Act has not been carried out?—Yes; that the intention of the Legislature has been evaded.

87. (*Mr Lowe.*) What was the intention of the Legislature?—We take it to have been that a portion of the earnings upon this line, in excess of 10 per cent., that is, after paying the shareholders 10 per cent., should have gone to the reduction of the rates charged.

88. The Legislature has not said so?—The Legislature said that for every 1*l.* divided over 10 per cent. they should reduce their rates 5 per cent.

89. There has been no dividend above 10 per cent.?—No.

90. (*Mr. Horsfall.*) Why has the dividend not been increased?—Because the extra earnings upon that part of the line have been spread over the whole system.

91. (*Mr. Lowe.*) The Legislature never forbade that?—The Legislature never contemplated that.

92. Did they not leave the matter in the hands of the directors by saying that the reduction in the rates must depend upon the dividend?—Yes; it was presumed, I imagine, that if they earned more they would divide more, because that Act provides that they shall accumulate a reserve fund of 100,000*l.*; that after that is done, then the surplus shall be available for the dividend. It was thought that if they earned more they would divide more, a per-centage of the extra earnings to go for the benefit of the public in the way of a reduction of charge.

93. They never said that the extra earnings were to go for the benefit of the public unless the dividend was more than 10 per cent.?—I mean the extra earnings over and above the dividend of 10 per cent. I apprehend that they did not distinguish between what was earned and what was divided.

94. (*Lord Stanley.*) Do you say if a company which is upon the point of earning 10 per cent. upon their existing line, and which might be divided, thinks fit to extend itself by making branches, those branches earning a lower rate, and consequently diminishing the general rate of profit upon the whole line, that that is a violation of the spirit of the Act?—I contend that if this line from Liverpool to Manchester earns, as I believe it does earn, a sum largely in excess of 10 per cent., that to apply the whole of that excess for the purpose of making good the deficiencies upon traffic elsewhere, and to apply no part of it to reduce the charge upon the traffic is a violation of the spirit of that Act.

95. In that case was not the Legislature in fault when they allowed an amalgamation to take place between a paying line and another which was not making an equally good return?—I presume that the Legislature thought the companies understood their own business best. If the shareholders of the companies were willing to amalgamate, the Legislature probably did not think it necessary to introduce provisions for the protection of the shareholders. I am old enough to remember that the shareholders expressed the greatest disappointment at the result of their amalgamation; at least they did in Liverpool.

96. (*Capt. Galton.*) Is not a great part of the additional earnings made now due to the extension of the lines of railway?—Some part of them may be, but I doubt very much whether the larger portion of them is. The fact nevertheless remains that before this extension took place, they were earning 10 per cent. and if you take the natural growth of traffic which has increased since that time I think the inference is pretty strong that if with a small amount of traffic they could earn 10 per cent., with a much larger amount of traffic the earnings must be greater. The fixed charges are the same.

97. Had they not to make a large outlay of money, and had they not to construct a tunnel down to the river side?—Yes.

98. And to develope a very large goods station and other stations all along the line?—Yes.

99. (*Sir R. Hill.*) Had they not also to lay down heavier rails more than once?—No doubt there has been an increased expenditure, but the proportion which that bears to the increase of the traffic is after all remarkably small.

100. (*Mr. Glyn.*) Have you any idea of the figures representing the additional outlay both at Liverpool and Manchester on the lines of railway?—No; those figures I apprehend are entirely in the hands of the railway companies. I can only speak from my own personal observation of what has been done in Liverpool. We are not receiving the aid that we expected to receive but we are being charged in many cases the maximum rates.

101. (*Mr. Roebuck.*) When the Legislature allowed the amalgamation to take place, they did not prevent the companies from spreading the dividend over their whole system?—No. The inference which, I think, one may draw from this state of things is that in the Amalgamation Act those rights appear to have been expressly reserved; and, in the absence of anything to the contrary, I think I may infer that, in any further Amalgamation Act, a similar reservation would have been made.

102. (*Capt. Galton.*) Has the Liverpool Chamber of Commerce ever attempted to get up a rival company for the purpose of coming into Liverpool, with the view of getting the rates diminished?—No; that is quite beyond its functions. It exists for certain

definite purposes, and it has no power to step beyond those.

103. (*Chairman.*) I suppose that complaints of this kind have been frequently made to the railway companies?—Yes.

104. What answers have you received?—Always remarkably courteous and civil answers, but always ending in nothing.

105. Have they distinguished between the actual charges on the railway and the terminals, or has their reason for charging these high rates from Liverpool been stated to be the great terminal cost at Liverpool?—I believe that the matter was very closely investigated some years ago by a Parliamentary committee, and one of the gentlemen connected with the railway company then stated that the terminal charges might be taken at about from 1*s.* 6*d.* to 2*s.* a ton. Mr. Patterson, I think, was a witness examined on that committee, and therefore he will be able to speak with certainty upon the point.

106. Have the railway companies rested their charges from Liverpool to Manchester or other places upon the terminal cost?—They never have put it upon that ground in their communications with us.

107. (*Sir R. Hill.*) I understood that the terminal charges were excluded?—The terminal charges are the same for all distances, whether long or short. In the figures which I have given you the terminal charges in all cases were included. Those were the gross amounts paid.

108. But when you reduced them to a mileage rate I understood you to say that the terminal charges were excluded?—No; the terminal charges were not excluded from that; but that is an element to be taken into account. Assume that 2*s.* is, as I believe it is, ample to cover all terminal charges, the rate per mile would necessarily and properly be higher for carrying goods 30 miles than for carrying goods 90 miles.

109. May not the terminal charges, or rather the terminal expenses incurred by the railways, vary greatly; that is to say, may they not be greater or less in Liverpool than in other towns?—They would undoubtedly be greater in Liverpool than in other towns, but not greater in proportion to the traffic. That is the consideration that determines the cost. For instance, supposing the terminal charges in Liverpool to be any sum that you please, say 1,000*l.*, and that the amount of traffic carried through would be equal to 10,000 tons, the terminal charge there is of course 2*s.* per ton. You may have another town where the terminal charge is only 100*l.*, but, if the amount of traffic carried is only 200 tons, then you have a larger per-centage of terminal charges in that town than in Liverpool; and that I believe to be exactly the case.

110. (*Mr. Glyn.*) Do you say that 2*s.* for terminal charges would be generally a fair charge for every town in England?—I cannot speak with certainty upon that, but I believe that that has been already brought out in evidence before a Parliamentary committee, and a gentleman will be examined before you who was examined as a witness before that committee.

111. (*Mr. M'Clean.*) Are you aware that, as between Liverpool and Hull, the terminal charges include cartage?—Not upon all goods.

112. Then upon chemicals, which you have mentioned?—I am not aware that they do, but, if they do include cartage, I would ask whether they do not include cartage also in the rate from Newcastle to Hull.

113. From Newcastle to Hull they are without station charges; in the other case they are without cartage charges?—The rate from Liverpool does not include collection, I understand, of the goods.

114. No, it includes carting from the vessel and to the vessel?—But does it include cartage from the warehouse to the railway station?

115. Yes.—All I can say is, that it is quite the exception for the railway companies to cart the goods from the warehouses to the railway stations.

116. At Hull you are probably aware that there are lines of railway running into the chemical works?—Yes.

117. And at Newcastle?—Yes. I believe that the expense of carting may be taken at about 8*d.* or 10*d.* a ton. According to your statement the expense of carting in Liverpool is included, but it is excluded in Newcastle. If that be the case you would have to vary that rate by 10*d.* per ton.

118. Are you aware that the general charge for carting is 4*s.*?—I assure you that you are greatly deceived if you think that the expense of carting is anything like 4*s.*

119. Including the terminal charge?—That is different; but I know that the carting can be done at a profit at 10*d.* a ton.

120. From Sheffield to Liverpool there are two cartage terminals, and from Hull to Sheffield there is only one?—There would be the same terminal charges at both; the difference is in two cartages.

121. Yes?—The terminals being the same in both cases, the cost of carting would be, in my opinion, liberally allowed for at 10*d.* a ton.

122. That is, the general charge all over the kingdom is 2*s.* 6*d.* a ton?—I can assure you that you are in error upon that point, for there are thousands of people in Liverpool who would be delighted to take the carting at about 10*d.* or 1*s.* a ton; and I do not see, if that be the case, as I know it is, why the railway company should not do their work as cheaply as other people can do it at 10*d.* a ton.

123. (*Mr. Hamilton.*) For what distance?—Take all distances in Liverpool. Our system extends perhaps four or five miles; but I will take all distances, long and short, and I know that we can do it for 10*d.* a ton.

124. (*Sir R. Hill.*) Do you mean all kinds of goods?—I do not know what it might cost for carting some matters; that is a thing that you would require to have evidence upon; but taking the general produce, the sum that I have named would cover it.

125. (*Mr. M'Clean.*) Are the rates charged in any case higher than those which are authorized by the Acts of Parliament?—No. I am not aware that they are higher than those authorized by the Acts of Parliament, because the Acts of Parliament contain the maximum rates, which, for moderate distances, are very well, but which would simply be monstrous if they were applied to long distances; as, for instance, suppose I take a rate of 3*d.* or 4*d.* a mile, it might be perfectly fair to apply that to a distance of five or six miles, but not to a distance of 50 or 100 miles. Such a rate in that case would be simply preposterous.

126. (*Chairman.*) Do the rates as charged at Liverpool include the collection and the delivery of the goods?—As a rule, I believe they do not include the collection of the goods in Liverpool.

127. If the traders themselves carry the goods to the railway station, I presume they are not charged so much?—In nine cases out of ten the railway companies do not collect the goods in Liverpool.

128. (*Sir R. Hill.*) They do, I believe, deliver the goods coming into Liverpool; they carry them to the harbour, do they not?—In some cases they do, but that, I imagine, is under a special arrangement made at the time.

129. Do the charges which you have given us include the conveyance of the goods from the station to the warehouse or to the ship?—To the place of delivery.

130. You have given certain charges from certain towns to Liverpool?—No, the other way; the charges from Liverpool to certain places. It is the exception, so far as my experience extends, for railway companies to collect the goods in Liverpool. They may do so in certain special cases, and they do so, no doubt, in certain cases, but it certainly is not the rule.

Mr. C. Clark.

23 March 1865.

131. (*Mr. Glyn.*) It is done by agreement, is it not?—Yes.

132. (*Chairman.*) Do you complain of the charges to Liverpool, as well as of those from Liverpool?—Yes, precisely the same.

133. The latter are also, in your opinion, exceptionally high?—Yes, as compared with the charges made to other towns.

134. (*Sir R. Hill.*) Do the sums which you have given us, generally speaking, represent the charges from Liverpool?—Yes. All the cases that I have given you have been comparisons of the rates of charge for carrying goods from Liverpool to certain places, and carrying the same goods from another port to the same places.

135. (*Mr. Roebuck.*) I think you read a statement about certain railway materials from Staveley to London and Staveley to Liverpool; that was not from Liverpool?—No. When I speak of rates I speak as to those tables which have been prepared, and which I have handed in. The tables which I have quoted from, are all tables of rates from Liverpool to certain places, and the special instance which I have given you from the letter I quoted on the subject of rails referred to the rate charged from the place of production to the port of shipment, that being in one case London, and in the other Liverpool.

136. (*Sir R. Hill.*) You have given us the rates charged upon salt. Those must have been the rates to Liverpool?—Yes. That was an instance showing the rates charged from the place of production to Liverpool, on the one hand, and from the same place of production to the port of Hull, on the other.

137. Did the charge, which I think you gave of 4*s.* a ton, include the delivery of the salt beyond the station to the warehouse or the ship?—No; that is the river charge; that does not come into the railway station.

138. Your complaint is, as I understand you, that they do not carry your salt?—Our complaint is, that there is no competition, and in consequence of that, the rate has remained the same for a long time without any variation.

139. (*Mr. Lowe.*) Have you any remedy to suggest to the Commission for this state of things?—No. The Scotch people have found a remedy for it, so far as they are concerned, and their remedy has been, to oppose every railway bill for amalgamation or for traffic arrangements unless the parties would consent to introduce clauses giving them moderate rates of carriage between certain towns. That has been done just within the last few days or few weeks, both as to Edinburgh and Glasgow. They have actually stipulated for rates considerably lower between Edinburgh and Glasgow, a distance of 48 or 50 miles, than the rates that we now pay from Liverpool to Manchester, which is a distance of only 31 miles. That is one remedy, but whether a more general remedy might not be found, by the exercise on the part of the Legislature or the Government of any controlling power over the administration of railways, is a matter upon which I have not yet formed any opinion; and I have scarcely had sufficient materials to do so upon a point which is so important. I think it is, however, abundantly clear, that there must be the very strongest public necessity for endeavouring to control a system which causes so great a waste of capital as the present system does. If you carry goods 100 miles by any system of tolls across the country, when they might be shipped from another place only 30 or 40 miles distant, it is clear that there must be a great waste of capital there, and that it must ultimately fall upon the public in some shape or other.

140. (*Mr. Roebuck.*) Might not other ports complain in the same way that you now complain?—I do not see that any port has a right to complain if they are put upon an equal footing, that is to say, so long as they are all charged the same sum for the same service, I do not see that any one has a right to complain. Liverpool would not complain of Hull getting a large share of the Baltic trade. They would have no right to complain of Liverpool getting its share of the Irish or the American trade. If a part of the trade that would go naturally to Hull were sent to Liverpool in consequence of a much higher rate being charged, then Hull would have a right to complain. At Liverpool we do not complain of any natural advantage that one port possesses over another, but we do complain that the advantages that we do derive and would derive from our natural situation, are neutralized, and more than neutralized, by this system of charge.

141. Speaking now of your proposed remedy, is it proposed by you to make equal charges for equal services?—Yes.

142. How would you accomplish that? how would you put it into a legislative form?—I think it might be done, for instance, in a railway bill, in either of two ways, either by binding a company to carry from a given port, say, Liverpool, goods from Liverpool over their line at rates which are not in excess of the rates they charge from other places for carrying the same goods the same distance; or it might be done by the introduction into the bill of a special schedule of rates, based upon the rates they actually charge, and providing that any advantage that was given to one place should be equally given to another, that is to say, where the distances were alike.

143. (*Mr. Lowe.*) You would oblige a railway company never to charge more than it does at the lowest point?—Yes; I think that where the conditions for carrying the traffic are as favourable in the one place as they are in any other place, the charge for carrying the traffic from that place should not be in excess of the charge made for carrying it from another.

144. But suppose that a company, by the competition of water carriage, is driven to charge a very low rate in order to retain the traffic, you would oblige the company to make the same charge everywhere, even where that state of things did not exist?—I think the answer to that is this, that if you take two points between which the water competition exists, and in consequence of which the rate is carried down very low, either that traffic is worth carrying at that rate or it is not; if it is worth carrying, then there is no reason why the same advantage should not be given to the public in other places where the cost of carrying is not in excess; if it is not worth carrying, it is a question whether the company has been wise in continuing the competition.

145. Then you answer in the affirmative; you would say that the lowest charge should be the rule?—No; I do not say that generally, but that if you have two points between which the cost of carriage is as low as it is between any other two points upon the same line, the rate charged for carrying should not be in excess of the rate charged for carrying elsewhere. But if you introduce a very exceptional case, I do not see any objection to meeting that with an exceptional provision.

146. (*Mr. Roebuck.*) Do not the gradients upon a line of railway cause a difference in cost from one place to another. Suppose, for example, that the gradients are more favourable from one town to another, then the cost to the company would be different?—Yes.

147. Then in consequence of that the charges would be different; but how would you put that into a legislative form; how would you meet that difficulty?—The best way I think would be this, to take a rate which was, upon the whole, a fairly remunerative rate, under the most unfavourable circumstances that could reasonably be imagined, and make that the maximum rate applicable to all places alike, not fixing a rate per mile for long and short distances alike, a rate which may be perfectly fair for short distances but grossly unfair for long distances, but making a separation between the carrying charge and the terminal charge, and taking a certain scale, and saying that the maximum rate for carrying

20 miles shall be so much, and the maximum rate for carrying 50 miles so much more, and the maximum rate for carrying 100 miles so much more, and base that maximum rate upon a rate which shall be remunerative to the company under the most unfavourable circumstances that can reasonably be imagined.

148. You think that that would meet the difficulty ?—Entirely.

149. Suppose, for example, that the company never exceeded the maximum rate, but applied the maximum rate, say, to one town, and the minimum rate to another, as they do now, how would you get out of that difficulty ?—I apprehend that the only way of getting out of a difficulty of that kind, although it is certainly not one easily got over, would be by a general clause of the kind I have mentioned, binding the railway company to carry for equal rates, where the circumstances were equally favourable.

150. But how are you to decide that point ?—That is the practical difficulty to which you come. I think you must have some tribunal to appeal to.

151. How is the tribunal to decide that. The tribunal is neither omnipotent nor omniscient ?—You can only decide it by a process of inquiry.

152. That inquiry must take place upon every occasion. Suppose, for example, that one man sent goods from A. to B., another sent goods from A. to C., and another from A. to D., there would be three different cases, and would you have an inquiry for each ?—No, that is not what I am contemplating. You are assuming now, I presume, that there is to be a maximum charge calculated upon the basis of a remunerative rate to the company under what might be reasonably considered the most unfavourable circumstances, and that there should be as between certain towns at given distances specific rates.

153. You would have, as I understand you, each town through which the railway goes named in every Act ?—I think it might be done in this way. I should propose to take certain distances, starting from Liverpool as a basis. I should mention that we have confined our attention to Liverpool, but you are now asking me questions having reference to a state of things in other parts of the country. But what I should propose is this, to take a distance, say under six miles, and to charge for that at a certain rate, say 1*s.*, and 2*s.* to cover the terminal charges, making together 3*s.*

154. No matter what the gradients might be ?—I mean from Liverpool.

155. Going from Liverpool you may go to every part of England ?—Yes ; but I mean under six miles from Liverpool. If you want to send goods, according to this scale, a distance of six miles along that line, the rate, according to my proposition, would be 1*s.* for carriage and 2*s.* for terminal charges, making together 3*s.*, that is at a rate of 2*d.* a ton per mile, but that rate of 2*d.* a ton per mile diminishes in proportion to the distance carried. If the distance were 12 miles I would take it at $1\frac{1}{2}d.$ per ton per mile, still allowing 2*s.* for terminal charges.

156. A distance of 96 miles from Liverpool south might, and I think does, imply a very different state of gradients than 96 miles in another direction, and therefore to the company there would be a very great difference in point of cost, and if there were a great difference of cost on account of the comparative difference between the gradients north and south, would you lay down the same rule that you have just mentioned for the 96 miles with bad gradients as for the same distance with better gradients ?—I understand the question to be, would we apply the same rate per ton per mile for 96 miles in every direction without reference to the cost of construction. I say that we would, because you must take the average cost of construction over the entire system, and not the cost of construction over any particular 96 miles. The scale should be based upon the average cost of construction.

157. (*Sir R. Hill.*) Does it not frequently happen that steep gradients are adopted to save cost to the company in the construction of the line ?—Undoubtedly.

158. Therefore, although the company might incur a slight additional charge in working over a bad gradient, it would have incurred a much less charge in the construction of the line ?—Yes, undoubtedly.

159. The company chose a steeper gradient because, upon the whole, they considered it to their advantage ?—No doubt of it. They saved the outlay of capital in the first instance in the construction of the line at the cost of a little additional expense in working the traffic over that part of it. The Commissioners will understand that I am taking Liverpool as a fair example, and not taking the possible cost of the construction of a railway through the Himalayas.

160. (*Chairman.*) You complain more of the inequality of the charges than of their absolute amount ?—Yes.

161. You would not care much if you were charged the same rates as at present, provided the same rates were also charged from Hull or Newcastle ?—No. We complain of both, but first and mainly, that the charges are unequal, also that they are excessive. If we were all sharers in misfortune, we might bear our misfortune patiently, but when we find that we are the main sufferers, and that other people are not treated so badly, that rather aggravates our complaint.

162. You complain of the amount of the rates charged, as well as of their inequality ?—Yes ; as in the instances I have given. We complain that the charges are excessive, as well as of the inequality of their pressure.

163. (*Mr. Dalglish.*) Then, if I understand you, you would by legislation make the London and North-western Company, who are overloaded with business, charge the same rates as the proprietors of the line from Hull to Bradford, where there is a great want of trade ?—No, we do not seek to do anything of the kind.

164. How otherwise are you to equalize the rates ?—What we seek to do is this : we desire to compel the same company to charge from Liverpool the same rate that it charges for doing the same work elsewhere.

165. But I am talking about the rates. You complain that from Liverpool to Bradford the rate is, say, $2\frac{1}{4}d.$ a mile, or whatever it may be, and from Hull to Bradford it is $1\frac{3}{4}d.$, and you desire to have an equalization of the rates, so that your merchandise going from Liverpool to Bradford may be taken at the same rate per mile as from Hull to Bradford ?—We are willing to pay the company that takes our goods from Liverpool to Bradford a rate which shall not be in excess of the rate which that company is charging for carrying the same goods the same distance over other parts of their line.

166. That applies only to one company ; but I thought you introduced the question of rates charged by different companies ?—Yes, but that is a separate question.

167. You desire to have Liverpool placed in as favourable a position for carrying its produce to Bradford as that produce could be carried for from Hull to Bradford ?—Yes.

168. Although it would be carried over two different systems of railway ?—Yes.

169. Do you see any way by which the Legislature could so deal with the question that the London and North-western Company, who have plenty of work to do, should be compelled to charge only the same rate as another railway company who were charging a very low rate because they wished to increase their trade ?—If you compel the Lancashire and Yorkshire Railway Company to charge a rate not in excess of the rate charged for carrying the same goods the same distance over other portions of that line, the practical effect would be to put the rates between Liverpool and Bradford, and between Hull and Bradford, upon a footing, if not of absolute equality, of at least a close approximation to it. It

Mr. C. Clark.

23 March 1855.

might not give you a perfectly uniform rate, but it would be more near to that than it is now.

170. Following that up, you have given us the rates between Liverpool and Preston, and Fleetwood and Preston. I will suppose that the two lines are part of the same system, and that the rate on the one is a $1\frac{1}{4}d.$ per mile, and the rate on the other $2\frac{1}{4}d.$, Fleetwood to Preston ?—Yes, on timber.

171. Then, is it not possible on the Fleetwood line that there is a great want of traffic, and that the railway company finding Fleetwood a very desirable port for the importation of timber, carry it at a lower rate, in order to relieve their other line ?—Yes.

172. Do you think it would be very fair to them to say, "You must charge the same rate from Liver- "pool to Preston as from Fleetwood to Preston ?"—Yes ; perfectly fair. I do not mean that you should say they should charge the same amount from Liverpool to Preston, which is perhaps 30 miles, as from Fleetwood to Preston, but I mean at the same rate per mile.

173. Do you mean that, taking into consideration that one part of the railway is quite overpowered with work, while the other has not half traffic enough ?—Yes ; but why is it overpowered ? It is overpowered for this reason, that, instead of taking the funds which they derive from the traffic upon the line, and employing those funds to provide increased accommodation, they have been diverting those funds to make a line, and to construct docks and erect warehouses where there is actually no traffic at all. Instead of giving increased accommodation to the traffic in its natural channel, they have spent their money to force it into another channel, and that is the reason why these unequal rates exist. That is the very thing of which we complain, that they spend their money to force the traffic to go elsewhere, instead of sending it in the natural channel and giving increased accommodation. We say that, not only are we damaged with the public to a very large degree, but the railway company endeavours to force that traffic out of its natural channel, and we know that that is always an expensive mode of proceeding.

174. (*Mr. Roebuck.*) Do not your wishes converge altogether to one point, namely, uniformity of charge? —Uniformity of charge from the same place and for the same distance. That points, not to a uniform mileage rate of, say, $1d.$ or $1\frac{1}{2}d.$ for any distance, but to a uniform rate for an equal distance and under similar circumstances.

175. (*Sir R. Hill.*) Should you see any objection to an arrangement of this kind to extend to all railways ; *viz.*, that in respect of each description of goods there should be, first, a charge for loading and unloading and for other terminal expenses, that charge being made in all cases, whatever the distance might be ; then, in addition to that, a uniform mileage rate, whatever the distance might be ? —The first point that you put is absolutely essential, if you come to anything like a fair adjustment. You must separate between the terminal charges, which are fixed, and the carrying charges, which fluctuate, in proportion to the distance. The only objection that I can see, eliminating altogether the question of the terminal charges, to fixing a uniform mileage rate for distances long and short, is this, that there are two elements of cost, which are smaller in long distances than in short ones. Every manufacturer knows that if he has to get up steam, it will cost him as much to get up steam for three hours as for four hours, and the cost of the men's wages will be perhaps as much for three hours' work as for four. Thus there is a small fractional saving in going long distances upon the cost of fuel, and upon the labour employed, as to wages, in driving the train, as compared with short distances.

176. Might not those expenses be merged in the terminal charges ?—They do not form any portion of the terminal charges.

177. Is not getting up the steam strictly speaking a terminal charge ?—Yes ; but keeping it up after you get out of the station is not. What I mean is this, you have a certain amount of motive power sufficient to propel a train, say 50 miles ; but the motive power is not completely exhausted at the end of that distance, there is as much motive power with the same expenditure of fuel as would have sent the train say 5 miles further ; and if you charge for 50 miles at the same rate as for the longer distance you may be unduly weighting the longer distance in favour of the shorter one.

178. Then the total charge divided by 50 would give a higher mileage rate than the total charge divided, say by 100 ; but in all these matters all you can do is to make an approximation to fairness. Do you see any practical mode which could be laid down by the Legislature which would make a nearer approximation to fairness than that which I have suggested ? —I think that the mode which should divide the distances, and which should stipulate for a slightly fractional higher rate for a short distance, than for a long distance, would be a closer approximation to exact justice than your suggestion.

179. (*Mr. Roebuck.*) Apply that rule to the terminal charge. The terminal charge for 5 miles being the same as the terminal charge for 100, it necessarily falls upon the five miles in a much larger degree than upon the 100 ?—Yes.

180. Then applying your rule as to division of distances to the terminal charges as well as to the railway charges, would not that be a nearer approximation ? —No. In my opinion the first thing to do is to strike out the terminal charges when it is a question of comparative mileage rates, because the terminal charges being the same for short as for long distances, you cannot get anything like an accurate comparison. The question is what is the actual cost of carrying goods, say, 100 miles, as compared with the actual cost of carry them 50 miles, and setting aside the terminal charges, all the elements of cost appear to be the same, with the exception of a small economy in fuel in driving the train, and a small economy in the wages of the labour employed. These two points are in favour of a long distance as compared with a short distance, and therefore on that ground I think that the long distances ought to be charged a small fraction less per mile than the shorter ones.

181. Do you not think that that might be compensated for by the difference arising out of the terminal charge, which would be thrown upon 5 miles, being greater than upon 100 miles?—Certainly not; because there is no gain on the short, and no loss upon the long distance, so far as the terminal charges are concerned.

182. (*Mr. Glyn.*) You appear to leave out in your calculation all reference to capital ?—In what calculation ?

183. You have enumerated several heads of expense, the cost of fuel and so forth, but you have not referred to the capital originally laid out, and which in the case of one line may have been 100,000*l.* a mile and in the case of another only 10,000*l.* a mile ?—I think that you have a little misapprehended what I meant to say. That which I was comparing was the cost of carrying goods, say, 50 miles, and the cost of carrying goods 100 miles over the same line of railway, and I was endeavouring to make a separation between the items of cost, which are equal in both cases, and the items of cost which are unequal, so as to see whether the principle of a uniform mileage rate could not fairly be applied. Now the capital employed in the construction of a line is one of those items of cost which equally applies to 50 miles as to 100 miles ; that is, the cost of the construction of a line is twice as great on the same line for 100 miles as for 50 miles and so far as that goes a uniform mileage rate would be perfectly fair on the same line.

184. But not as compared with some companies where the question as to original outlay might be very different ?—If there was a very large difference in the outlay, or supposing, for example, that the traffic

was taken over two lines of railway belonging to the same company, there might be a difference there; but I think the point is this, that the cost of conducting the traffic does not depend upon the original amount of the capital expended, but upon the proportion which the traffic carried over the line bears to the cost of conducting it, that cost of conducting it including the interest upon the original capital. The actual charge for carrying relatively may be much smaller upon a high priced line than upon a low priced one; and I believe that that applies with special force to the line between Liverpool and Manchester, for they have a line there of which the original cost was great and the proportionate cost of conducting the traffic remarkably low in comparison with conducting similar traffic elsewhere.

185. (*Lord Stanley.*) Parliament having left a large discretion in the hands of railway companies as to the charges they may make, you wish to limit that discretion and compel them to place the traders sending goods by their lines for equal distances upon an equal footing?—Parliament has limited I think already, or intended to do so, the power of railway companies to charge rates, by fixing certain maximum rates, and I apprehend the object was to show railway companies that they were not at liberty to charge anything they pleased, and that they were introduced as a protection to the public. My contention is that those maximum rates are so constructed that it is possible for railway companies under them to charge excessive rates, and they do so in the case of Liverpool. What I seek is to compel railway companies to remove the inequalities which now exist between the charges for carrying goods from Liverpool and the charges made for carrying from other places.

186. Is not the security which the shareholder has for getting a return for the capital he has expended in the construction of a railway the power of charging anything that the company pleases within the limits which Parliament has fixed? and how, after that bargain has been made between the shareholders and the public, can you fairly diminish the rate on condition of receiving which the shareholder has consented to invest his money in the undertaking?—There will be no diminution of the security unless you propose to reduce the rates to a point at which the railway company will be unable to earn the usual dividend. It is a mistake to suppose that by charging the maximum rates the security to the shareholder is in any degree increased; in point of fact I believe that experience will show that a reduction of the rates would often be the wisest policy to pursue in the interests of the shareholders themselves.

187. As a matter of fact Parliament has left it in the hands of the shareholders to decide as they think fit upon what rates they shall charge within the limits fixed?—As a matter of fact they have done so.

188. (*Chairman.*) You would like the maximum tolls to be diminished, and you would compel each railway company to carry at a uniform rate over their whole system?—I should like to have the maximum rates separated in the first instance into two elements, terminal charges, and carriage rates. I would have those carriage rates diminished and classified in proportion to the distances over which the goods were carried.

189. (*Mr. Roebuck.*) Are you aware whether railway companies make specific contracts with individuals for each specific service which they may perform for them?—I believe that is the case now. I have made the very closest inquiries upon this subject, and if you ask me my opinion, I say that I entertain not the slightest doubt of it; but the difficulty is this, that there is almost an insuperable difficulty in getting any proof of it, unless you had the power to compel a man to give evidence, and the men who could give the evidence are the very men whose interest it is to conceal the fact; but that the fact is so, is, I believe, perfectly notorious.

190. For example, suppose that A., wanting to send a certain quantity of cotton from Liverpool to Manchester, pays one rate, having made a special contract with the railway company to carry his goods; and then B. comes wanting also to send cotton to Manchester; do you think it has happened that a different contract has been made with B. as to the carriage of his cotton from that which has been made with A.?—Substantially I believe that to be so, but it is not done in the way you suggest. I believe that by entering into certain arrangements with the companies one trader is able to get his goods carried between two points at rates considerably lower than are charged to other traders sending goods between the same points. I am speaking now entirely from knowing that the thing is notorious, although I cannot obtain proof of the fact.

191. If I have been informed that this is done, you think it is quite true, and that the schedule made by the company of their rates is no guide to actual reality, but that in each particular case there may be, and there very often is, a contract made to carry a particular person's goods at certain rates?—Do you mean the schedule in the Bill?

192. No; I mean the schedule which is put forward as that according to which the company would carry goods?—In many cases I may say that that schedule is perfectly illusory, for you can get goods carried at rates which are considerably under the rates named in that schedule; and I think I can give the Commission a proof of that. I have received from a gentleman engaged in the corn trade in Liverpool, one of the largest corn merchants there, a list of the rates which his firm have actually paid, and do pay, upon the carriage of flour from Dunkirk to Liverpool and Manchester. They get the flour carried from Dunkirk *viâ* Hull, Goole, Hartlepool, or Newcastle-upon-Tyne through to Manchester at 16*s.* a ton, including the sea carriage from Dunkirk to Hull or Goole or Hartlepool, and all expenses of unloading there, and the land carriage from those ports respectively to Manchester. That is done for 16*s.* a ton, and they have got it done for 14*s.* a ton. They can get the same service rendered on flour going to Liverpool for 18*s.* a ton; but if you want to get those goods from Hull to Liverpool alone the rate will be 12*s.* 6*d.*; that is to say, you get the service, sea and land together, and all the incidental charges, done for 18*s.* in the one case, and for 16*s.* in the other, but if you want a certain land carriage done alone the rate is 12*s.* 6*d.* I believe that in special cases it has been done at a through rate absolutely as low as the land carriage alone.

193. Would there, in your opinion, be a different charge made to different individuals?—I believe that it is quite possible. In the case of the gentleman who gave me the information, although he was very unwilling to give it, I believe that he got large quantities of goods at rates very considerably under the nominal rates which the company professed to charge.

194. (*Mr. Glyn.*) There was a very large quantity carried, was there not?—He did not say in this particular case anything about the quantity; but there is no doubt that in the case I speak of, where the lower rate, or the rate as a through rate, was charged for the entire service, though it was a lower rate than the company professed to charge for the land service alone, there is no doubt that in that case the quantity was large. Still it is certainly not easy for anyone to understand how it can be cheaper to carry goods from Dunkirk to Newcastle-upon-Tyne by a steamer, having to pay all the charges from Newcastle-upon-Tyne to Manchester or Liverpool by railway, than it can be to bring goods from Newcastle or from Hull direct by railway alone.

195. (*Mr. Lowe.*) Did you say that all the lines of railway running out of Liverpool are overloaded with traffic at the present time?—No; what I said was, that the excess of traffic in proportion to the amount of accommodation occurred when there were simultaneously large imports of cotton and large

Mr. C. Clark.

23 March 1865.

imports of corn; now, unfortunately, there are not those large imports of cotton.

196. Still you consider that the lines are overloaded?—At certain times they are. Under the circumstances I have already mentioned, the amount of traffic passing over those lines has been greater than they were able to accommodate; and I think so from this fact, that I, as a merchant, have frequently despatched goods to the railway station, and I have found that there has been detention there for several hours before they could unload the carts; and there have been frequent complaints made of the detention of goods upon the lines.

197. Then is not your case this, that you want another railway or two running into Liverpool?—No; we want additional railway accommodation, whether by the same companies or by other companies we do not mind.

198. Is not the obvious course for you to adopt to get up another railway or two, or intimate to the present companies that you will do so unless they double their lines and provide extra accommodation?—That would amount to this, we might get an additional railway or two, but then we should not be in a better position, if, by entering into traffic arrangements with the London and North-western Company they determined to charge the same rates as have been charged heretofore.

199. You think that the competition would not be kept up?—No; for, it must be borne in mind that, although gentlemen might get up another line, you could not prevent them from alienating their shares.

200. Then you think you could not do such a thing in Liverpool, and that there is no possibility of getting up another railway?—There would be every possibility of getting it up, but we should be in no better position unless they treated us in some different way. There is a company at the present time seeking to come into Liverpool, their object being to construct an independent line from Manchester to Liverpool, and if that company, the moment it gets its bill, agrees to charge the same rates as the other companies, we shall be just in the same position.

201. Is that proposed line being supported in Liverpool?—I cannot say that we are supporting it entirely; but we have offered to support it on certain conditions, that is to say, on their giving us more equal rates of traffic.

202. Do the projectors of the line decline to do so? No; they do not decline it, but, on the contrary, I may state this, that I have received a letter from the Chairman, in which he expresses his general approbation of the principle of equality of charges, and promises, so far as he is concerned, that everything shall be done to give us those equal charges. I am referring to the Manchester, Sheffield, and Lincolnshire Railway Company, and I mention this as a curious illustration of these matters. I was asked this question, whether we had ever gone to the railway companies, and what we got by going, and this, I think, will show what we do get. The chairman expresses his approbation of the principle of equal charges, and says that that which prevents him from introducing a clause giving us equal charges is the fact that a Royal Commission is now investigating the whole matter, and as we shall have an opportunity of stating our case before that Commission, it would be impolitic to do what we ask him to do.

203. (*Mr. Roebuck.*) The question is whether the same difficulty as to competition does not arise in other companies. Take, for example, the case of gas companies, and suppose that there are three gas companies in the same town. For a certain time they compete with one another, and the public benefit by it; but by-and-bye they say,—"It is time for us to "combine. We will divide the town and charge the "same rate for the gas supplied." Is not that exactly the same case that would occur in Liverpool if another railway was laid down there?—I think you could not have given a happier illustration of the case of Liverpool than the one you have given as to the gas companies. What you have supposed, actually exists at Liverpool. We had in Liverpool, I think, two gas companies, and at that time the price of gas was, I think, either 4*s.* 6*d.* or 5*s.* per 1,000 cubic feet. Those companies wished to amalgamate, and they came to Parliament for increased powers, and a clause, quite analogous to the clause in the London and North-western Bill, was inserted, binding the companies to this, that when their dividends exceeded 10 per cent., they should reduce the price of gas; and the consequence has been that the price of gas in Liverpool has been reduced, I think, 33 per cent. We have no objection to the railway companies entering into any arrangement they like, provided that we, the public, get a fair share of the benefits, if there are any, arising out of amalgamation or traffic arrangements. What has actually happened at Liverpool with regard to the price of gas would have happened as to the rate charged by the railway companies, if that very wise provision of the Legislature in 1826 had not been evaded or got rid of.

204. Do you believe that any legislative enactment as to the maximum or minimum dividend can be so framed that it cannot be evaded?—I am not prepared to set any bounds to the power of human evasion, but still I think it is quite possible to draw up provisions that would render evasion very difficult; and, moreover, I think it would be possible to attach such penalties to evasion as to prevent it.

205. You think that when competition is limited to a small number, competition is a good thing?—I think that competition is a good thing, whether it be limited to a small number or to a large number.

206. But when it is limited to a small number, do you think you can regulate the competition; will it not be evaded in spite of all you can do, as in the case of the gas companies; how could you prevent it?—The gas companies have not evaded it, because there was a provision, and we get the advantage of that provision. They do not evade it. As their profits increase the price of gas is diminished, and the reduction has been, I believe, from 25 to 33 per cent. in Liverpool.

207. (*Mr. Glyn.*) What dividend is paid?—10 per cent.; that was the limitation.

208. (*Lord Stanley.*) Parliament having originally authorized these companies to charge a certain sum per mile for all traffic, the shareholders having put their money into the undertaking on the express understanding that they were to be allowed to make a certain charge, do you contend that Parliament can now, without committing a breach of faith, compulsorily reduce the charge which the companies are allowed to make, without refunding to the shareholders the money they have invested?—I contend that Parliament has not fixed specific rates which the railway companies are to charge, but they have fixed a specific limit beyond which they are not to charge; they have fixed maximum rates.

209. Does not that come to the same thing as allowing them to charge whatever they please within those maximum rates?—I think not, because one must remember that those maximum rates were fixed when the cost of transit was not well understood, and when people did not know what the cost of conveying goods and passengers was. Therefore those maximum rates were taken as rates that would protect the public on the one hand, and yield a fair dividend to the shareholders on the other. The company was at liberty to take less, but on no account to charge anything more.

210. You then put it in this way, that because the cost of transit is less than it was supposed to be, and because the bargain turned out to be better for the company than was expected, therefore Parliament should interfere again and violate the bargain that was made?—I would put it in this way, that Parliament has given to those companies a monopoly of the inland carriage of the kingdom, and that it has given to those companies that monopoly, not for the benefit

expressly of the shareholders, not upon the allegation that it is for the sole advantage of the shareholders, but upon the allegation that it is for the advantage of the public. The preamble of the bill to which I have referred states, that "whereas the making of this "railway will be of great public utility;" and that is the allegation upon which the railway is made, and upon which this monopoly is granted. I take it that the intention of fixing these maximum rates was to protect the public against the possibility of railway companies levying extortionate rates upon the public; and I do not conceive that by checking the power which railway companies now exercise of charging excessive rates to the public in one district as compared with others, you would diminish the value of the security that railway shareholders would have. The Acts to which I have referred are the 7th of George 4th, chapter 49, sections 128 and 138, date 5th May 1826. Also the 8th and 9th of Victoria, chapter 198, date 8th August 1845, and the passages to which I have referred are in the preamble, and clause 10.

Mr. C. Clark.
23 March 1865.

The witness withdrew.

Adjourned to to-morrow at 12 o'clock.

Friday, 24th March 1865.

PRESENT:

His Grace The Duke of Devonshire K.G., F.R.S.
The Right Hon. Lord Stanley, M.P., F.R.S.
The Hon. E. F. Leveson Gower, M.P.
The Right Hon. Robert Lowe, M.P.
Sir Rowland Hill, K.C.B., F.R.S.
J. A. Roebuck, Esq., M.P.
T. B. Horsfall, Esq., M.P.
Robert Dalglish, Esq., M.P.
George Carr Glyn, Esq., M.P.
Captain Douglas Galton, R.E., F.R.S.
E. T. Hamilton, Esq.
William Pole, Esq., F.R.S., *Secretary.*

His Grace THE DUKE OF DEVONSHIRE in the Chair.

Mr. Charles Clark further examined.

211. (*Chairman.*) Do you now produce a copy of the Act of Parliament to which you yesterday referred, the last act of amalgamation?—I hold in my hand a copy of the Act of Amalgamation between the Liverpool and Manchester Railway Company and the Grand Junction Railway Company and the London and Birmingham Railway Company, forming together what is now known as the London and North-western Railway system. It will be remembered that I pointed out yesterday in the Act which I did produce, the Act of Amalgamation between the Liverpool and Manchester line and the Grand Junction line, that there was an express reservation of those rights which were given to the public by the original Bill of the Liverpool and Manchester Railway. But it was suggested by a gentleman, who sat to my left, that although those rights had not been taken away by the particular Act which I produced, yet if I had produced the subsequent Act it might probably be found that the case was different. I have now the Act before me, and I find that not only does the preamble of this Act, dated 16th July 1846, constituting the London and North-western Railway, expressly reserve the rights given to the public under the former Acts, but it goes much farther even than my statement, for there is an express clause (clause 2) which states that, "and as to all such and so many of any "the provisions and powers in the said repeated "Acts," one of which is the Act under which the Liverpool and Manchester line was made, "or any or "either of them, contained, for the benefit, advantage, "security, protection, or convenience of the public at "large, either in person or property, as shall not by "or by virtue of this Act or the incorporation of the "said Companies Clauses Consolidation Act, 1845, "and the Railways Clauses Consolidation Act, 1845, "be either expressly or by reference repeated or re-"enacted or otherwise provided for, the same shall "remain, continue, and be in full force and virtue "notwithstanding the repeal of the said Acts, and "shall be applicable to and may be enforced upon "and against the Company hereby incorporated, "and the railways and works hereby vested in the "same company, as fully as the same were applicable "to the said respectively hereby dissolved companies, "and might have been enforced against the said "respectively hereby dissolved companies, or any or "either of them, in case this Act had not passed." I think that the Commissioners will see that that clause goes even farther than my statement. There is just one other point in reference to this Bill that I should like to refer to, and it is in reference to a series of questions that were put to me by Lord Stanley. The questions were to this effect, whether the request that we are now making was not that we should ask the Legislature to revise the maximum tolls which, under the existing Acts of Parliament were granted to the railway companies, and whether that would not be asking the Legislature to commit a breach of faith with the shareholders who have advanced their money upon the faith of having the power to collect such maximum tolls. I find in this same Act, in the 76th Clause, that there is an express provision to meet the very case which I have suggested, and it states this, "And be it enacted" (after having granted certain maximum tolls in the usual manner) "that nothing "herein contained shall be deemed or construed to "exempt the railways by the said recited Acts or by "this Act amalgamated or authorized to be made "and completed from the provisions of any general "Act relating to such Acts, or of any general Act "relating to railways which may hereafter pass during "the present or any future Session of Parliament, or "from any future revision and alteration, under the "authority of Parliament, of the maximum rates of "fares and charges authorized by this Act." I submit very respectfully to the Commission that that is a complete answer to the question put to me as to whether we were not asking the Legislature to commit a breach of faith with the shareholders for the advantage of the traders and general consumers in the country.

The witness withdrew.

Mr. John Patterson examined.

Mr. J. Patterson.
24 March 1865.

212. (*Mr. Horsfall.*) You are a merchant at Liverpool extensively engaged in the foreign trade of the country, especially the corn trade?—Yes.

213. That branch of commerce is very extensive at Liverpool?—Yes, it is very large.

214. You are also a member of the Chamber of Commerce at Liverpool?—I am.

215. You are aware, I believe, that very general complaint is made that the charges on several of the railways running out of Liverpool are in some instances 50 per cent. more than are charged on the same lines in other parts of the country?—I am.

216. Have those complaints been preferred to the different railway companies?—They have by the

Mr. J. Patterson.

24 March 1865.

corn trade particularly. About four years ago a statement of those charges was prepared, and that was submitted to each of the railway companies and the other great carrying companies from Liverpool. Their attention was invited to that statement, and it was suggested to them that an important reduction should be made.

217. What was the result of those complaints or suggestions?—We received an answer that the circumstances should be fully investigated, and that every attention should be paid to the representations of the corn trade.

218. Has due attention been paid to those representations?—The performance has signally failed.

219. Has the corn trade prepared a tariff which they think would be equitable as regards the public, and remunerative to the company?—They have.

220. Will you be good enough to state to the Commission the substance of that table?—The table is based upon the principle that goods such as corn could be carried distances of between 48 and 96 miles at 1*d.* per ton per mile profitably, due allowance being made for proper terminal charges.

221. (*Sir R. Hill.*) In addition to the 1*d.* per ton?—Yes; the charge of 1*d.* per ton per mile being from station to station, the terminal charge being understood to be a charge for the use of the station during the time necessarily employed in the loading, with a reasonable time for the delivery and a reasonable charge for the loading and unloading, it being the understanding of the corn traders that that traffic, and indeed all traffic with which they are acquainted, would be most effectually carried on by allowing the customers to deliver the goods at the stations, and taking them from the stations. Of course this does not refer to small parcels, but to articles of merchandize.

222. Is there a very general feeling that the corn trade of Liverpool, as compared with the trade from other ports, is unduly weighted with charges by the railway companies?—There is a very general feeling of that kind, and we will endeavour to prove its correctness. This printed statement (*See Appendix C*), which I hold in my hand I believe has been already inserted in the proceedings of the Commission; but I should like to put it in with this remark, that since it was prepared it has been discovered that there is an inaccuracy in one of the items relating to the charge from Liverpool to Sheffield. It is stated there that the rate of carriage is 12*s.* 6*d.* a ton. It was originally printed by the corn trade as 15*s.*, but when this paper was revised, as it was, by the goods manager of the London and North-western Railway, he altered the rate to 12*s.* 6*d.*, and it has been so printed. But it has since been discovered that the representation made by the Sheffield corn dealers, who say that they are ordinarily excluded from Liverpool because of the high charge is correct, and that the rate is not 12*s.* 6*d.*, as we had printed it, but 15*s.* They have sent a letter or a copy of a letter from the station master at Sheffield, showing that the rate is really 15*s.* and not 12*s.* 6*d.* I have stated the fact in a marginal note in this paper, which I beg to hand in.

223. Who stated that it was 12*s.* 6*d.*?—Mr. Mason, of the London and North-western Railway Company, did us the favour to correct the figures contained in this paper, and in the corrections made he altered the rate that we put down at 15*s.* to 12*s.* 6*d.*; but we have since discovered that that rate is 15*s.*, and not 12*s.* 6*d.* No doubt it was some oversight, or unintentionally done.

224. (*Mr. Glyn.*) The stationmaster at Sheffield being the stationmaster of another company?—No; I believe he is the stationmaster of the Manchester, Sheffield, and Lincolnshire Company. I believe it is possible that there may be a difference in this way, although it might not readily occur to you; but I am told that by sending goods in the first instance from Liverpool for Sheffield to Manchester, and breaking the journey there, and then forwarding the goods to Sheffield, they can be carried at a lower rate than the direct rate would be that was charged from Liverpool. I am informed that that can be done. It is a thing that we should not have suspected, but I am told that it is the fact. Possibly there may be some reconciliation of the figures in that circumstance.

225. Do you know by what route the goods would go, on which company's line, and to what station?—The Manchester, Sheffield, and Lincolnshire Company who carry now by way of Garston.

226. Is that the station where the lower rate would be charged?—Yes; I believe that by sending goods to Manchester, and breaking the journey there on the same line of railway, and booking them again for Sheffield, they can be taken at a lower rate than if they were taken direct from Liverpool.

227. With whom would the contract be made at Liverpool?—With the same company, the Manchester chester, Sheffield, and Lincolnshire Company.

228. (*Mr. Horsfall.*) Do the corn dealers in Derby and Sheffield, for instance, complain that in ordinary times they cannot buy corn in Liverpool, owing to the high rate of charge for the carriage?—Yes; and that is one of the express cases to which our attention was called by a corn dealer in Sheffield, who noticed that some agitation was going on in Liverpool upon the question, and he wrote to his correspondent in Liverpool to say that he hoped the Chamber of Commerce in Liverpool would not overlook the case of Sheffield. He says, what is quite true, that Liverpool does suffer by wanting Sheffield as a customer, and that they suffer by wanting an access to Liverpool. A dealer in Derby, who is in the habit of attending our market, stated recently to one of our largest factors in Liverpool, that he was unable to buy a parcel of Indian corn that he offered to him, because it would cost him 3*s.* a quarter to carry it from Liverpool to Derby, whereas he could carry it at the rate of 1*s.* 6*d.* from Gloucester, the distance between the places being nearly the same.

229. Is it the fact that other inland towns, not having other ports available, must pay much higher prices for their produce, owing to the extra cost of carriage from the Mersey?—It is necessarily so, because they have not access to other ports.

230. Will you mention to the Commission some of the towns so situated?—Todmorden is one; that is a large consuming district.

231. (*Mr. Glyn.*) Can you state the rate charged between Liverpool and Todmorden?—Yes; it is 9*s.* 10*d.* a ton for a distance of 40 miles.

232. (*Mr. Horsfall.*) Is it the fact that merchants in Liverpool, from having certain places closed against their produce, have very frequently to warehouse their goods at a great cost, and to wait until a demand arises for them?—Yes; I attribute largely the large stocks which are frequently warehoused in Liverpool, to the want of cheap communication with the inland towns.

233. Have you made any calculation of the actual increased cost per annum on bread stuffs, owing to the heavy rates charged from Liverpool?—I have; I think that ordinarily the increased cost upon the importations to Liverpool on bread stuffs is about 150,000*l.* per annum, probably 200,000*l.* if we calculate the warehouse charge.

234. That would, I suppose, fall upon the consumer?—Yes; it must necessarily fall upon the consumer ultimately.

235. Have you entered into any calculation as to cotton?—Yes; my calculation as to cotton and cotton goods, taking what I conceive to be a fair rate, would be that it amounted to about 100,000*l.* per annum.

236. (*Mr. Roebuck.*) That cost arising, if I understand you rightly, merely from delay?—No; it arises from the extra charge made over and above what would be a fair charge for the conveyance of those goods.

237. (*Chairman.*) That has nothing to do with the detention at Liverpool?—No; when I spoke of 150,000*l.* I spoke of the direct charge, and meant to

say that that might be increased to 200,000*l.* if we calculated the expense of warehousing and also the delay.

238. (*Mr Gower.*) Is cotton taken to any other ports in England ?—Yes ; it is taken to London.

239. Is it taken to any other ports ?—Not to any important extent ; a little is taken to Glasgow ; but after all Liverpool is the great cotton port, and next to that comes London ; indeed London has only recently become of importance since cotton grown in the East Indies has been sent so largely to this country.

240. (*Mr. Horsfall.*) Are you aware of any special arrangements being made by the various railway companies, giving to certain individuals a preference over others ?—I am not personally aware of such; but from observations which have been made to me by customers of my own as to the advantages which they enjoy in forwarding goods in particular ways, I have been led to the conviction that preferential arrangements do exist and are made.

241. (*Mr. Glyn.*) Have you any idea what the character of those arrangements is ?—In two cases that are just now before me, I find that in the cases of Rochdale and Todmorden the charge is, in one case, to Rochdale 8*s.* 10*d.*, and to Todmorden 9*s.* 10*d.* to millers, whereas other dealers, grocers, and other persons in the same place, for the same goods, are charged 11*s.* 4*d.*

242. I suppose there is some little difference in those cases as to the quantities carried ? — Very possibly.

243. There is probably a contract for a certain quantity to be carried ?—Yes ; possibly there is. I am also informed as to the sugar trade, that a higher rate is charged to the grocers in Manchester than is charged to the sugar refiners, that is to say, that the raw sugar is carried at one rate and the refined sugar at another rate.

244. (*Capt. Galton.*) The article is not the same ? —So far the same that they are, as nearly as possible, equal value, weight for weight.

245. Might not damage be done more easily to one than to the other ?—Not much more easily. I think the difference would be almost inappreciable ; but in regard to that, I may mention that the rate on treacle is the same as that upon sugar, although treacle is the less valuable article of the two.

246. (*Mr. Roebuck.*) The difference, I suppose, is made on account of the person and not of the thing ? —On account of the persons or the classes.

247 (*Capt. Galton.*) Can you give any instances of a different rate being charged to different individuals for the same service rendered, so that one miller, for example, could not attain the same advantage that another could ?—I do not know of any specific cases in which it is so ; but I believe a system of discounts prevails which is a very elastic system, and not capable of being easily brought to the test.

248. (*Mr. Horsfall.*) That is your thorough conviction ?—Yes. One cannot get to know the exact facts from the persons who are best acquainted with them.

249. (*Mr. Hamilton.*) Do you mean that discounts are allowed by the railway companies ?—Yes, discounts off the rates which are printed in their schedule of charges.

250. Do you mean capriciously allowed ?—Yes.

251. (*Mr. Roebuck.*) Would not prompt payment be a good ground for obtaining a discount ?—I think not. All carriers by sea and land have it in their power to require prompt payment if they have any doubt as to the solvency of the parties.

252. (*Mr. Lowe.*) Have they not a lien upon the goods they carry ?—Yes ; and not only on the goods for the then present charge but for all other charges that may be due to them.

253. (*Mr. Glyn.*) Prompt payment is the rule, is it not, except in the case of coals ?—Yes, so I understand it.

254. (*Mr. Lowe.*) Have you any reason to suppose that there is any favouritism shown to certain persons in these varieties of charges, or is the variation regulated by any principle ?—I think it is regulated by some principle but I cannot tell you what that is. I think however, that it leaves it open to favouritism.

255. (*Mr. Horsfall.*) Are you aware of any railway companies deviating from what might be considered their natural province in constructing railways and carrying on the business of railways, by spending their money in the construction of docks with the view of diverting goods from their natural channel ? —Yes ; I know that railway companies have largely entered into the business of dock proprietors, steamboat owners, and warehouse owners.

256. Can you mention any instances ?—Yes. In the case of Hartlepool there has been a large expenditure made there by the railway companies for these purposes as I understand, (I state it on the information of the Chairman of the London and North-western Company) in the building of warehouses for the Port of Hartlepool. Goods are carried from the east coast in rivalry with the port of Liverpool, for example, at lower rates than they are caried from Liverpool.

257. (*Lord Stanley.*) That is to say they favour their own port by giving exceptionally low rates ?— Yes ; and not only so but they expend large sums of money in providing warehouse accommodation.

258. Provided they give equal accommodation at equal rates along their line, I presume it is not a matter that would concern you or the mercantile community in general whether they expended a part of their capital in constructing docks and erecting warehouses ?—Not if they carried for us at the same rates. It would then be a case for their own shareholders.

259. (*Mr. Glyn.*) I believe that the London and North-western Company do not run to Hartlepool ?— They tell us that they do not run there, but that they have a traffic from there. Certainly they have spent their money for the encouragement of that traffic.

260. (*Capt. Galton.*) In what way do you mean ? —Mr. Moon informed me that it was in building warehouses. My previous information was, that it was in the construction of docks and warehouses, but he stated that it was exclusively in the construction of warehouses, and of course his authority is paramount.

261. (*Mr. Horsfall.*) How are those docks made to pay ?—I do not suppose that they are ever intended to pay. It is the traffic upon the railway, they say, that will bring to the shareholders any return at a rate remunerative for the company to make the docks.

262. If the London and North-western Company have not a line to Hartlepool, how have they the means of promoting traffic on their line of railway ?— I cannot tell you what the arrangements are to get the traffic through the port, but I give you the answer that Mr. Moon gave to the objection that was made, that they carried traffic from the port although they had not a line.

263. (*Lord Stanley.*) Is it not the fact that any traffic which they may have at Hartlepool must go over 100 miles of lines unconnected with them ?—I cannot say whether or not that is so, for it is really very hard to know what companies such a company as the London and North-western Company is interested in.

264. (*Capt. Galton.*) How does it affect your traffic that they should be able to obtain traffic from Hartlepool ?—Only in this way, that it is carried at a lower price.

265. Lower than you would pay for the carriage from Liverpool ?—Yes.

266. Is it not possible that the conveniences for putting the traffic on to the railway at Hartlepool may be greater than the conveniences which exist at Liverpool ?—That does not touch the question of convenience from one point to the other. I contrast the rates charged from the company's station in Liverpool with the rates charged from Hartlepool. No convenience enters into the question in that case.

267. Can you give any other illustration of this system besides the case of Hartlepool ?—Yes ; Morecambe, which is used by the Midland Railway Com-

Mr. J. Patterson.

24 March 1865.

pany for the purpose of carrying at lower rates than those from Liverpool.

268. (*Chairman.*) The Midland Company have no station at Liverpool, have they ?—Not at present; but they are seeking for powers to come there.

269. (*Mr. Glyn.*) The traffic to Morecambe is very small, is it not ?—No ; there is a very important traffic to Morecambe from the north of Ireland.

270. (*Capt. Galton.*) Of what kind is the traffic ?—The traffic is in butter, in wheat, in oats, oatmeal, and in cattle chiefly.

271. What difference in the rate charged is there between Morecambe and places at equal distances as compared with Liverpool ?—From Morecambe to Manchester the distance is 56 miles, and the rate is 8*s.* 4*d.*, while at the same time the rate from Liverpool to Manchester, which is a distance rather under 32 miles, is 8*s.* 4*d.*

272. (*Mr. Horsfall.*) Your complaint is that the heavy charges out of Liverpool upon corn and other produce are unjust to the merchant, and that they throw a heavy tax upon the country ?—Decidedly. I should like to add to the case of Morecambe the case of Fleetwood, which is also a railway port, and there a large trade has been promoted from the north of Ireland. Steamers run daily each way, and the Lancashire and Yorkshire Company have recently sought and I believe have obtained powers to expend 50,000*l.* in the construction of docks there. The London and North-western Company have with them a common interest in that port.

273. (*Mr. Glyn.*) The London and North-western Company are not parties to that outlay, are they ?—I understand that they are to join in it to a small extent. I believe they participate to the extent of two-thirds and one-third. I know that the Lancashire and Yorkshire Company have agreed to expend 50,000*l.* upon the condition that no interest is to be charged for the money advanced by the railway company or companies until all other parties are paid 6 per cent. upon their outlay. There again the rates for a greater distance are nominally the same as the rates from Liverpool.

274. (*Mr. Roebuck.*) What do you mean by the rates being nominally the same ?—I mean that there are services performed at these ports in the shape of loading and unloading, and exemption from dues and various things which bring the charges there much below the rate charged from Liverpool, where those charges must be borne by the merchant; the services being performed by the railway company the amount must form a part of the ostensible charge which they make for carriage.

275. (*Capt. Galton.*) Are not the conveniences at Morecambe for loading and unloading greater than are to be found at Liverpool, and is not that one reason why the charge made is different ?—They are decidedly greater, but that cannot be a reason why the charge should be lower, as we have no service of the kind performed. When a vessel discharges her corn, or a steamer from Ireland, butter for Manchester, or for a merchant in Liverpool who sends it on to Manchester, he has to take it up at the dock side, cart it to the railway station, and deliver it to the railway officials, and they charge him the same amount that the parties charge from Fleetwood where no such service is necessary.

276. (*Mr. Dalglish.*) The railway comes nearer to the vessel at Fleetwood, does it not, so that there is economy in the working ?—Yes ; there is economy in the working of it, but none as regards the railway companies ; it is a service that in Liverpool they do not perform.

277. (*Capt. Galton.*) Can you give the Commission any instance of the rates charged as between any two places, showing all the charges made at Liverpool and and all the charges made at Fleetwood ?—The point that I wish to put is that their present rates are identical, say 8*s.* 4*d.* a ton, or they where when this paper was printed, from Liverpool to Manchester or from Fleetwood, or from Morecambe to Manchester.

278. Take Fleetwood ; are there any other charges made beyond the amount you have mentioned ?—No ; all the charges are borne at Fleetwood.

279. Are they all included in the 8*s.* 4*d.* ?—Yes.

280. The charge for unloading the goods and putting them on to trucks and transferring them from the vessel to the railway ?—Yes.

281. The whole expense of that operation is included in the 8*s.* 4*d.* ?—Yes.

282. And you say that they charge the same rate at Liverpool when they do nothing of the sort ?—Precisely the same.

283. (*Mr. Glyn.*) In the one case it is a charge from the seaside, and in Liverpool it is a charge from the station ?—Yes.

284. (*Mr. Horsfall.*) What is the difference in the mileage ?—From Fleetwood to Manchester the distance is 50 miles, but from Liverpool the distance is under 32 miles. Again, at Holyhead the London and North-western Company have necessarily great privileges.

285. (*Lord Stanley.*) Have they practically a monopoly of access to Holyhead ?—Yes ; practically they have, and they are by way of Holyhead diverting a large portion of the Irish traffic, which would go in the other direction.

286. From what other place would it go ?—Diverted from Liverpool to Holyhead; I do not say that they have constructed docks at Holyhead, for I believe the nation has done that for them, but they are making at Greenore, which is a point near Dundalk in Ireland, a harbour, and from it they are constructing a railway connecting with the Irish trunk lines with a view to divert the traffic to Holyhead.

287. (*Chairman.*) Does Greenore belong to the London and North-western Company ?—I believe they have become possessed of it, or at all events some persons who represent their interest there, I believe that the company who own it, consist in reality of some of the Directors, and other representatives of the London and North-western Company, at least that is the information which I have received. I believe that Mr. Bramley Moore and a number of other gentlemen went over to hold their annual meeting at Dundalk a short time ago.

288. (*Mr. Glyn.*) Are you not referring to the Irish North-western Railway Company ?—It may be so called ostensibly, but in Ireland it is treated as the London and North-western project, and I could hand in a letter that was received from an Irish gentleman, addressed to the Chairman of the London and North-western Company, giving his views upon the construction of that railway, and as to its influence on Irish traffic.

289. (*Mr. Roebuck.*) How is all this a grievance to the public ?—The observation that I would make with regard to that is, that a large proportion of the earnings made in places like Liverpool, where there is a large and profitable traffic, and where it is unduly weighted by these high charges, is diverted by making these experiments in railway enterprise, and pushing further extensions into new places, such new projects, for instance, as Hartlepool, Holyhead, Morecambe, Greenore, and so on. They necessarily reduce the income, that the railway companies earn, and I know, as a man of business, that we are frequently met with this remark :—"After all the companies are only earning "six or seven per cent." It occurred to us, in preparing a statement of our case, that we might fairly call attention to such unprofitable expenditure, as a reason why the whole revenue or income of the company was reduced beyond what it would normally be. One reason appears to us to be very plain, that these fancy schemes possess no value, we know that when they are made they are absolutely of no value, unless traffic can be forced to them, and the traffic that is forced to certain places, is so forced to the disadvantage of other established trades, and we in Liverpool, suffer accordingly.

290. (*Mr. Horsfall.*) Also to the great cost of the public?—Eventually it must be to the great cost of the public.

291. (*Sir R. Hill.*) The construction of these railways I presume is not carried out without parliamentary authority?—No; they cannot be made without parliamentary authority being obtained.

292. (*Capt. Galton.*) To what towns or places is the traffic carried between the place in Ireland which you mentioned which goes by way of Holyhead, and which formerly went by way of Liverpool?—I believe that a large proportion of the traffic will go into the midland districts, but even from Manchester itself, goods are proposed to be carried over that line from Holyhead, and in that way to Ireland.

293. But to whom does the conveyance between Greenore and Holyhead belong, and to whom does the conveyance between Greenore and Liverpool belong?—There is no conveyance between Greenore and Liverpool. It is intended to be in rivalry with the conveyance from Dunkalk, Newry, and Dublin, those ports having already steamers established that run to Liverpool.

294. In whose possession are those steamers?—They are in they possession of Irish traders and other private individuals.

295. Who are the persons who possess the steamers running between Greenore and Holyhead?—The London and North-western Company, are the persons who ostensibly occupy the position of proprietors of the line and of the harbour.

296. (*Mr. Glyn.*) Do they possess the steamers?—Decidedly.

297. Do you not refer to the Dublin Steam Packet Company?—I believe that they propose to make contracts; but they have the power to own steamers.

298. (*Capt. Galton.*) Does the London and North-western Company give a through rate from Greenore to some places in the midland district?—To any place that the parties wish to send goods to, as I understand it.

299. Then they get a through rate from Dundalk to Liverpool?—I believe that they have through rates.

300. Do those through rates differ from each other?—I cannot tell, for it is very hard to get at the through rates; but that does not meet the whole case, for a large portion of the Irish trade is not negotiated directly between the Irish shipper and the English consumer, but it has hitherto passed through Liverpool. Butter I mean and various produce have been sold by merchants and factors in Liverpool to the people in the interior engaged in that trade, and of course the traders in Liverpool would be deprived of that, or of any access to it, because it will be carried past them.

301. (*Mr. Horsfall.*) Are there any other general observations that you wish to make to the Commissioners?—I do not know that there is any other particular matter that I care much to trouble them with, except it be the grievance of those excessive charges of which we complain. The first item is the increase of cost to the consumer. Secondly, that they entail charges and loss upon the importers, when they are deprived of their market. Thirdly, they raise up these rival ports. Fourthly, they admit of opportunity for preferential privileges. Fifthly, they impose taxation in the article of grain of at least 50 per cent., upon the corn duties. Now when the prices are very low they may not press with any very great severity; but yet, if, unfortunately, we should have years when we should require a large importation of corn, and when the prices would be in consequence raised, they would be added to and greatly enhanced by the additional charges made upon the transmission.

302. (*Mr. Roebuck.*) That is, assuming that it came through Liverpool?—Yes; which is the great port for the importation of foreign grain for the Lancashire district.

303. (*Mr. Hamilton.*) Do you think that it would promote the interests of Liverpool if increased railway accommodation were given to that port?—Yes; I believe that Liverpool can very well afford to have some more railway accommodation. *Mr. J. Patterson.* 24 March 1865.

304. To be provided by independent companies?—There is a difficulty there as to where the independent companies can be found.

305. You mean that they are likely to combine?—Precisely.

306. That is only possible within certain limits, I suppose?—Captain Huish, when he was asked the question as to the chances of an independent line being made between Liverpool and Manchester, said that it was impossible, for it must either be run off or bought off. At the present time there is a combination between the existing railway companies and the canal carriers by which uniform rates are charged, and therefore any independent company that might attempt to come there would find itself in this position, that it must either encounter the hostility of a united body or agree with them upon the charges that would be satisfactory to them as well as to itself.

307. Is not the facility for combination very much increased by the disproportion which exists between the railway accommodation and the enormous traffic which companies have to carry?—No doubt it is so.

308. Therefore it would be a benefit to Liverpool if the railway facilities were increased?—I should say it would at present, but of course it must be borne in mind that facilities might be increased beyond what the trade would pay and so necessitate the imposition of extra charges. Still I do not think that we have arrived yet at that point.

309. (*Mr. Roebuck.*) Your suggestion is that the mischief of which you complain arises from combination; but what legislative cure for the evil are you prepared to suggest?—I must say that it is very difficult to suggest a legislative remedy because one has to deal with such very large interests; for example, one of the companies represents a capital of over 20,000,000*l.* sterling, and I am afraid that it would require something like a national scheme of legislation on the subject to meet the whole question.

310. (*Lord Stanley.*) Without that you think that a large company would crush a small opponent and combine with the more powerful ones?—They would crush any ordinary opposition that might be given to their schemes; for example, I believe there is a remedy that possibly Liverpool might appeal to as to the line between Liverpool and Manchester, and I think that possibly the assistance of some of the courts of law or equity might be invoked if we had not such powerful opponents to deal with, as I believe that the legislative provision made for the protection of trade has been entirely disregarded and ignored.

311. (*Mr. Roebuck.*) To decide such a matter in the law courts would probably require a capital nearly equal to that of their opponents?—I do not suppose that it would exactly require an equal capital, but it would require a larger sum than any voluntary combination of traders could raise unless there were other important public bodies who would take up the question.

312. (*Mr. Gower.*) Would a new line, do you think, receive the support of Liverpool at large?—No.

313. Would it receive very general support in Liverpool?—It would receive. I have no doubt, considerable support, but there are very large existing interests in connexion with the present companies.

314. Your opinion is, that with that support a new company could not compete with the existing companies?—I have no doubt they could compete, and to their advantage, but I do not think that they would compete so as to give such a reduction of rates as we seek for.

315. (*Chairman.*) You have already three lines, have you not, between Liverpool and Manchester?—Counting the line by way of Garston we have, but it is not a very direct one, and not very useful. The

Mr. J. Patterson.

24 March 1865.

London and North-western Company have got a very considerable hold over it.

316. (*Mr. Glyn.*) Have they not a Bill in Parliament this year for the purpose of increasing their accommodation in Liverpool?—I believe they have.

317. (*Mr. Horsfall.*) Your apprehension, I think, is that although a new company might be formed, yet in the end they would necessarily combine with the others?—Yes; and I will, if you will permit me, give another illustration of that. I find on reference to Mr. Baines' History of Liverpool, that somewhere about 42 or 43 years ago complaints were made by those engaged in my trade as to the excessive rates charged from Liverpool to Manchester, and they applied to the Duke of Bridgewater's agent for a consideration of and some redress for their grievance. The result was that they received as civil an answer as we have received from the railway company, but no redress. The consequence of that agitation was, that an application was made to Parliament for powers to make a line between Liverpool and Manchester, and I believe that that lies at the bottom of the railway system there. I mean the complaint that was made of the excessive charges made for the carriage of grain from Liverpool. That line was promoted by gentlemen of great public spirit, great honour, and great integrity, and who possessed a large amount of the confidence of the people of Liverpool, but in the course of the last 30 or 40 years circumstances have become very much changed, and it has been found that instead of protecting the public the company has been either forced or has been induced to enter into combinations with the same canal interest in order to keep up the excessive charges, and the legislative provision which was intended to protect the trade has been entirely disregarded.

318. (*Capt. Galton.*) Are not the rates charged much lower now than they were at that time?—I understand not; not at all lower in proportion to the improvements made as to communications in various ways; not certainly as low in proportion to the cost.

319. When the Amalgamation Bill was passed for amalgamating the London and Birmingham, the Grand Junction, and the Liverpool and Manchester lines, was not the scale of tolls considerably reduced?—I believe that when the London and North-western line was formed there was some reduction made in the scale of tolls; and I would just like to say, as to the scale of tolls appended to their railway bills, and even those in the Bills now before Parliament, that they are not of the slightest value for the protection of the public.

320. In what way do you mean?—First of all they entirely ignore the terminal charges or they treat us in this way, they say that "a reasonable sum" is to be charged. Now a reasonable sum in the hands of a railway company means anything. If in addition to the fixed tolls which Parliament introduced into the Bill they had also introduced fixed terminal charges, then one could understand it, but as they only put in the expression "a reasonable charge," we never know what the charge is to be.

321. (*Mr. Glyn.*) Do the terminal charges vary much in the same place; are they not fixed as between different railway companies, and made from year to year the same?—I believe that they are susceptible of very simple calculation, and that they could easily be embodied in Bills.

322. Are the terminal charges from time to time varied by the railway companies?—Not to any appreciable extent; certainly not more than the mileage charge would vary.

323. Can you refer me to the examination of Captain Huish before a Committee of the House of Commons, which is mentioned in the paper you have handed in, where he talks about 2*s.* being a general terminal charge?—It was given before the Committee which sat upon a Bill promoted by the Manchester, Sheffield, and Lincolnshire Company in the year, I think, 1861; I was present, and heard the question put to him.

324. (*Chairman.*) Are the Parliamentary tolls evaded in any other way than by excessive terminal charges?—It is impossible to say whether or not they are; for example, in the article of sugar carried from Liverpool to Manchester, it would be charged for at a mileage rate of 6*s.* 6*d.* per ton; it is charged 9*s.* Whether or not the railway company count 2*s.* 6*d.* or 1*s.* 6*d.* for terminal charge I cannot say, probably they would say that their calculation for the terminal charge was 2*s.* 6*d.*, but with such an elastic element in the calculation as the words "reasonable charge," it is, I think, apparent that you cannot determine in any given case whether they have or have not exceeded their tolls. I should like to point out as to mileage this difference, that in most railway Bills distances under six miles are to be so computed, that is, as six miles, while any distance above that is calculated at a uniform rate. But we know by experience of railways, and by the charges they make, that they do not carry for 10, 15, or 20 miles at the same rates as for 50, 60, 80, or 100 miles. Although the Parliamentary toll may be right enough for a distance of 10 or 12 miles, it is wholly useless when it is applied to a distance of from 24 to 50 miles or upwards.

325. (*Lord Stanley.*) Do you mean that the charges are above or below the Parliamentary rate for the longer distances?—For long distances the companies necessarily charge a rate much below what Parliament authorizes them to charge, because otherwise the public would not stand it, and it would stop the trade.

326. As regards the longer distances, they have practically a discretionary power?—Absolutely; for example, I will refer to a tariff which the corn trade prepared as to this very question. We endeavoured with such information as we could avail ourselves of, to fix a rate that we thought would be reasonable with reference to all parties, and we took a distance under six miles, which Parliament usually treats as six miles, that is the way they deal with it; and we took next a distance of under 12 miles, then a distance under 24 miles, under 48 miles, under 96 miles, and over 96 miles. The calculation that we made was, that while for 48 miles or over 1*d.* was a reasonable rate, if the distance was under 12 miles it ought to be $1\frac{1}{2}d.$, if under 24 miles it should be $1\frac{1}{4}d$, and if under 48 miles $1\frac{1}{8}d.$ Parliament, in dealing with such a case as that, has authorized the railway companies to charge from 2*d.* to $2\frac{1}{2}d.$ over all distances.

327. (*Mr. Glyn.*) But practically the railway companies do not do that?—No; unless it be for such a distance as six or eight miles. So that the Parliamentary tolls, as we believe, give no security that the public will be protected at all, unless the rates charged are made to graduate according to distance, and unless the terminal charges are distinctly stated and fixed.

328. (*Mr. Dalglish.*) How much do you pay from Liverpool to Manchester?—The rate was 8*s.* 4*d.* per ton until recently, when the company made some concession. They alleged truly that in Manchester they provided warehouse accommodation for three months, and in some instances for six or 12 months, without any charge to the parties using it, and that that formed an element in the charge of 8*s.* 4*d.* a ton. The answer of the corn trade was, we do not want you to provide warehouses at all, but do you charge for them as warehouse owners; and eventually, after a long conflict, and several interviews with the directors, they agreed to fix the rate at 6*s.* 8*d.* a ton, as applicable to those persons who removed their goods within 48 hours, 7*s.* 6*d.* per ton if the goods were removed within one month, and 8*s.* 4*d.* per ton if they remained in the warehouse for a longer period.

329. (*Mr. Glyn.*) That including a charge made for warehouse room?—I suppose so, that the goods were to pay.

330. (*Mr. Dalglish.*) That amounted to 10*d.* a ton for warehousing for a month?—I am not sure whether that was the charge for one month or two months;

but it was for a short period, I know, as to the 7*s.* 6*d.*, and the 8*s.* 4*d.* was charged if the goods remained for a longer period.

331. How much do you calculate per ton in Liverpool for warehousing?—I think it would cost about 2*d.* per quarter per month, 9*d.* or 10*d.* a ton.

332. Then for one month the railway company would warehouse your goods for just the same price that you would pay in Liverpool?—It would be 2*d.* a week per ton, as near as possible. The railway company charges us 10*d.* for warehouse accommodation. I do not know whether they give the option of taking the goods away within two months, but I think it is so.

333. 6*s.* 8*d.* would give about $2\frac{2}{3}$*d.* per mile for carriage?—It is about that, I think.

334. The distance is 32 miles?—Yes, but in the calculations we made we preferred to calculate what we understood to be a reasonable rate for terminals, and to calculate the mileage rate apart from that, and at 1*d.* per ton per mile it is 4*s.* 8*d.*, at $1\frac{1}{2}$*d.*, it would be 36 pence, or 3*s.*, and 2*s.* for terminals, which would make it, according to our calculation, 5*s.*

335. By adding the 2*s.*?—Yes.

336. (*Chairman.*) You take 2*s.* for terminals as the basis in every case?—Yes.

337. (*Mr. Dalglish.*) The railway company has now reduced the charge to 6*s.* 8*d.*?—Yes.

338. (*Mr. Horsfall.*) And you want to bring it to 5*s.*?—Yes. We believe that if the stipulations contained in the Liverpool and Manchester Act were carried out the rate would be under 4*s.*, and that it would be the cheapest rate for carriage in the kingdom.

389. (*Chairman.*) Are the rates which you propose about what they charge on other portions of the railway system in the country?—They are about the same as the charges made on other lines, such as the Midland Railway, which is one of the best paying lines in the kingdom.

340. (*Mr. Hamilton.*) Can you give an instance in which the same charge is made on the Midland Railway?—Yes; from Birmingham to Gloucester, and also from Birmingham to Bristol the rate, for which is 8*s.* 10*d.* a ton.

341. Is that the charge made for corn?—Yes.

342. What is the distance?—90 miles. According to our scale it would come to 9*s.* 6*d.* The actual rate is 8*s.* 10*d.*

343. Is that the usual charge made on the Midland Railway, or is it an exceptionally low charge?—It is the usual charge; it is about the average, as I am informed by one of my customers who is very familiar with it. If the Commission will allow me I will just read a letter from a Birmingham corn dealer on this subject which was addressed to my firm last year. "The distance to Bristol is 94 miles," in the printed statement it is put down at 90 miles. "The distance "to Bristol is 94 miles, to Liverpool 96 miles. The "rate from Bristol is 8*s.* 10*d.* by rail, and 8*s.* 4*d.* by "canal; from Liverpool it is 12*s.* 6*d.* by both. This "low rate from the former place has induced the "formation of two new dock companies, hoping, as "their merchants say, to get a large share at least of "the steamer traffic between America and the midland "counties, as well as that of sailing ships of a class "that hitherto their docks have scarcely been able to "accommodate. It is not, however, of Bristol that "we complain, but of our present high rates of "freights from Liverpool. The midland line carries "from Bristol, which is one of the best dividend "paying lines in the kingdom, and this is about an "average of their rates; so that the companies "between here and Liverpool cannot say it will "not pay them to carry for the same rates. But if "they should refuse to do so most certainly a large "share at least of their traffic will be gradually "turned in the other direction. Trusting you will "lay the matter before them, and that for their own "interests and that of the port of Liverpool they will "at once see its importance, I remain, dear sir, yours, "&c." The substance of that letter was communicated to the Chamber of Commerce, and to the great carrying companies, at an interview which took place between them.

344. (*Mr. Dalglish.*) Would the freight upon grain from any foreign port be the same to Bristol as to Liverpool?—There is a large proportion of the foreign grain trade which comes from the Black Sea, and the vessels come either to Cork or to Falmouth for orders. The captains have no option in the matter, but they must proceed to the place to which they are ordered to go.

345. Supposing you sent an order to the Black Sea for grain, you would, I presume, pay the same freight whether you ordered the vessel to come to Liverpool or to Bristol?—If the vessel called for orders the freight would be precisely the same.

346. Do you know whether there is any difference in the charges made in the port of Liverpool upon a ton of grain, and the charges made upon a ton of grain in the port of Bristol?—I believe that they have converted Bristol now nearly into a free port, the town itself having assumed the charges of the harbour.

347. (*Mr. Roebuck.*) Would not that probably in part account for the divergence of the trade?—It would; but that is a divergence of which we should not in any way complain, because that is a thing that would probably arise from some natural advantages possessed by the place, or from the public spirit of the people. What we complain of is, the difference of expense incurred in the carriage from one place as compared with another.

348. (*Mr. Dalglish.*) You have just stated that Bristol has become nearly a free port. Do you mean to say that they do not charge anything at Bristol upon a vessel entering their docks?—I do not know what they charge upon vessels entering their docks; but I understand that a considerable portion of the charges made at Bristol, if not all of them, have been in some way assumed by the inhabitants themselves; however, I do not speak with any confidence upon that subject.

349. (*Chairman.*) In your opinion could any legislative measure be passed that would compel the two railway companies running between Liverpool and Birmingham and from Liverpool to Bristol to carry at the same rates?—I think that is quite within the competency of Parliament to provide that the charges made on all lines of railway in the kingdom shall be conformed to some reasonable standard. As I have frequently noticed in railway bills, Parliament has reserved to itself the power of making such regulations and reductions as for the interests of the public they may think necessary to make.

350. For example, that coal should be carried for 100 miles over every part of the railway systems in England at the same rate, on whatever line it was carried. Do you think it would be possible to effect that?—Quite possible.

351. (*Mr. Horsfall.*) And with justice to the railway companies, irrespective of the cost of the lines?—Yes; I think that the same principle has been already laid down by Parliament, when it provided that a certain class of passengers should be carried over all the railways in the kingdom at a certain rate per mile, and which is practically found to be the rate that is charged to everyone.

352. (*Mr. Dalglish.*) That is the maximum?—That is the rate that is charged, I believe, practically on nearly all the lines of railway in the kingdom; as I found, when I was making some calculations that I could as nearly as possible arrive at the mileage by taking the third-class fares as my guide.

353. Are the dock charges greater in Liverpool than in other parts, or are they not very high?—The dock charges at Liverpool are necessarily high, but I believe they are higher in some other places. I do not think that the dock charges press, in addition to the railway charges, upon the trade. Say we pay 1*s.* a ton in Liverpool for dock charges upon our goods, it is not reasonable, we think, that the railway com-

Mr. J. Patterson.

24 March 1865.

pany should lay 2*s.* or 3*s.* upon our backs additional; they do not pay them, but we do.

354. May not that be a fair reason for a new harbour being constructed at Holyhead?—It would doubtless be a fair reason why independent parties should construct a harbour upon commercial principles, to be paid by the dues levied on the vessels and goods using it.

355. Do you attribute a considerable loss of trade at Liverpool to the high rates which are charged by the railway companies running from Liverpool into the interior of the country?—Decidedly; causing as they do, a diversion of the trade.

356. You do not attribute any proportion of the loss in the corn trade to the fact of your dock rates and other charges in Liverpool being higher than they are at Holyhead or Fleetwood, or at Morecambe?—Decidedly; but when we come to Parliament to ask for a remedy or for a measure to rectify the mischief we ask them to deal with questions that appear to be within the competence of Parliament to deal with. For instance, Parliament cannot help us whether we get our goods carted in Liverpool or warehoused for nothing or not. If there are natural disabilities that we labour under we must, of course, submit to them, or we must endeavour to remove them in the best way we can; but when we ask for a remedy we ask for a remedy, not with reference to things not within the competence of Parliament to deal with, but for those things that are within their competence.

357. In the grain trade, for example, when there is a short stock of grain, do you not take every advantage of the markets and sell grain at as high a price as you can?—Yes, that is the natural working of it.

358. Then I presume you would not blame the railway companies running out of Liverpool, if they found that they could get a certain price for carrying, for taking it?—Decidedly not, if we had a fair competition rate. We have 150 corn merchants and corn factors in Liverpool, and the competition or higgling which takes place in the business settles the price; but if a small number of them combined together and said that they would only sell corn at a certain price, I should think that that would be a most dangerous thing for the community at large.

352. They would become regraters?—Whatever the name might be I think that they would be a most dangerous set of men.

360. There is no law, is there, against their doing so?—I do not think there is, it is quite unnecessary.

361. Would it not be a difficult matter to get 150 corn factors to combine together in that way?—I think we must eliminate about 140 or 145 of them.

362. Do you not think it would be better in Liverpool to try and get up some more railways?—To a certain extent it would be advantageous to us, if any reasonable number that we might get would not be in such a number that they would have the power of combination. In the case of steamers there can be no reason why Parliament should interfere, any man may run a steamer, but with railways it is different, for in the first instance no man can make one without Parliamentary authority; and secondly, there is a practical limit to the number of railways that can be run from any given place.

363. (*Mr. Glyn.*) You do not think that competition will keep the railway companies in order?—It cannot do so.

364. (*Sir R. Hill.*) When the number of the competitors is necessarily small, I presume you find in practice that you cannot rely upon competition to reduce the prices?—Yes.

365. (*Capt. Galton.*) You stated I think that you would charge a uniform rate for goods carried over all the lines in the kingdom?—Yes, over uniform distances.

366. You would apply that rule to all railways?—Yes.

367. You would not leave one company to charge anything less if they please?—I would not interfere with their discretion, if they reduced to all places alike.

368. Then where would be the difference between the state of things now and what it would be then, they have maximum rates and tolls, and they can charge up to those amounts, but that they do not do; that is apparent, most of them charge below the maximum, and some of them very much below it. You complain that the London and North-western Company charge a lower rate from Hartlepool to the same towns than they do from Liverpool; but how would your proposal alter that unless you prohibited them from charging any more than the sum you would lay down?—I should certainly not contemplate prohibiting them from making a reduction in their rates, if they dealt with other places, rival ports, and so on, on precisely the same principle. If for example, the London and North-western Company found that they could work profitably, beginning at 1*d.* per ton per mile, instead of 1½*d.*, I think they would have a perfect right to reduce the rate to 1*d.*; but I should say that they should reduce it over the entire system.

369. Then you would not allow them to charge any differential rate on any part of their system?—No, neither more to places than to persons.

370. (*Mr. Dalglish.*) You would not permit them to charge a lower rate on the Holyhead line than upon the line from Liverpool to Manchester over the same distance?—That is my view of it, with this exception, that the question of the terminal charges might be fairly I believe introduced by Parliament into every Bill, and that the special circumstances of each particular place might be considered. For example it might be competent to the London and North-western Company, when promoting a Bill, to give evidence that Liverpool was a place where they could work for 6*d.*, a ton cheaper, on account of the quantity of goods they had got to carry, than at some other place; and whereas the terminal charges from Liverpool might be 1*s.* 6*d.* a ton they might fairly charge 2*s.* for terminal charges at another place where they had a comparatively small traffic. If there were special circumstances which affected the terminal charges, I think that those special circumstances might fairly be made the basis of legislation in a particular case.

371. (*Mr. Glyn.*) Then you would vary the terminal charges?—Yes; if there were special circumstances, but I should require them to be strictly shown and proved.

372. (*Mr. Dalglish.*) You would fix a certain maximum terminal charge, and you would allow railway companies, under particular circumstances, to reduce that maximum?—Yes.

373. Would not that be in direct contradiction of your own principle, that you would have a fixed charge over every length of mileage on a railway?—No; I would have a fixed maximum, I take no objection to reductions.

374. You would not have a differential rate with regard to mileage, but you would be quite willing to have a differential rate as to the terminal charges?—Yes; if the parties could show special circumstances, which I think would be very improbable. The railway companies say that at Liverpool and at London they have excessive terminal charges, and I would give the parties concerned an opportunity to give any proof of the fact. At the present moment I dispute it, for I do not believe there is any reason why there should be any difference in the terminal charges; but I would give them every opportunity to prove that there was.

375. Would you allow this, that the terminus of the London and North-western Company in Liverpool has cost an infinitely greater sum than the terminus of the railway in Holyhead?—I have no doubt at all that it has cost a larger sum.

376. A very much larger sum?—Am I to under-

stand by the question that you mean in yards or in area, or in reference to the quantity of goods ?

377. I mean in the capital expended in the construction of the tunnel and the various stations in Liverpool, and on the other hand in the construction of the station at Holyhead ?—I do not believe that the station at Liverpool has cost the London and North-western Company more money per ton, having reference to the quantity of goods.

378. You would allow, I presume, that there was an enormous difference in the outlay ?—Do you mean in the area ?

379. No ; I mean in the outlay of capital for the station ?—No doubt.

380. Do you suppose that the Liverpool traffic is equivalent to the difference of cost in the two cases I have put to you ?—I am sure that it is more than equivalent.

381. (*Mr. Glyn.*) You would permit it to be shown by the companies if there were any very peculiar circumstances, and, if proved, you would allow them to vary the terminal charges ?—Yes, I think it would be very fair to allow them to show that there were such circumstances, but at the present moment I dispute it.

382. (*Capt. Galton.*) With regard to the rest of the charges, you would not permit any variation in the mileage rate ?—I have given an illustration of the mileage rate fixed by Parliament as to third class passengers, and which I think would fairly apply to all classes of traffic all over the country.

383. A mileage rate is already fixed for third class passengers all over the country, but you say that whatever a railway company charges on one part of its line they should charge the same over the whole ? —My proposal is this, that if Parliament proceeds upon the principle of fixing a uniform mileage rate for uniform distances they should proceed precisely upon the principle that they have adopted in all previous Acts where they have fixed tables of tolls ; but in fixing them they have not had information as to the cost, nor have they made any provision for varying distances. I think, then, that if a remedy is to be found in legislation in that direction, they ought in the first instance to fix a terminal charge, either a uniform charge for all lines, or, if special reasons could be given (although I do not believe they can), they might allow exceptions where exceptional circumstances were shown to exist. I think in the first instance that the onus of proof would rest upon those who said that there was a reason for an extraordinary charge.

384. You would make a mileage rate uniform all over the system ?—Yes.

385. Suppose that I am a manufacturer ; and that I go to a railway company and say, I can furnish you with a train load of goods every day at a fixed hour, would you permit that company to charge me a lower rate than they charged some one else who could only supply them with a ton of goods occasionally ?—No, I would not, for I believe that that is one of the most pernicious systems that is at present in use in railway concerns, that of making a distinction between different classes of customers.

386. (*Mr. Glyn.*) It is a distinction founded upon quantity and weight, is it not ?—I believe that that is an entirely erroneous distinction.

387. (*Capt. Galton.*) A certain company can work traffic much more economically than another, and if I supply them with a full train load of goods, and which they know will run at a certain hour every day between one place and another, could they not work that traffic much cheaper than when they had to wait to make up a train by receiving a ton of goods from one and a ton of goods from another ?—It is possible in such a case as you have put that they might be exempted from the terminal charge by loading, for instance, on the manufacturers' own premises, so that there might be a possibility of giving that person the advantage of the terminal charge.

388. (*Mr. Glyn.*) But it is not a question of terminal charges ; it is a question of the charges on the line ?—Yes ; but I think that differential charges are based on an erroneous principle. What railway companies now and all carriers are served by is the aggregation of littles.

389. Do you think that upon a full load there is not a greater profit to the company than upon half a load ?—I believe that, if the company had 100 small customers who all started their goods daily, the profits would be greater than if there were only five large customers.

390. The question is whether the customers will practically fill a particular train, and whether or not the arrangements as to a full train will not be more economical to the company, and therefore that they could carry at a lesser rate than if they carried only half a load in a train ?—I do not see exactly how that is.

391. (*Mr. Dalglish.*) For example, suppose you had ten customers in your own trade, and that they each bought from you a quarter of corn which you had to deliver to them ; then suppose that another person came and purchased 10 quarters of corn, and you had also to deliver them to the purchaser ; would you make no difference between the price you charged for the one quarter of corn and the price you charged for the 10 quarters ?—I believe that a shopkeeper who sells his goods over the counter will sell half a pound of tea or a pound of tea or two pounds of it at precisely the same price, and if you have a constant stream of traffic coming in, such as a railway company has, that would be better served by a large number of small customers than by a small number of large customers.

392. But the question is, the expense of delivering the 10 quarters of grain ?—If you had to send expressly to Liverpool those 10 quarters, then the question of economy or the want of it would come in ; but a railway company does not send away half a load, it allows the littles to accumulate until it makes up a full load.

393. That is what they do, but the question put to you was this, whether a train, say of 400 tons, going at a certain hour, and one customer filling the train, does not place the railway company in a better position than they would be in when they announce that they have a train to start at a certain hour, trusting to ten or a dozen customers to bring their goods to fill that train ?—The practical fact is that the railway company does not announce that they will start a train at any hour, but what they do is to make up a train of goods and carry them, but they give no information as to the articles, or as to the time when they will carry them, for they will keep them a day or two days or half a day until they are sent away.

394. (*Mr. Roebuck.*) I think what you mean is this : You would suggest a reduction of the maximum rates and you would impose a necessity upon the railway companies to charge for uniform distances a uniform rate ?—Yes, that would be, supposing that Parliament chose to deal with the subject in that particular manner.

395. (*Chairman.*) I think your view is, that not only one particular system of railways should charge a uniform rate, but that all railways in the country should have a uniform rate for equal distances ?—Yes, and I believe that that is a reasonable proposal. It would involve the necessity for having some administrative board that should take into consideration the question of proposed reductions.

396. Would not that practically put an end to competition ?—Yes, it would, but there is none at present.

397. (*Sir R. Hill.*) Your proposal, I think, is to have a general system of fixed terminal charges, and a varying mileage rate according to the distance—a lower rate for a longer distance ?—I should say somewhat lower than for a short distance.

398. Would not the same result be brought about by more simple means ; for instance, if you had a uniform mileage rate, whatever the distance might be, but a higher terminal charge, that terminal charge being so adjusted as to produce, in combination with a uniform mileage rate, about the same charge for a

Mr. J. Patterson.

24 March 1865.

given distance, 10 miles, or 20 miles, or 50 miles, as you have yourself proposed?—That would be a question of calculation.

399. No, it would be a simple arrangement, to have a fixed rate for terminal charges, and a uniform mileage rate whatever the distance travelled might be?—My apprehension of the case is, that the terminal charge is as nearly as possible a uniform amount, entirely irrespective of the distance, and therefore I would make it a fixed charge; but a mileage rate is subject to fluctuation, and I would make the fluctuation apply to it. The result would be arrived at I have no doubt by the same means, but it would be an erroneous phraseology. There is no reason why the terminal charge should be made different upon 100 quarters of corn whether it be carried 20 miles or 120.

400. I am suggesting that the terminal charge should be a fixed invariable amount?—Yes, that is my proposal.

401. And that the charge per mile should also be a fixed invariable amount. Then by raising or depressing the terminal charge, I do not mean on every occasion, but once for all, in the original enactment, you might bring out the same result as you aim at obtaining by a fixed terminal charge, and a varying mileage rate?—I think that that would be an inconvenient way of arriving at the same result.

402. (*Mr. Gower.*) In your opinion, are the rates which the railway companies connected with Liverpool now charge, rates which are most profitable to themselves, or do you think that by changing them, they might increase their own profits?—I have not the slightest doubt that the rates at present charged, are those which are supposed to be the most profitable to the company; I have no doubt at the same time that a judicious reduction of those rates would not infringe upon their profits.

403. (*Mr. Roebuck.*) If the high charges at Liverpool throw increased trade upon the lines in which they have an interest, may it not be for the real interest of the companies as opposed to the interest of the public to make a high charge from Liverpool?—It may be their supposed interest to do so, but I believe that selfishness is often very short-sighted.

404. Suppose that by making a high charge they throw increased traffic upon the lines in which they have an interest, may it not be for their interest to do so, although it may be injurious to the interests of Liverpool?—Yes, for a limited time; but if the Liverpool and Manchester Company, instead of having two lines from Liverpool to Manchester, many years ago had laid down four lines, and perhaps by this time six lines, and had reduced their charges, I believe that their shareholders would have been receiving a very large dividend upon a very largely increased trade from Liverpool, and they probably would have been saved from some very injudicious extensions in other directions.

405. (*Chairman.*) Are the docks at Liverpool capable of accommodating a greatly increased traffic over the present enormous amount?—At the time when the two articles of corn and cotton came in in large quantities, as they did in the year 1861, the dock accommodation was found to be very deficient; but large dock extensions are in progress, particularly at Birkenhead, extensions which at present are not profitable to the trade of Liverpool, but which probably will be found to be a profitable employment of capital at a future period.

406. (*Mr. Hamilton.*) Have you heard anything of a scheme for connecting Liverpool with Birkenhead, by running a tunnel underneath the Mersey?—Yes; we have seen it in the parliamentary notices.

407. Is that project entertained with favour at Liverpool?—I think it is; we should be very glad to see it carried out, but we think that it is almost too good to be true.

408. (*Mr. Horsfall.*) Is there any other observation that you would like to make to the Commission?—Yes; in reference to some of the questions which have been put to me as to the cost of construction, and as regards the terminus at Liverpool. I think that we might get an illustration as to the importance of cost in the case of a railway in Ireland that has been made at a cost of 5,000*l.* a mile as compared with another railway at Blackwall which cost above 120,000*l.* a mile. That Blackwall Railway has been carrying, and could carry, passengers with a profit at rates that would not be as remunerative to the Fynn Valley Railway. Another case has occurred to me as to the terminus at Liverpool. We have an insurance company in Liverpool called the Liverpool and London Globe Company, which has very extensive offices standing upon land which has been valued at about 50*l.* or 60*l.* per square yard, and I think they can insure persons as cheaply as if their land cost them as many shillings per square yard. I give these cases as illustrative of the opinion which I entertain, namely, that the actual cost of the construction of a railway or of a terminus may be comparatively of small moment with reference to a calculation of the charges to be made, for after all the main element is the amount of business done on the premises.

409. (*Mr. Glyn.*) Has there not been great opposition on the part of landowners in Liverpool to grant sites for stations, and so on?—No, I think not, if a proper price was offered; we have had so large a trade from Liverpool that the landowners have derived a very large harvest indeed in that way.

I have further to add that in the letter that I received from the corn dealer, and to which I have already referred, there is a postscript. "P.S.—"What makes the railways more difficult to deal "with between here and Liverpool is, that they "have the control of the canal tolls, and if any one "puts boats on they must do it at a loss. This is "not the case between here and Gloucester. Any "one can carry cheaper by their own boats, or by "hiring, than by railway." From Liverpool actual weights are charged for, as they should be elsewhere; 5 quarters are computed to the ton of wheat, thus reducing the nominal charge 10 to 15 per cent. With regard to the applications that have been made to the railway companies in Liverpool I may state that we have not only applied to the London and North-western Company, to the Lancashire and Yorkshire Company, and to the Manchester, Sheffield, and Lincolnshire Company, but also to the trustees of the Bridgewater Canal, as after an interview that we had with the chairman and with several of the directors of the London and North-western Company, it was suggested by the chairman that it would be desirable that we should have a conference with all of those gentlemen. He was good enough himself to call a meeting of those several companies, who appeared by a very large representation indeed; there were probably three or four directors of each of those companies. Mr. Faraday Smith and some of the officials were present on behalf of the Bridgewater Trust, and all these questions were discussed between us, and it was then understood that any redress that could be given for our grievances must be given by the united action of all those different bodies. We were afterwards informed that Mr. Faraday Smith, as representing the Duke of Bridgewater's Canal, was unwilling to give up the system of free warehousing in Manchester; but, whether with or without his consent, that principle has been to some extent given up, so that now we have a small but inadequate reduction in the rate from Liverpool to Manchester. But our case included the whole case that is made in this printed paper. With regard to any other portion of it we cannot say that we have obtained any redress.

410. What was the date of the conference?—It was a few months ago.

411. Is that the only rate that has been reduced to which you have just referred?—I believe that there is one in the neighbourhood of Manchester that has been reduced, correspondingly, but only one.

The witness withdrew.

Mr. Hilton Halhead examined.

412. (*Mr. Horsfall.*) You are a timber merchant at Liverpool?—Yes.

413. How long have you been engaged in that trade?—Forty-three years next month.

414. You are well acquainted with the timber trade at Liverpool and its requirements?—I am.

415. Is that trade continually in need of increased accommodation?—Yes, constantly.

416. Owing to the increased imports?—Yes.

417. The trade of Liverpool, I think, doubles itself in about every 14 years?—Yes, all the tonnage of Liverpool.

418. What is the present tonnage of Liverpool?—Nearly 5,000,000.

419. Has the timber trade largely increased?—It has, I think, in about the same ratio with the general increase at Liverpool.

420. Has the Baltic trade increased?—No; that has diminished, chiefly owing I believe to the very excessive rates which have been charged from Liverpool into the Yorkshire districts, as compared with the rates charged from Hull, Grimsby, and Hartlepool, which compete with us.

421. That is regarded as a grievance by the timber trade of Liverpool, is it not?—Yes, as a very serious one.

422. Owing to higher rates being charged from Liverpool than from those ports?—Yes, they are very much in excess, and we have had two or three meetings on the subject.

423. With which railway companies have you had communications?—With the London and North-western Company; with the Lancashire and Yorkshire Company, and I fancy with the East Lancashire Company, who have a portion of the Hull and Grimsby line running into Leeds and the other manufacturing districts.

424. Will you state to the Commissioners what amount of shipping is employed in the timber trade?—In 1822, when I first entered into the trade, there were 384 ships employed, which carried 100,620 tons. In 1860 that number was increased to 421 ships, which carried 298,498 tons. In 1863 the number was increased to 545, which carried 410,932 tons, and that is still going on.

425. Is it an opinion generally entertained by the timber trade in Liverpool that the tonnage would have been much greater had it not been for the high rates charged by the railway companies?—Yes.

426. Are you prepared with any statement as to the comparative rates charged at Liverpool and at other ports?—I am; I have condensed it a little. (*See Appendix E.*)

427. Just state the substance of it?—From Liverpool to Burton-on-Trent the distance is 90 miles, and the rate charged is 15*s.* a ton. From Hull it is 122 miles, and the rate charged is only 9*s.* 8*d.* From Hartlepool the distance is 154 miles, and the rate charged is 10*s.* 10*d.* From Bristol the distance is 125 miles, and the rate charged is 12*s.* From Gloucester the distance is 87 miles, and the rate charged is only 7*s.*

428. It is larger to Burton-on-Trent?—Yes. The next place is Derby; the distance is 92 miles from Liverpool, and the rate charged is 13*s.* 4*d.* From Hull the distance is 111 miles, and the rate charged is 9*s.* 2*d.* From Hartlepool I have not got the mileage, but it must be very considerable, above 120 miles, and the rate is 10*s.* 4*d.* From Bristol to Derby the distance is 136 miles, and the rate is 11*s.* 4*d.* From Gloucester to Derby the distance is 99 miles, and the rate is 8*s.* From Great Grimsby to Derby the distance is 94 miles, and the rate 9*s.* 2*d.*, and so on. Then there is Sheffield, which is distant from Liverpool 70 miles, and the rate is 11*s.* a ton. Then from Hull to Sheffield the distance is 70 miles, and the rate is 7*s.* Hartlepool is 8*s.* 4*d.* per ton, but there again I have not got the mileage. Staleybridge is 40 miles from Liverpool, and the charge is 10*s.* per ton. It is 110 miles from Hull, and the charge is 12*s.* 6*d.* a ton; also 12*s.* 6*d.* from Hartlepool. From Todmorden the distance from Liverpool is 50 miles, and the rate is 13*s.* per ton. From Hull to Todmorden the distance is 84 miles, and the rate is 12*s.* 6*d.* From Liverpool to Birmingham the distance is 90 miles, and the rate 13*s.* 6*d.* per ton. From Hull to Birmingham the distance is 134 miles, and the rate is 14*s.* 2*d.* per ton. From Hartlepool to Birmingham the distance is 180 miles, and the rate is 14*s.* 2*d.* From Bristol to Birmingham the distance is 94 miles, and the rate 10*s.* per ton. From Gloucester to Birmingham the distance is 56½ miles, and the rate is 6*s.* 6*d.* per ton. From Sunderland to Birmingham the distance is 208 miles, and the rate is 14*s.* 2*d.* From Liverpool to Penistone the distance is 63½ miles, and the rate 16*s.* From Hull to Penistone the distance is 89 miles, and the rate 10*s.* 10*d.* From Liverpool to Rochdale the distance is 41½ miles, and the rate is 11*s.* per ton. From Hull to Rochdale the distance is 88 miles, and the rate is 12*s.* 6*d.* a ton. From Hartlepool to Rochdale the distance is 138 miles, and the rate 12*s.* 6*d.* per ton. From Liverpool to Sheffield is 70 miles, 11*s.* From Hull to Sheffield 70 miles, 7*s.* From Hartlepool to Sheffield I have not the mileage, but the rate is 8*s.* 4*d.* a ton. From Liverpool to Manchester the distance is 31½ miles, and the rate is 8*s.* per ton. From Fleetwood to Manchester the distance is 50½ miles and the rate is 8*s.* per ton. From Hull to Manchester the distance is 99 miles, and the rate 12*s.* 6*d.* From Hartlepool to Manchester 103 miles, 12*s.* 6*d.* From Grimsley to Manchester 110 miles, 12*s.* 6*d.*

429. As representing the timber trade of Liverpool, you put in those various rates operating to the disadvantage of Liverpool, and that is the complaint of the timber trade?—Yes. I may just mention that in all instances except about three, are the rates out of Liverpool in excess of 12 rival ports to 22 places. Out of 264 places there is no charge in excess of those from Liverpool, except in three out of the total of 264, in which places the charge is in excess of the charge from Liverpool—261 cases against 3.

430. Which are those three places?—From Grimsby the charge is at the rate of $2\frac{1}{15}d.$ per ton to Halifax. From Liverpool it is $1\frac{2}{3}d.$ Another case is from Hull to Leeds, where the charge is $1\frac{4}{7}d.$ per ton. From Liverpool it is $1\frac{1}{2}d.$ From Hartlepool to Halifax the charge is $1\frac{5}{8}d.$ against $1\frac{2}{3}d$ from Liverpool. Those are the only three exceptions out of all the places enumerated in the list which I have handed in, and in those cases the rates are slightly in excess.

431. (*Mr. Hamilton.*) Does the table show on what particular lines those rates are charged?—Not entirely so, because there is an amalgamation in the case of some of them. The goods go perhaps upon two lines for the whole length of the distance, but we have got these rates from the parties who pay the rates. I have a letter here which was sent to me from Liverpool. I wrote before I left Liverpool to a gentleman to get me the particulars of the rates from Birmingham, and he says, "Agreeably with your request "annexed, I beg to hand you rates of carriage from "Gloucester, Bristol, &c. to Birmingham, and I am "pleased to see that some one is taking the initiative "with a view to get the Liverpool rate to our town "reduced, as it has for some years kept us out of "your market for American pine and spruce deals, "of which there is an enormous consumption here. "You will perceive that the Liverpool rate to Bir"mingham is half as much again as the Bristol rate, "and the distances, I believe, are nearly alike. "Hoping your efforts will meet with a successful "result, I am, Gentlemen, yours most respectfully, "Jesse Ball."

From Bristol, 91½ miles.

By water 8*s.* 6*d.* per ton, 2½ tons to standard.
By rail 9*s.* 0*d.* „ „ „

By rail 13*s.* 6*d.* per ton, $2\frac{1}{2}$ tons to standard.

Station to station rate.

432. (*Chairman.*) The trade from Liverpool with most of these places has become diminished, and you consider that you are placed in a disadvantageous position as compared with other towns ?—Yes ; the trade has very much diminished for Baltic timber, although as a whole it has increased. We consider our trade would have increased still further had a more equitable charge been made from the different rival ports, and that our rates ought to be less.

433. (*Mr. Roebuck.*) I suppose you consider yourself at a disadvantage with the eastern ports, you being on the western side of England, in your trade with the Baltic ?—There is a little disadvantage.

434. May not a portion of the falling off of your trade be attributable to that circumstance ?—I think it may, fairly.

435. (*Chairman.*) The Commission may infer, I think, that you are not prepared to give any opinion as to what would be the best remedy for the disadvantages under which you state you labour in Liverpool ?—We should like something in the shape of an equitable distribution of the rates according to distance.

436. But you are not prepared to give any evidence as to how that is to be accomplished ?—No ; I am not.

The witness withdrew.

Adjourned to Wednesday next at 12 o'clock.

Wednesday, 29th March 1865.

PRESENT :

THE RIGHT HON. THE EARL OF DONOUGHMORE.
THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
THE HON. E. F. LEVESON GOWER, M.P.
SIR ROWLAND HILL, K.C.B., F.R.S.
J. A. ROEBUCK, ESQ., M.P.
T. B. HORSFALL, ESQ., M.P.
ROBERT DALGLISH, ESQ., M.P.
CAPTAIN DOUGLAS GALTON, R.E., F.R.S.
E. T. HAMILTON, ESQ.
W. POLE, ESQ., F.R.S., *Secretary.*

THE RIGHT HON. THE EARL OF DONOUGHMORE IN THE CHAIR.

Mr. C. Stead.

2 March 1865.

Mr. CHARLES STEAD examined.

437. (*Chairman.*) I believe you are a member of the firm of Salt, Sons, and Company, of Saltaire, near Bradford ?—Yes.

438. What business do you carry on ?—We are spinners and manufacturers of alpaca and various other fabrics made from foreign and English wool.

439. Are your works at Saltaire ?—Yes.

440. What is the situation of your works ?—They are about three miles from Bradford. One end of the warehouse abuts upon the Leeds and Liverpool canal, and the other end of it abuts upon the extension line of the Midland Railway Company, called the Midland Extension Railway, by which we have access to Liverpool either by canal or by railway.

441. At the time when the erection of your manufactory commenced, did the canal belong to one company and the railway to another ?—That was so. When the buildings were commenced, I may say that I believe a lease was entered into in the first place between the different railway companies and the Leeds and Liverpool Canal Company, by which the tolls or water dues on this canal were leased ; and perhaps, prior to the works being commenced, other arrangements were made before we were aware of it.

442. Can you state to the Commissioners the names of the four railway companies ?—The Lancashire and Yorkshire Railway Company was one, the East Lancashire Railway Company another, the London and North-western Railway Company another, and the Midland Railway Company.

443. You had made arrangements to commence the erection of the buildings before you became aware of this arrangement ?—Yes.

444. Since that time has there been an amalgamation between the railway companies and the canal company ?—No, but the railway companies have raised the tolls upon merchandise carried on the canal.

445. So that those four railway companies have complete control over the traffic on the canal ?—Yes.

446. (*Mr. Horsfall.*) Do they all charge the same rate ?—Yes, both the canal and the railway companies have made them so now.

447. (*Sir R. Hill.*) Was the charge previously made by the canal company increased ?—Yes, it was considerably increased, as I can show the Commissioners. On the 3rd of August an agreement was entered into, at which date the dues per ton per mile were $\frac{3}{4}d.$ from Liverpool to Bradford, and on the 5th August following the dues were advanced to $1\frac{1}{2}d.$ per ton per mile.

448. (*Chairman.*) On what description of goods was that charge made ?—It was made on general merchandise, minerals were a little different.

449. In carrying on your business you have a good deal of traffic in bringing the raw materials to the works, and in sending away manufactured products ?—Not so much in sending away as in bringing the raw materials to the works.

450. Which are the places from which you principally obtain your raw materials ?—Liverpool and London.

451. Are you prepared with any statement or table of the rates which you now pay for the principal articles you require for manufacturing purposes from Liverpool and from London, also showing the rates which you formerly paid ?—I have no table, but I can state the rates. We now pay from Liverpool 18*s.* per ton, and before the works were commenced we had them brought to Bradford, which is four or five miles further by the canal, for about 17*s.* 6*d.*, and the rate has been as low as 8*s.* 4*d.*

452. That I suppose was during a period of competition ?—Yes.

453. Did that state of things last for any length of time ?—Not for any great length of time.

454. What rate do you pay to London ?—To London we pay 35*s.* per ton.

455. Is there an equal charge whether the goods are sent by canal or by railway ?—We have not a canal to London. We must have the goods sent by railway or by sea to Hull or to Grimsby, and from thence forwarded by railway.

456. With respect to the canal, were there formerly trading boats and carriers running on the canal ?—A great number.

457. Are there any at the present time?—I believe there are none, excepting those of the lessees of the canal, which now carry for those various railway companies. The Midland Railway Company, I believe, has now withdrawn from the agreement. The three others remain as the lessees of the canal, and they are carrying.

458. You do not mean in opposition to the Midland Railway Company?—No. The Midland Railway Company only goes for a distance of about 25 miles on the route to Liverpool. Then they go over the East Lancashire line, which is now amalgamated with the Lancashire and Yorkshire line, and they form one company.

459. (*Mr. Horsfall.*) What were the rates of charge between Liverpool and Saltaire before this combination took place?—We had not built the works before the combination.

460. What were they to Bradford?—To Bradford we paid 17*s.* 6*d.*

461. What did you pay afterwards?—Now we have an arrangement to Saltaire for 18*s.*

462. (*Sir R. Hill.*) Is the distance greater or less?—It is a less distance, four miles less, but I should not like to say exactly; the Bradford branch of the canal is one on which there are many locks.

463. (*Chairman.*) What is the distance from your works to Liverpool by railway?—114 miles, or about that.

464. (*Mr. Dalglish.*) And what is the distance from your works to London?—We have no canal carriage to London, but by railway it is about 210 miles.

465. (*Capt. Galton.*) To whom does the Leeds and Liverpool canal belong?—It is now leased by the East Lancashire Company and the Lancashire and Yorkshire Company, which are now amalgamated, and the London and North-western Company.

466. Your works are on the line of the Midland railway, are they not?—They abut on both.

467. That is on to the railway and on to the canal?—Yes. The Midland Railway Company have an extension branch from Skipton to Colne—it goes through Skipton.

468. Your goods go, when they are carried by railway, by the Midland line to Colne, and then by the Lancashire and Yorkshire Company's line to Liverpool?—Yes, it was formerly called the East Lancashire line. It was amalgamated with the other in 1859.

469. You have, as I understand, no access to the London and North-western railway?—No.

470. And no access to Liverpool except by passing over the Lancashire and Yorkshire railway?—No direct access; we have an access by way of Bradford and by the Lancashire and Yorkshire line proper.

471. You must pass over one or other line of the Lancashire and Yorkshire Company to get to Liverpool?—Yes.

472. There is no competition between the London and North-western Company and the Lancashire and Yorkshire Company?—None. The competition that we looked for was between the railway and the canal, and when Saltaire was fixed upon it was chosen especially with that view.

473. (*Sir R. Hill.*) Is there anything at the present time to prevent the carriers from conveying goods on the canal at the old rates?—Yes, there is, because the dues are so heavy as charged by the lessees, and it is impossible for them to do it.

474. Can you say whether the original Act empowering the shareholders to make the canal fixed a maximum upon the dues to be levied?—Yes, it fixed 1½*d.* per ton per mile.

475. And they have not exceeded that?—No, but the maximum was not charged before the arrangement was made with the railway companies.

476. (*Mr. Horsfall.*) It was about half, I think you say?—Yes. Only two days before the arrangement was made it was half, and then it was suddenly raised to the maximum.

477. (*Sir R. Hill.*) You do not complain that there has been any violation of the law?—No.

478. (*Mr. Horsfall.*) Consequent upon the arrangement between the railway companies and the canal company you now pay double the amount of carriage that you did before?—No, the dues are double, but we do not really pay double, because we have arranged with the Midland Company, and they again, I presume, have made their arrangement with the East Lancashire Company, whatever that may be, to get our goods brought to Saltaire for 18*s.* a ton.

479. (*Mr. Gower.*) How much would the rate be, supposing no arrangement to have been made?—That I cannot say.

480. (*Sir R. Hill.*) How much would it have been by the canal?—We previously got them carried at 17*s.* 6*d.* per ton, before the arrangement took place and it has been as low as 8*s.* 4*d.*

481. The charge has been in effect advanced from 17*s.* 6*d.* to 19*s.*?—Yes.

482. (*Mr. Horsfall.*) It has been increased in fact from 8*s.* 4*d.* to 17*s.* 6*d.*?—Yes.

483. (*Sir R. Hill.*) That was a temporary change, was it not, the 8*s.* 4*d.*?—Yes; but I have very little doubt but that if private carriers could carry on this canal at ¾*d.* per ton per mile lock dues as they did before the arrangement was made with these various railway companies; I have no doubt that we could get our goods at from 12*s.* to 14*s.* per ton.

484. Can you say how long that low charge which you have mentioned had been in operation?—Not precisely.

485. For a year or two?—I see by a memorandum that it continued until June 1850. It was 8*s.* 4*d.* per ton, but when that charge began I have no data to show.

486. (*Chairman.*) What was the rate immediately after June 1850?—On the 5th August 1850 the lock dues were doubled.

487. That was immediately after the arrangement that was made between the railway and the canal companies?—Yes.

488. If the Lancashire and Yorkshire Company and the East Lancashire Company had not been amalgamated in 1859, would you now have two different routes to Liverpool?—We should.

489. The one by Colne, and the other by Bradford?—Yes.

490. The route by Colne would be by the East Lancashire line, and the route by Bradford by the Lancashire and Yorkshire line?—Yes. I may add that it is not only that we are paying more for the carriage of our goods, but we are seriously inconvenienced in point of time; we find very great inconvenience especially from Manchester. From Manchester we receive goods of the value of 60,000*l.* or 70,000*l.* per annum. These goods consist of what we term cotton warps, and instead of getting them direct by the East Lancashire line by way of Colne and the Midland line to Saltaire, we have them brought by Sheffield—from Manchester to Sheffield and from Sheffield by way of Leeds to Bradford, which is more than double the distance. I should mention that the Midland Company found such obstructions placed in their way in getting hold of our goods, because they had only about 25 miles of their own line to bring them over, and the Lancashire and Yorkshire Company did not get the whole of the freight, that they were obliged to make arrangements with the Manchester, Sheffield, and Lincolnshire Company to take them by way of Sheffield. Then the Midland Company brings them to Leeds, and so on to Saltaire.

491. Can you make any comparison between the distances, showing the difference between the two routes?—I think that one is certainly more than double the distance of the other, and in point of time the inconvenience that we experience is very serious, of which I may give an instance. Only yesterday we got some cotton warps which we ought to have had

Mr. C. Stead.

29 March 1865.

on Monday morning, and a day is of very great importance to us at this season of the year.

492. (*Mr. Horsfall.*) How long does it take to get goods from Manchester by the shorter route?—We used to get them, before the amalgamation took place, the next morning, now it takes frequently two days; sometimes we get them the next day, but that does not occur often. Before the arrangement was made, to which I have just referred, with the Manchester, Sheffield, and Lincolnshire Company, they took frequently four days from Manchester.

493. (*Chairman.*) You say that by the shorter route, which is the natural one for your goods to come by from Manchester, the part of the line in the possession of the Midland Company is only 25 miles?—Yes.

494. The Midland Company would get their proportion of the charge for the distance they carried?—Yes.

495. How much of the other route by Sheffield is in their hands?—The Midland Company has about 46 miles; 36 miles from Leeds to Sheffield, and 10 miles from Leeds to Saltaire.

496. Is that the natural field of the Lancashire and Yorkshire Company?—Entirely, I think.

497. Might it not be the interest of the Midland Company to get a larger profit by carrying your goods the longer distance?—I do not think that. The arrangement was made in consequence of the complaint that we made to the Midland Company of the very serious delay that occurred in the delivery of our goods.

498. You say that by the shorter route they would only carry your goods over a distance of 25 miles?—Yes.

499. And by the longer route a distance of 46 miles?—Yes.

500. Would they not therefore receive a larger proportion of the total freight?—The fact is that we do not pay more for the goods when carried over the longer route than we do when they are carried over the shorter route. The Midland Company has to carry them 46 miles for the same rate as for 25 miles, or rather, I should say, for the same amount.

501. (*Mr. Roebuck.*) You suppose that 25 bear the same relation to the whole distance that 46 bear to the whole distance?—Yes, I think so. I do not know the distance between Sheffield and Manchester.

501. (*Mr. Dalglish.*) Are your goods taken to Sheffield?—Yes.

502. Instead of going by the loop line from Penistone, that joins at Penistone?—They go from Penistone to Sheffield, and over the Midland to Leeds.

504. (*Capt. Galton.*) And from Leeds to Saltaire?—Yes.

505. (*Sir R. Hill.*) You say that the charge for the longer route is the same as for the shorter route?—Yes, the total charge is.

506. Can you suggest what the motive on the part of the company is for selecting the longer route?—The motive of the Lancashire and Yorkshire Company and of the East Lancashire Company, which are amalgamated companies, was this;—they wanted us to send all our goods over their line to Bradford, and then, either by the Midland, a distance of $2\frac{1}{2}$ miles, and so to our works, or that we should cart them from Bradford, so that they would get all the freight.

507. (*Chairman.*) Do you believe that the Midland Company are better friends with the Manchester, Sheffield, and Lincolnshire Company than they are with the Lancashire and Yorkshire Company?—I do not know that they are. I believe that the arrangement was made almost entirely in consequence of the complaints that we made of the delay which took place.

508. The practical result of your agreement is that the Lancashire and Yorkshire Company lose the whole of your traffic from Manchester?—Yes, the whole of it.

509. Do you know what it amounts to in value?—It is certainly not less than 70,000*l.* a year.

510. Did your firm object very much to the amalgamation of those two companies?—Yes, we did, and I came up to London and gave evidence before the Committee in the House of Lords, which Committee threw out the bill.

511. That was in 1858, was it not?—Yes.

512. In the year 1859 you were not equally fortunate?—No; the Lancashire and Yorkshire Company and the East Lancashire Company made some arrangement with the Midland Company, and the Midland Company withdrew their opposition, and then the opposition of the Chamber of Commerce of Bradford failed to upset the amalgamation scheme.

513. The Chamber of Commerce of Bradford opposed on public grounds?—Yes.

514. You opposed as private individuals?—I came as a private trader and as a member of the Council of the Chamber of Commerce.

515. Will you describe shortly to the Commission the difference of the position in which you now stand with regard to your traffic at Saltaire, and the position in which you would have been if this amalgamation had not been accorded by Parliament?—The difference is this, that we should have been able to get our goods from Manchester by the next morning, whereas we have now to wait for sometimes more than two days before we receive them.

516. But I mean with regard to the charges?—As to the charges, I am not aware that there would be any serious difference, for, as I have already stated, we do not pay more from Manchester now than we did when they were brought by Colne.

517. You have not, I think, yet mentioned the rates to Manchester?—I think they are 20*s.* a ton, but they are generally for light goods. I think it is 20*s.*, but the fact is, that we do not ourselves pay the carriage: the parties from whom we purchase the goods have to deliver them and to pay the carriage themselves; therefore I cannot state with any accuracy what it is.

518. The contracts are made between you and those from whom you receive the goods to deliver them at Saltaire?—Yes, at a certain price.

519. (*Mr. Roebuck.*) Do you say that the difference in point of time is to you a matter of great importance?—Yes, it is so sometimes, not always, but it is of immense importance to us sometimes.

520. (*Capt. Galton.*) Your complaint is solely as to the delay; you have no other complaint to make?—The principal complaint that we have to make is of the delay. The charges are about the same as they would otherwise be if we had the goods brought by the Colne route. As I stated before, we do not pay the carriage ourselves, but I believe the parties who send the goods to us pay the same rate by Sheffield as they originally paid by Colne.

521. (*Mr. Roebuck.*) Although the freight is paid by those who send the goods, I suppose that that enters into the cost of the goods to you?—No doubt of that; they would charge a higher price in consequence of paying the freight.

522. (*Capt. Galton.*) What addition to the value of the goods does the carriage you have to pay make for the raw material?—That depends upon the material; in cotton warps it would not make a serious difference.

523. What is the value of cotton warps?—From 2*s.* to 10*s.* a pound.

524. (*Sir R. Hill.*) What is the cost per ton?—I cannot state exactly, but it is much more per ton upon wool, oil, and soap, and such articles as those, the raw materials.

525. (*Capt. Galton.*) Do they charge you the same price per ton for carrying all those articles?—Yes, from Liverpool.

526. (*Sir R. Hill.*) Did you say 18*s.* a ton?—Yes, we have them delivered at Saltaire at that price; but I should mention that we have been at the expense of making a siding.

527. (*Capt. Galton.*) Before the canal company was amalgamated with the railway companies did you

pay 17*s.* 6*d.* a ton ?—Yes, we are three miles nearer now.

528. Formerly you paid 17*s.* 6*d.* a ton, and you had to cart the goods because you were three miles from the place ?—Yes, we should have to pay at the present time if the company carted the goods to our works 20*s.* a ton ; but having made a siding to our works we made a bargain, and we got them delivered for 2*s.* a ton less.

529. Formerly did they carry them for 17*s.* a ton and cart them as well ?—Yes, and now for 20*s.* they do the same thing, they have delivered them at our works.

530. (*Mr. Horsfall.*) When the competition was at its height between the two companies you got them carried for as low as 8*s.* 4*d.* a ton ?—Yes, not by the railway, by the canal ; and if we had now any fair competition between the canal and the railway companies, we should get them carried at from 12*s.* to 13*s.* heavy goods.

531. (*Sir R. Hill.*) You never did get them carried, did you, for that price by the railway ?—Not to Saltaire, because our works were not completed before the arrangements were entered into between the canal and the railway companies.

532. You spoke of a large reduction in the charge by the canal company, can you give us the date of that reduction, and perhaps you can state whether it was before or after the construction of the railway, that which competed with the canal ?—It was after the construction of the railway.

533. Then it was probably caused by the construction of the railway ?—It was caused by the construction of the railway.

534. Your complaint, as I understood you, is this, that the advantage which was given to you by the construction of the railway was only a temporary advantage ; that after a while the railway and the canal companies united their interests, and then the advantage ceased ?—Yes, just so.

535. Has not that always been the case when competition has arisen between railway and railway, and between a canal and a railway ?—It is too frequently the case, but what we think is, that Parliament ought to prevent such things happening.

536. But you must bear in mind that the advantage did not commence, as I understand you, until the railway was made ?—Certainly not.

537. Therefore the making of the railway gave you some temporary advantage, and your complaint is that it was not a permanent one ?—Yes ; we complain that a competing mode of carriage has been allowed by Parliament, of which we ought to have the advantage, but now the advantage is nil.

538. (*Mr. Dalglish.*) You complain of the system of amalgamation ?—Yes ; we complain of the companies having the power to lease the canals, and having the power of amalgamating what had been originally competing lines, and which had been granted as competing lines.

539. (*Lord Stanley.*) Supposing that Parliament placed a check upon amalgamations, or at all events upon the extent to which they have been hitherto carried on, how could you prevent understandings and agreements between separate companies, which would come practically to the same thing as amalgamations?—That is a question, I think, for Parliament to consider. I do not see how it could be done as to understandings and agreements. If there were no leases allowed to be granted, such as the lease of the Leeds and Liverpool canal to the four railway companies which I have already mentioned, private traders would have been on the canal, and we should always have had sufficient competition.

540. (*Mr. Dalglish.*) Do you know what dividend the canal company paid before the amalgamation took place ?—The canal shares were once very high ; a 100*l.* share was as high as 800*l.*

541. Then it paid a very good dividend ?—Yes.

542. Do you know what the rate of toll was ; was it $\frac{3}{4}d.$ or $1\frac{1}{2}d.$?—It was about $\frac{3}{4}d.$, I think.

543. If no amalgamation had taken place between the canal and the railway companies you would have been able to get your goods carried for $\frac{3}{4}d.$ still ?—Certainly.

544. And your goods would be carried at 12*s.* a ton ?—Yes, from 12*s.* to 14*s.*

545. (*Sir R. Hill.*) No amalgamation has taken place between the trustees of the Duke of Bridgewater's canal and the Manchester and Liverpool Railway Company ?—No ; but I believe that there is an amalgamation or a leasing or some agreement between the Manchester and Rochdale Canal Company and the Lancashire and Yorkshire Railway Company ; for instance, when some of our private carriers were thrown off the Leeds and Liverpool canal, who were carrying goods from Liverpool to Bradford or Leeds, they made an arrangement to bring them over the Duke of Bridgewater's canal, and then over the Manchester and Rochdale canal, and then on by the Calder and Hebble canal to Wakefield, and then on the Aire and Calder canal to Leeds, and so to Bradford.

546. It was stated in evidence the other day that an agreement had been entered into between the railways serving Liverpool and the trustees of the Duke of Bridgewater's canal, which had the effect of fixing rates upon the canal and the railways at the same amount ?—Yes.

547. That was not the result of amalgamation ?—No.

548. Supposing that Parliament had not assented to the amalgamation which has taken place, and of which you complain in your neighbourhood, might not the canal and the railway companies have come to an understanding precisely the same in effect ?—No, not precisely ; it would have been much more difficult to do so. We had then the Lancashire and Yorkshire Company, and the East Lancashire Company.

549. Might they not have come to such understanding ?—Of course it is possible that all the railways in the country might come to some such understanding and charge us even the maximum rates.

550. (*Mr. Hamilton.*) Your complaint is that Parliament granted exceptional facilities, which deprived the public of those competing lines by authorizing amalgamation ?—Yes, that is undoubtedly so, by allowing those various railway companies to lease the canal.

551. (*Chairman.*) You were about to state something with reference to the Manchester and Rochdale canal ?—Yes ; I believe that some agreement has been made with the Rochdale canal. When our private carriers were swept off the Leeds and Liverpool canal they arranged to bring goods from Liverpool to Leeds by way of the Rochdale canal, the Duke of Bridgwater's canal, the Calder and Hebble and the Aire and Calder canals ; that was the arrangement they made with the four companies. That was in force until the 15th April 1856, on which day the letter which I hold in my hand was sent to our private carriers in Bradford, Messrs. Crowther and Dickson. It is in these terms :—"Gen-
" tlemen, I beg to inform you that on the first day of
" May next the present dues charged on this canal
" will be advanced on that particular class of traffic,
" which you have lately been carrying from Liver-
" pool to Leeds. The dues will not be less than
" 2*d.* per ton per mile, and in all probability some-
" thing more." Twopence per ton per mile would amount to nearly 1*l.* a ton, and perhaps over that, for dues alone.

552. From whom did that letter come ?—It came from the Rochdale canal office.

553. (*Mr. Horsfall.*) £1 per ton for what distance ?—From Liverpool to Leeds, which is a distance of about 120 miles, but this is not by the direct Leeds and Liverpool canal.

554. (*Sir R. Hill.*). Has the company any legal right to advance their rate to 2*d.* per ton per mile ?—

Mr. C. Stead.
29 March 1865.

Yes; they have a legal right to advance it to their maximum toll, but not beyond that, whether their maximum toll be 2*d.* or 3*d.* I am not in a position to state. These parties made an arrangement with those four canal companies which enabled them to bring goods to Leeds and Bradford, and thereby compete with the railways. Then upon the Lancashire and Yorkshire Company making some arrangement, as these private carriers told me, with the Rochdale Canal Company, the Rochdale Canal Company sent them this note, by which they advanced the tolls to 2*d.*

555. That was not the result of amalgamation?—It was the result of the Lancashire and Yorkshire Company leasing the tolls of the Rochdale canal; it was the result of some arrangement of that kind, the parties could not tell me the particulars; it is very difficult to get at these things.

556. (*Mr. Dalglish.*) You judged that it was so from the difference between 8*s.* 4*d.* and 18*s.*?—No doubt.

557. (*Chairman.*) Would it be, in your opinion, any protection to the public if the railway companies and the canal companies were obliged, when they entered into arrangements of this sort, to make them public?—Undoubtedly, and that is, I think, one of the things that Parliament ought to look to.

558. (*Sir R. Hill.*) Can you see any means of obtaining evidence of such arrangements being made?—I see it in this case.

559. You see certain results, from which you infer that there has been some arrangement made, but you have no positive evidence of it?—No, no other evidence than this letter.

560. (*Mr. Roebuck.*) I suppose a law might be made to put a manager upon his oath?—I suppose so.

561. (*Mr. Hamilton*) You say that the effect of the arrangement, whatever that may be, has been to increase the dues to 20*s.*?—Yes. I infer from this communication that they would be at least 20*s.*

562. What would the whole freight amount to?—Nearly 30*s.*, this is what any private carrier has to pay to the canal company for going over the canal. When we were paying 17*s.* 6*d.* from Liverpool, the dues were about 7*s.* 1½*d.*

563. (*Capt. Galton.*) Is there any cause to which you can attribute the delay of which you complain, or do you know why it arises?—We believe that it arises in this way; from Manchester to Saltaire was over only a part of the Lancashire and Yorkshire railway and the East Lancashire railway, which were amalgamated, and they wished to get all the freight.

564. How would that cause delay?—If we did not send the goods by way of Bradford they did not care whether they brought them or not. The same parties complained to us in this way, that the East Lancashire Company's carters refused to take the goods that were sent to go on a certain day; they refused to take them, because they were ordered to go by the East Lancashire railway.

565. By way of Colne?—Yes.

566. As I understand you, the goods must pass over the Midland line to get to the Lancashire and Yorkshire railway?—Yes, but I am referring to goods going from Manchester; if they came by Colne from Manchester the Lancashire and Yorkshire Company would only receive that portion of the freight to Colne.

567. Why does it matter to you which route the goods come by?—If we get them by the Lancashire and Yorkshire line to Bradford, which is the only other direct route that we have, we should have to cart them, either from Bradford to Saltaire, a distance of 3 miles or 3½ miles, or send them over 2½ miles of the Midland line.

568. You would then have to pay a higher toll?—We should have to pay the same toll to Bradford as we now pay to Saltaire.

569. The companies do not afford you facilities for sending them?—No; they charge the same to Bradford as we now pay the Midland Company to Saltaire. We should have the same amount to pay if we got our goods by way of Bradford.

570. Then your complaint is, that you cannot book the goods by the shortest route from Manchester to Saltaire?—Yes; by the direct route, we cannot book them without such practical difficulties being thrown in the way, that it is in point of fact as though we had no line.

571. (*Mr. Dalglish.*) Can you give the distance by the Sheffield route as compared with the other?—No, I cannot give it precisely.

572. I mean within 20 or 30 miles?—I suppose the distance from Sheffield to Manchester is not far from 50 miles.

573. The distance, I suppose, is about double?—I think it is quite double.

574. The competition existing between these railway companies induces you to send your goods over double the amount of distance at the same rate?—Yes.

575. That is the ground of your complaint?—Yes.

576. The difference in charge is only 2*s.* for the cartage between Bradford and Saltaire, but it is a great advantage to you to have your goods sent in the night, instead of occupying three or four days?—Yes.

577. Would it not be better in cases of difficulty to have them sent to Bradford, and then to be carted at the expense of 2*s.*?—We do that occasionally, just according to the nature of the pressure that is put upon us.

578. It is the competition which exists between the lines that produces this difference in the charge, one line having a siding to your works, while the other line takes your goods only to Bradford?—Yes.

579. (*Mr. Horsfall.*) If it pays the railway company to charge 20*s.* by the longer route, which is double the distance of the shorter one, ought you not to get your goods by the shorter route at half the amount?—Yes, of course we ought; but it sometimes happens that railway companies will convey goods just for the sake of the traffic over very long distances at the same rate.

580. (*Sir R. Hill.*) But of course they suit their own convenience in doing that?—Yes, it is done to suit their own convenience. We are very good customers of the Midland Company, and I am sure that they would do all they could to oblige us in any arrangement that they could make. It is in consequence of the repeated complaints that we have made of delay in the carriage of our goods from Manchester that they have made this arrangement with the Manchester, Sheffield and Lincolnshire Company, and they made also an arrangement with the Lancashire and Yorkshire Company to carry them over the East Lancashire route, but the East Lancashire Company threw such difficulties in their way by ordering their carts not to take the goods when they were to be taken over the East Lancashire route that we could not get them.

581. (*Mr. Horsfall.*) By which route do you get your goods from Liverpool?—By the East Lancashire and the Midland; they did not put the same difficulties in the way there.

582. (*Capt. Galton.*) That is to say, by Colne?—Yes.

583. If the Midland Railway Company are disposed to afford you such facilities, why will they not transport your goods over the 2½ miles?—Because they would not only have to convey them over the 2½ miles, but they would also have to cart them across the town of Bradford, the stations do not join, one is on a high level, and the other is on a low level, and that is the difficulty; by Bradford we have no direct railway communication, the goods have to be carried across the town; we sent them by that route, but we found even greater difficulties.

584. (*Chairman.*) Are there any other facts that you wish to state to the Commission?—I do not know that there are any.

585. (*Sir R. Hill.*) Have you any remedies to suggest?—I do not know that I have; the only thing is this, that when the lease, if the railway companies have a lease of the canal, falls out, Parliament, if it has the power (and if it has not I think it should have it), ought to prevent such things being entered into.

586. (*Capt. Galton.*) You do not seem to have much to complain of as to the rates, or because they are charging you more, or much more now than they were charging you before?—No.

587. Therefore, all you desire to have is competition, so that the rates might be reduced to 8*s.* 4*d*?—We do not expect 8*s.* 4*d.*, but from 12*s.* to 14*s.*; we ought to pay 12*s.* instead of 18*s.*

588. You complain that there is not unlimited competition?—I complain that there is no competition.

589. (*Sir R. Hill.*) The rates which you now pay are lower, are they not, than the rates which you paid before the railway was constructed?—I dare say they are.

590. Then you have benefited by the construction of the railway?—Undoubtedly so, but we have not benefited to the extent that we think we ought to have benefited, and not to the extent that we should have benefited, if there had been no lease of the canal. The canal company paid a good dividend, they were common water carriers, and were making a good profit out of their business.

591. (*Mr. Hamilton.*) Do you pay more at the present rate than is generally charged in that part of the country for equal distances?—It is very difficult to say that, for really I do not know; but looking at the comparative charges, we pay 10*s.* a ton more from London to Saltaire, or to Bradford, than from London to Liverpool, which is about the same distance; in our case we pay 35*s.* a ton, whereas to Liverpool it is 25*s.* per ton.

592. (*Chairman.*) That you think arises from want of competition?—Yes.

593. As far as your London traffic is concerned, you are completely in the hands of the Midland Company?—Yes; we are in their hands almost entirely, if they chose to make an arrangement with the Great Northern Company not to carry goods under a certain price.

594. I suppose you know that between London and Liverpool there are two or three railway companies?—Yes, there are three competing lines. What we desire to see is, the Great Eastern Company go to Askerne, and so on to Bradford.

595. Your grievance would apparently be met if the Midland Company were amalgamated with the Lancashire and Yorkshire Company, for it would not be then contrary to the interests of the Lancashire and Yorkshire Company to carry your goods to Bradford instead of taking them round by Colne?—Certainly.

596. (*Mr. Dalglish.*) If a railway is to be looked upon as a common road, a certain toll to be charged per mile, do you think that the carriers of goods would take them round by Sheffield to your works at Saltaire instead of round by Colne?—No, certainly not.

597. Under those circumstances you would know exactly what you had to pay, and you would get them by the cheapest route?—Yes, certainly. I have already stated that for our goods carried from London we pay 35*s.* per ton to Saltaire, whereas, if we had them sent to Liverpool, which is just about the same distance, or within two or three miles, they would cost 25*s.* a ton. Saltaire is about the same distance from London as it is from London to Liverpool.

598. (*Sir R. Hill.*) And the charge from London to Saltaire is the heaviest?—Yes, it is 35*s.*, and from London to Liverpool 25*s.*

599. (*Capt. Galton.*) Because there is no competition to Saltaire?—Practically, we have no competition; the Midland Company and the Great Northern Company arrange that the toll shall be 35*s.* a ton; but there is a little more competition in manufactured goods; they convey them for 30*s.* per ton from Bradford to London.

600. (*Chairman.*) Do you mean to say that the raw material carried from Bradford to London is charged 35*s.*, and that the manufactured goods carried from London to Bradford are only charged 30*s.*?—Yes.

601. (*Capt. Galton.*) What is the reason of that?—I cannot state it precisely.

602. (*Sir R. Hill.*) Is it not because the unmanufactured article is greater in bulk, and requires more space?—I do not think that is the reason.

603. But it does in point of fact require more space?—It requires a little more.

604. Does it come pressed into bales?—Yes, very often.

605. (*Capt. Galton.*) What is the cost per ton per mile?—I cannot say.

606. (*Sir R. Hill.*) There would be a vast difference, I presume, in the value of the manufactured and the unmanufactured article?—Yes.

607. (*Mr. Horsfall.*) Which are the competing lines between you and Liverpool?—We have no competing lines, they are all now amalgamated; the Lancashire and Yorkshire and the East Lancashire lines were two competing lines, but since their amalgamation we have no competing lines.

608. Have the rates been raised?—The rates, I think, have not been raised since then to Liverpool.

609. (*Mr. Gower.*) Is the arrangement which they have made to subsist for a certain time only, or is it unlimited?—It is unlimited as to a day, but it may be altered at any time. If the amalgamated companies were to say to the Midland Company, we will have on our traffic to Saltaire a local rate, say to Colne, the Midland Company would have to put us at a higher rate again on the whole.

610. (*Capt. Galton.*) How much below the maximum rate do they now charge you?—That I cannot say. On our traffic from Liverpool we complain that the canal is virtually closed to us.

611. (*Chairman.*) As a matter of fact, you bring nothing by the canal from Liverpool?—Nothing at all.

612. (*Mr. Hamilton.*) Are there no trading boats upon the canal?—No; the private carriers were driven off by the amalgamation which took place between the railway companies and the canal company.

613. (*Sir R. Hill.*) What boats are there on the canal?—They are merely boats to carry limestone and such things.

614. If you chose to put boats on the canal I presume you could do so?—They would charge us $1\frac{1}{2}d.$ per ton per mile, which would amount in dues alone to what the railway company charges for the carriage of the goods. The amalgamation drove off the private traders.

615. Is it not the case that you do not use the canal because the railways afford you greater facilities and they charge for the carriage of your goods at a lower rate?—Yes; they charge us a lower rate, but if the canal was open, and was simply in the hands of the Leeds and Liverpool Canal Company, and we were private traders on it, instead of 18*s.* a ton, we should get goods carried for 12*s.* or 13*s.* a ton.

616. You think so?—We have no doubt of it.

617. I think you attach more imporance to the injury which you suffer from the delay which takes place than from the slight increase in the cost of carriage?—That applies principally to the Manchester and Saltaire traffic.

618. Not generally?—Not to the Liverpool traffic.

619. (*Capt. Galton.*) Nor to the London traffic?—No.

620. Your principal traffic is from Manchester to Saltaire?—Yes, in certain classes of goods; in

Mr. C. Stead. 29 March 1865.

manufactured goods the principal traffic is from Manchester, and in raw materials from Liverpool.

621. Do you send any goods that you manufacture chiefly to London ?—We send them all to Bradford. We dispose of our goods in Bradford in an unfinished state; we do not finish our goods, but we sell them in what we call the grease.

622. Are they then finished in Bradford, and are they then sent in bales by the Bradford merchants away to London, or Hull, or Liverpool ?—Yes.

The witness withdrew.

Adjourned to Wednesday next at 12 o'clock.

Wednesday, 5th April 1865.

PRESENT:

THE RIGHT HON. THE EARL OF DONOUGHMORE.
THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
THE HON. E. F. LEVESON GOWER, M.P.
THE RIGHT HON. ROBERT LOWE, M.P.
SIR ROWLAND HILL, K.C.B., F.R.S.
J. A. ROEBUCK, ESQ., M.P.
T. B. HORSFALL, ESQ., M.P.
ROBERT DALGLISH, ESQ., M.P.
A. S. AYRTON, ESQ., M.P.
CAPTAIN DOUGLAS GALTON, R.E., F.R.S.
J. R. M'CLEAN, ESQ.
W. POLE, ESQ., F.R.S., *Secretary.*

THE RIGHT HON. THE EARL OF DONOUGHMORE IN THE CHAIR.

Mr. J. S. Wright. 5 April 1865.

Mr. JOHN S. WRIGHT examined.

623. (*Chairman.*) You are a manufacturer and merchant at Birmingham ?—I am.

624. And vice-president of the Chamber of Commerce ?—Yes.

625. And acting chairman of the Council ?—Yes.

626. Are you familiar with the charges made for goods by the various railway companies running into Birmingham ?—I am familiar with them, both from my own experience in several cases in some trades, and from information obtained as to others.

627. Will you state to the Commission any objections which you have to make to the present system of charges ?—We consider that the charges from Birmingham are generally very high compared with the various other districts of the country; they are also very unequal; to some places we have rates double or treble to what we have to other places.

628. Do you mean for an equal distance ?—Double or treble per mile. It is a matter of very great importance to Birmingham, being an inland town, so far away from the sea ports, many of our articles being exceedingly fine as regards profit—heavy articles—in which we suffer great competition from the Belgians and others. There are two specialities; for instance, in the Birmingham trade there is iron wire, and we suffer great competition with the Liège manufacturers always; and also in nails, although we are very closely running together; and also in brass wire with the French manufacturers. We have very great competition also from some of the sea ports with other manufacturers near to the sea ports, which makes it important to us to have the lowest possible rates of carriage; but we find unfortunately that the rates to our principal ports are very high; for instance, on hardwares, our rate to London is 27*s.* 6*d.* per ton; to Sheffield, which is a less distance, it is 40*s.* per ton; to Liverpool, where there is no delivery and no cartage, it is 20*s.* per ton, or it may be from 21*s.* or 23*s.* with delivery; to Southampton it is 30*s.* per ton, which is about the same distance as to Hull, to which place it is only 22*s.* 6*d.* However, Liverpool and London are the only principal ports, but that is for the export of our goods. If we compare these rates with the rates to Bristol, we shall find that to Bristol we have a very low rate, and we should have no reason to complain if our rates were tariffed the same as to Bristol; for instance, for the same class of goods we pay 15*s.* 5*d.* per ton against from 21*s.* to 23*s.* to Liverpool, or 40*s.* to Sheffield. To Newcastle, which is more than twice the distance it is to Sheffield, the second-class rate is only 35*s.*; it is less than to Sheffield. In the provision trade there are some very curious anomalies; molasses, for instance, an article that is used in Birmingham both for manufactures and for food, is brought at 12*s.* 1*d.* from Bristol, but from Liverpool it is 16*s.* 8*d.* Molasses and sugar are both in the same category. From London the rate is 21*s.* 8*d.* Currants are higher than sugar from Liverpool; being less in value they are higher in freight. Provisions are a very important trade in Birmingham. Bacon is a type of the provision trade. The rate from Liverpool to Birmingham is 20*s.*; from Birmingham to London, it is 27*s.* 6*d.*; from Liverpool to London it is taken direct at 25*s.*, less than half. The same article is charged from Birmingham to Shrewsbury, a distance of 42 miles, 20*s.* also, that is about one-fifth of the distance; from Liverpool to London it is only 20 per cent. less cost. From Birmingham to Rugby there is a still greater difference; the rate is 17*s.* 6*d.* a ton, and to Coventry 14*s.* 2*d.* To Hartlepool there appears to be, from some cause or another (going over, we believe, two lines of railway), a moderate rate, namely, 22*s.* 6*d.* for 185 miles, being 5*s.* less than the rate to London, which is only 112 miles.

629. Upon what article is that last charge made ?—Upon provisions, such as bacon, I expect, and cheese, and things of that size; bacon may be taken as the type. From Liverpool to Birmingham we are charged 20*s.*; from Birmingham to Gloucester, 15*s.*; (sometimes there are delays in Birmingham, which makes a difference) 35*s.* a ton; from Liverpool to Gloucester it is carried at 20*s.* per ton. As regards the article of wire, which is a very important article in our manufactures, and is coming very much more extensively into use for telegraphs and for fencing, and is used in all parts of the world; I have frequent dealings in it, and the rate is 21*s.* 8*d.* to London. I have recently had an importation from Liège, which has to come to London for export to China or Japan; the whole freight from Antwerp to London, being partly by water *viâ* Harwich, is 10*s.* per ton.

630. (*Mr. Horsfall.*) That is from Antwerp to London ?—Yes; *viâ* Harwich. I believe the steamers belong to the Great Eastern Company. With regard to manufactures in iron, the rate from Birmingham to London is 20*s.* 8*d.*, and it is only the same to Brighton. To Swansea the rate is 10*s.* I think the distance is 155 miles; but to a place called Briton Ferry, which is 12 miles nearer to Birmingham, the rate is 11*s.* 8*d.*; 1*s.* 8*d.* more, although 12 miles nearer to Birmingham. In the same trade the railway companies will take to Hartlepool, which is 185 miles, manufactured iron, in two-ton lots, at 20*s.* per ton; but if it is only in lots of one ton the charge is 30*s.* To Workington the charge is, for two tons, the same, 20*s.* a ton; but if it is only in one-ton lots the charge is 37*s.* 6*d.* I have observed that metals were a very important trade in the shape of wires and tubes. I believe that we make in Birmingham the principal parts of the tubes used in locomotives, not only in this country but abroad, and we find that the rates are exceedingly various for metal goods. As to brass, we pay to Bristol, 12*s.* 1*d.*, to London, 21*s.* 8*d.*, to Glasgow, 30*s.*, that being nearly

three times the distance that it is to London. Spelter we have brought from Hull at 12*s.* 6*d.* per ton; from Hartlepool, which is 58 miles farther, it is 14*s.* 2*d.*; but from London we are charged for it, a distance of 112 miles, 18*s.* In manufactured metals we are charged from Birmingham to Wolverhampton, 14 miles, 8*s.* 4*d.* per ton. To Gloucester, 54 miles, four times the distance, 7*s.* 6*d.* The distance there is somewhat more than four times what it is to Wolverhampton. To Swansea, which is 155 miles, the rate is 18*s.* 2*d.*, against 8*s.* 4*d.* for 14 miles. To Plymouth, a distance of 220 miles, the rate is 25*s.* 9*d.* The Commissioners are, no doubt, aware that glass is a very important article, and the great works that are in the neighbourhood of Birmingham are deservedly celebrated all over the world. They have to pay, I believe, about as much for the conveyance of their glass to London as manufacturers in Sunderland or St. Helen's do, and the difference is very small, if any, in this particular trade, including all the articles that are used by plumbers. Glass, which was formerly worth 11*l.* per crate, is now worth only 2*l.*, since the improvements which have taken place in manufactures, and since the abolition of the duty; but the rate for carriage is the same as it was formerly, and higher than it was previously, when carried by canal. Formerly, manufacturers inform me that they had glass and glass wares for the plumbers' trade carried at about 10*s.* per ton, within 50 miles of Birmingham. At the present time, the rate to cover risk of breakage, which we can very rarely get allowed, is three times that amount. The article is heavy, and a sheet of glass probably of the thickness of one inch, for walking over and other purposes, is packed in very strong cases, and the railway companies insist upon its being put in the third class. The rates are very high, in order to allow for breakages, but they are not allowed for when they take place. The companies always resist any claim that is made for breakages. In this particular trade it is found that the rates vary, and for some time back, for instance, going into Tenbury from Birmingham, they would be charged 17*s.* 6*d.* per ton; but if they are brought back from Tenbury, they will be brought back at the rate of 12*s.* 6*d.* per ton. I think I have probably given the Commissioners sufficient instances of the inequalities of the rates from Birmingham. I have a very much longer list, and the Commissioners will probably permit me to send them, before their proceedings are closed, a complete tabulated statement of them.

631. (*Chairman.*) Are the rates which you have now given the existing rates?—Yes.

632. Can you give the Commissioners any information as to any changing of the rates? Are the railway companies whose lines run into Birmingham in the habit of making sudden changes in the rates?—Occasionally they make changes, and generally, as far as my experience has gone, against the traders, and in their own favour. I will give the Commissioners two or three instances. Blacking is a cheap article; say, for instance, that it costs about 15*l.* a ton. It was originally put into the lowest category. It has now been raised to the second; and so with an article that is largely imported for various manufacturing purposes, again, vegetable ivory. It was formerly in a low category, and that has been raised to the second category. The article of buttons was recently raised from the second to the third class. It is, however, right to say that upon a memorial being sent to the principal railway companies from the Chamber of Commerce, the railway companies reduced the rate, or they put the article back again into the second category. Sometimes the railway companies, at their discretion, for we feel that we are entirely in their hands, make whatever laws they think proper for us, and they will divide part of the goods sent; they will divide the lots of goods sent, for example, a party in Birmingham will send two or three sorts of goods, I will suppose, to London; they will divide them; suppose that one parcel will weigh 26 lbs., another parcel 60 lbs., and another parcel 30 lbs.; the railway companies will divide those, and call them "smalls," and for them they have a fixed rate, thereby doubling the amount of carriage which would be charged if they were packed in a box and sent under the highest class, that is, for the best article.

633. (*Capt. Galton.*) That is to say, the railway companies do not allow two or three different persons to combine to send their goods in one box?—No, they do not allow one manufacturer sending three different articles, tubes, brass wire, and iron wire to one party, so to send them, but they will be divided; the whole would be charged per cwt. 2*s.* 6*d.*, but it will be divided into two or three parcels, and the railway company will charge separately for those parcels, thereby doubling the rate of carriage on that particular cwt. of goods.

634. (*Mr. Horsfall.*) That is to say they would not charge the same rate if you paid the carriage. Does not the difference arise from the goods being distributed to three different parties?—No. If they charged the highest rate of carriage for the most valuable article, it would not come to more than one half the amount that they charge when charged as "smalls."

635. Supposing that you paid the carriage on those goods which, as I understood you, the manufacturer sent to two or three parties?—No, I said to one party, they are intended all to go to the same party.

636. (*Sir R. Hill.*) Do you mean when goods are put into the same package?—No, they are tied up in bundles; iron wire is tied up in bundles, and tubing is tied round.

637. (*Mr. Roebuck.*) Would they allow you to put them all into one package, or would they open it?—They would not open it, they would be allowed to be put into one package, but the package would be considered equivalent to extra carriage; but these articles are never put into packages.

638. (*Mr. Ayrton.*) Are they not goods of the same sort coming within the provisions of the Railway Act?—The iron wire or brass wire or brass tubing are put into different classes.

639. The Act of Parliament is only made applicable to packages in the same classes, which are to be charged together. Are you not aware that there is such a tariff?—Provided they belong to the same class of goods. Supposing that I packed iron wire in casks and brass tubes in casks, they would not be carried at the same rate, but, as I have said, they would be divided.

640. Then they would not be goods I presume, of the same class within the meaning of the Act of Parliament, or subject to the rates sanctioned by the Act of Parliament?—No, but if they were put together the manufacturer would have no objection to their being charged at the highest rate. What he objects to is that one cwt. of goods, composed of two or three different materials, should be divided, and made special packages of.

641. What I want to know is, whether the railway companies do more than what is directed by the Act of Parliament under which they are working, and which does not require them to charge for several packages, unless they are packages of the same commodity?—There is no Act of Parliament I believe which necessitates what they do; they can charge the highest price, and there is no reason why they should unfairly divide them, if they can charge the goods in the highest class.

642. (*Capt. Galton.*) I think that what you mean is that any articles in the same class ought to be taken as one consignment?—One consignment; they might be taken from the lower class, and they might be charged in the higher class, but what we say is, that they should be charged as one lot of goods.

643. (*Mr. Ayrton.*) Do you consider that the railway companies act contrary to the tariff which is prescribed for them in their Acts of Parliament, or do they act in accordance with it?—It is not for us to say whether they, technically or legally, would be per-

Mr. J. S. Wright.

5 April 1865.

mitted to do this, but we consider that it is a hardship upon us to have a consignment divided into two or three lots and charged as smalls. This particular case goes over the lines of two companies, and one of the companies says that the claim of the manufacturers is just, and the other company says that it is not; the consequence being that the manufacturer has to pay a double cost.

644. Your complaint is, not that the railway companies do anything wrong as to the law, but that, doing what is right, you do not like it?—I do not mean to charge them with acting illegally. Most of these powers were granted many years ago, and under different circumstances; and I am endeavouring to show that the powers which they possess bear very hardly upon the trade in Birmingham, and amount almost to a prohibition to our inland trade.

645. (*Chairman.*) Have any of these railway companies in Birmingham made themselves owners or lessees of any of the canals?—There are several canals that are now owned in our neighbourhood by railway companies, and with others they have made arrangements by which, practically, we have to pay the same rates by the canals as we do by the railways. For instance, the Shropshire Union canal belongs to the London and North-western Company. They bring goods from Liverpool to Birmingham. The Grand Trunk canal belongs to the North Staffordshire Company. The Old Birmingham canal belongs also to the London and North-western Company, only they give a guarantee for a dividend of so much per cent., taking the control of it and regulating the rates of carriage. The Worcester and Birmingham canal is free from railway control, but that only comes to the confines of Birmingham; for to come into the town it would have to pass over the Old Birmingham canal, which is in the hands of the London and North-western Company, and consequently they fix such rates as prevent competition.

646. (*Capt. Galton.*) Has not the Worcester canal Company got a wharf of its own in Birmingham?—On the outside of Birmingham they have.

647. Is it not very near the centre of Birmingham?—No; there the old Birmingham canal begins, and there the company that has the control of that canal fixes the rates which prevent it from entering into competition with the railways; and practically the Worcester and Birmingham canal is of no use to Birmingham, as against the railways. The Stratford and Birmingham canal is held now by the Great Western Railway Company. There are other canals, for instance, the Bridgewater canal, the trustees of which are not under the control of any railway company; but there have been arrangements made or understandings come to by which, practically, they keep up the rates to the same amount as the railways.

648. (*Chairman.*) From the very nature of the difference between the mode of carrying the goods upon a railway and upon a canal, the time occupied is greater on the canal than on the railway?—Yes.

649. If you deliver goods to a railway company to carry a distance of 100 miles from Birmingham, and you deliver the same quantity to a canal company, you would of course get your goods delivered more quickly by the railway company than by the canal?—Certainly; and we say that we therefore ought to have lower rates by the canal, as we do not want the goods delivered so quickly.

650. But you say, that in point of fact, the rates upon the canals and upon the railways are the same?—Yes.

651. (*Mr. Roebuck.*) In fact there is no competition between the two?—None whatever.

652. And that competition is prevented by some arrangement existing between the canal companies and the railway companies?—Yes.

653. (*Chairman.*) There are several railway companies running into Birmingham, the London and North-western, the Great Western, and the Midland?—Yes.

654. Has not the competition between those three companies had some effect in lowering the charges?—Just the contrary.

655. Not even between the places to which they do compete?—It is the contrary. When the Great Western Company, in the year 1859, was promoting some Bill in Parliament under the ostensible guise of a Bill for making a bridge, and for the revision of the tolls, they proposed to take powers which would have raised enormously the rates of carriage over their line. This Bill, by the action of the iron masters, to whom it would have been of the most serious consequence, and of the Birmingham Chamber of Commerce, and of the various trades, was, I believe, ultimately abandoned; but it was stated in evidence then, as my own memory in a great measure bears out, that the effect of competitive lines has been to raise the rates of carriage, and notable instances were given that, about the year 1839, the rate of carriage from Birmingham to Liverpool was 13*s.* 4*d.* per ton for hardwares by railway. At or about the same period I had had goods in the same class brought from Liverpool by canal for 12*s.* 6*d.* a ton; but the railways fixed at that time the rate at 13*s.* 4*d.*, and I believe that, at that time, they were paying a dividend of 10 per cent. They were afterwards incorporated with the Manchester and Birmingham line, and then the rates were raised from 15*s.* to 17*s.* 6*d.* a ton, when they became thoroughly amalgamated with the London and North-western Company.

656. What class of goods are you speaking of now?—Hardware goods, second-class goods. When the Great Western Railway Company opened their line to Liverpool, on that day or in the same month that they opened, by an arrangement between the two companies, the rate was raised to 20*s.*, and so it stands 20*s.* by the London and North-western Company, and by the supposed competing line of the Great Western at 20*s.* When it was "Grand Junction," alone, it was 13*s.* 4*d.* I need not perhaps say, after that, how obvious it is that, if there are two lines of railway having to pay two dividends, which one would have done out of the same traffic from the same locality, they will naturally endeavour to make an arrangement by which they shall get the same amount of dividend with which the one would have been satisfied.

657. (*Mr. Roebuck.*) But the evil having been done, and the two railways having been made, what remedy have you for that of which you complain?—That the rates should be placed under the supervision of some independent board; that they should be regulated with some regard to uniformity; that there should not be so large a variation in the rates between places as there is permitted to be at the present moment; that an approximation to an equitable system would be that there should be a graduated mileage rate. We cannot expect to have goods taken from Birmingham to Wolverhampton, a distance of 14 miles, at the same rate per mile as from Birmingham to Aberdeen; but we nevertheless think that we should not be paying so enormously to the purse of the companies, because it frequently happens that lines may have been extravagantly made or they may have been extravagantly worked, and it is not just, in our opinion, that the trades of the country should be called upon to pay for that extravagance either in working the lines or in the outlay for the original construction.

658. That is to say, you would not allow a railway company power under their tariff to charge what price they pleased within that tariff, but you would place over them some supervising body?—Yes.

659. (*Mr. Ayrton.*) How would that supervising body be able to regulate the rates so as to ensure the same dividend to the railway company as they now receive?—It does not follow that they should ensure always the same dividend, neither ought the railway companies always to look for the same dividend. They are looking for, and the tendency now is to make the trade of the country pay, a high dividend to the railway companies under the powers which they have. It is quite possible for railway companies to be paying

a high dividend, and to be very prosperous, while the trade of the country may really be in a difficult position, and may be very much depressed.

660. (*Mr. Roebuck.*) Is not that an objection that would equally apply to yourself; for example, you might be making a large fortune, and the trade of the country might be suffering, but would you consider that a ground for interference with you by anybody?—I do not think that you can put private traders and railway companies into the same category. I am regulated entirely by competition. I dare say that I should have the same feelings under similar circumstances as railway companies, and if I could take my wares into any town in England or on the continent, and be sure that they could get them from nowhere else, I think that I should be tempted to get a very high price for them, and I consider that I should deal somewhat more cavalierly than I can do in the present state of competition with my customers now. It appears to me that Parliament has given to railway companies a monopoly of the trade of the country, and that the trade is now entirely in their hands.

661. Has Parliament given them a monopoly, or is it not that from the nature of things they have acquired a monopoly?—They only have their powers from Parliament; they would have no power but what Parliament has given them.

662. (*Mr. Ayrton.*) If an owner of land owns all the land round a town, has he not a local monopoly of the land, and do you see any difference between the monopoly of a railway company and the local monopoly of the owner of land round a town?—I think that the cases are very different, because you cannot suppose a local person to have so extensive a monopoly as to interfere with the whole trade of a town or district, but a railway company may have, and Parliament has placed not only one trade in their hands, but it has placed at their disposal the whole of the trades of the locality.

663. Your idea proceeds upon the footing that railway proprietors may not be considered to have a property in their dividend which is to be respected?—They have a property in it that is to be respected, but not unfairly at the expense of the trading community, and I think I may give you instances of this; that if a railway company, take the Midland Company, for instance, will pay at the present time a dividend of perhaps 7 per cent. or more, and will carry goods for me at a low rate, suppose 20*s.* a ton, it is not fair to give the Great Western Company, or any other company because they may have constructed their line very expensively, or may have conducted it very expensively, I say it would not be fair to give them twice or three times the amount of rate that is due to the Midland Company.

664. If Parliament permits a railway company to earn, as they best can, within certain limits, a certain interest for the money expended, is not that a simple right of property in their earnings?—Yes; but Parliament may have done so under one set of circumstances which might not be proper for another set of circumstances at a future time. It may be that circumstances have changed, that trade has developed itself, and has become more extensive than it was at a particular time; and therefore we ask for the thing to be fairly considered periodically by Parliament, in order that we may, and the trade of the country, be fairly dealt with, and not injured.

665. If you were to alter that arrangement, would it not be necessary to tender to the parties so interfered with the money that they may have expended upon the faith of that arrangement?—I am not sure that it would be in all cases equitable to do so, because one line may be very extravagantly managed, but we are not called upon to pay for that extravagant working of the line.

666. I am desirous of knowing how you propose that any authority shall regulate the rates with a due regard to the dividend, or whether you propose that that should be the duty of the authority or not?—We think that it must only be considered relatively to the trade of the country, and that it would not be right to destroy the trade of a locality, or the particular trades of a locality, for the benefit of railway companies.

667. But what is your view with regard to setting up an authority; upon what principle would you propose that it should act. Should it fix the rates and take upon itself the responsibility of making a dividend for the shareholders, or should it fix the rates and leave the shareholders to meet the risks and the consequences?—We think that Parliament should see that there are equitable rates charged all over the same line; for instance, that there should not be a variety of charges at the caprice of any railway company. A company may find it to its interest to give very low rates from one place to another, in order to drive out competition, and that may be injurious; and it may find it to its interest to give very high rates from another locality, in order to make up for the other low rates, and to get them a dividend. We claim that at least we should be placed as nearly as possible upon equitable and fair terms.

668. (*Mr. Roebuck.*) A railway is made under a certain stipulation between the railway makers and Parliament. There has been a sort of contract entered into between the two. The railway has been made and certain powers given to the railway company. Would it then be just on the part of Parliament to interfere and say, we made an improvident bargain with you; we think that you are acting improperly under the contract, and we are going to take the railway from you, without giving you any equivalent?—I am not sure that it would be just, unless the circumstances were so completely changed as to make it necessary to do so. We do find in various matters that Parliament does see fit occasionally to alter the arrangements that were made at some previous time, in consequence of circumstances having become altered.

669. In the case I am referring to, people have laid out their money upon the faith of the Act of Parliament. Having so laid out their money and made the line, would it be just in Parliament to say, "You "have done that, it is true, but we cannot help that; "you have acted improperly, and we will take the rail- "way from you, or we will alter your rates without "giving you any equivalent?"—That is a matter that I have not gone into to any extent; but what we ask for is that there should be equitable rates made over all the lines; that we should not be charged one rate to Birmingham and another rate to another town by the same company.

670. You say that the Act of Parliament has given the railway company power to make certain charges within certain limits, and Parliament has said, within those limits we give you full powers. Upon the faith of that understanding the railway has been made, and then the company makes certain arrangements within those limits, which you say are not equitable, but which the company say are equitable. Would it be just for Parliament to interfere, and say, "It is clear "that you are acting in a way that is mischievous to "A. B., although it is advantageous to yourself? "You have made an agreement with us, and we are "very sorry that it was made, and we will annul it?" —Does it then follow that an arrangement made in the year 1830 is to last for all time. Is every Act of Parliament granted upon such considerations? Has not Parliament always the power to step in to see that an equitable arrangement may be made, according to the altered circumstances of the time? Every person who obtains an Act acquires his property subject to the will of Parliament.

671. Is it the opinion of the trade of Birmingham that Parliament has the power, and would be justified in using it, to revise the rates charged by the railway companies, and do they think that the time has come for exercising that power?—I think, as far as I have been able to ascertain, that that is the feeling of the trade generally in Birmingham.

672. (*Mr. Ayrton.*) Do they think that it should be exercised without reference to the dividends to be

Mr. J. S. Wright.

5th April 1865.

paid to the shareholders?—I must confess that that is a matter which I have not looked into or considered at all; but we feel bearing very heavily upon us the differential rates of carriage from Birmingham to different places. We feel that it is driving trade from us, and driving it also, in some instances, from the country. We, therefore, consider that so great an evil that the matter calls for the attention of Parliament.

673. (*Sir R. Hill.*) Speaking as a member of the Chamber of Commerce in Birmingham, I understand you to say that the trade of Birmingham, and probably, in your opinion, the trade of the country, suffers very considerably from two causes. First, that the rates charged upon the same goods vary very considerably where the distances are practically the same; and, secondly, that the railway companies raise those charges without reference to the state of trade in the country?—Yes; they do not revise them, which is the same thing, according to the altered value of the goods.

674. Without considering at the moment whether the Legislature has provided for a proper revision I presume that in your opinion it is very desirable, with reference to the trade of the country, that such a power should exist somewhere?—We feel so, undoubtedly.

675. If that has not been granted, you think that it should be granted?—That is our feeling generally.

676. If means could be devised by which, without injury to the profit of the railway companies, such a power of revision could be granted, to secure equal charges for equal distances, and further, that the charges should not be arbitrarily raised, you consider that such an arrangement would very greatly benefit the trade of the country?—Yes, and especially in the case of Birmingham being an inland town, it would be very important to us, lying so far as we do from the sea coast.

677. (*Mr. Roebuck.*) You have pointed out certain differences in the charges; I want to know whether you can suggest to the Committee any cause of the difference. I think you said that goods carried to Sheffield were charged 40*s.* a ton, while goods carried to London were charged only 21*s.* a ton?—Yes.

678. Can you suggest any reason for that difference?—The best answer, I think, that I can give to that question is one that I believe was given by the chairman of the Midland Railway Company some time ago to parties who were largely interested in the trade of Sheffield. The Sheffield people, I believe, had complained very much of the high rates to Sheffield, the matter being entirely in the hands of one company from Birmingham; and he said, "although we are obliged on various occasions to "compete and to charge very low rates; where we "have the power of charging a high rate, we are "obliged to do so, and we take advantage of that in "order to make up a dividend for our shareholders."

679. So that in fact the price is raised to Sheffield, because from Sheffield to Birmingham there is only one railway?—Yes.

680. You just now stated that there was mischief arising from two railways running to the same place where one railway could do all the work?—Undoubtedly there is; at the same time, when one railway has the whole power in its hands, it may charge an excessive rate, as in the case from Birmingham to Sheffield; and that stands out, bad as the case may be from Birmingham to London, as a very much more flagrant case of high rates. I do not know that we should be any better off if there was a second line to Sheffield. I think possibly, judging from our experience of other lines, that we should have quite as high a rate, if not higher, if we had a second line to Sheffield.

681. (*Mr. Horsfall.*) You complain of the comparative rates between Birmingham and Bristol, and between Birmingham and Liverpool?—Yes, for the same distance; we think that the rate is very much higher, for instance, to Liverpool; it is 12*s.* 1*d.* for the lowest class of goods to Bristol, and 16*s.* 8*d.* to Liverpool.

682. What is the comparative mileage?—The mileage is about the same.

683. Can you at all account for the difference in charge?—No, save that the Midland Company, in certain districts, charge very low rates. We have no complaint to make about the rates from Bristol and that district to Birmingham. To Sheffield, on the contrary, they charge very high rates, as compared, for instance, with the rates from Newcastle, the goods coming over part of their line, and the rates from Hartlepool, which are very much lower than the rates from Sheffield.

684. (*Mr. Roebuck.*) Is the rate between Birmingham and Sheffield higher than between Birmingham and Bristol?—I should think that the rate was the least between Birmingham and Bristol rather than between Birmingham and Sheffield.

685. (*Mr. Ayrton.*) The rates which you have given are not confined to one railway, but they are applicable to different railways?—The Midland Company for instance, and the Great Western Company, charge the same rates to Bristol.

686. What I mean is that your comparison has not been made upon the same railway, but upon different systems of railways?—There is the same system I think from Birmingham to Bristol as from Sheffield to Bristol, the lines being held by the Midland Company.

687. But the figures which you have given are not confined to one railway?—No; but sometimes by one railway; for instance, from Birmingham to London a very high rate is charged. For provisions carried from Liverpool to Birmingham, that being a line in the hands of the London and North-western Company, there is a very low rate from Liverpool to Birmingham.

688. You would, I think, propose that all railway companies throughout the country should charge an uniform mileage rate for carrying the same quantities over the same distance?—Yes, with perhaps some modifications. As to the seaboard, we do not think it would be required, possibly it would be otherwise. We think that a graduated mileage rate, with fixed terminal charges, would be an approach to an equitable system.

689. But that it should be uniform throughout England?—Yes.

690. And Scotland?—We think so, throughout the country.

691. Throughout the United Kingdom?—Yes; as far as it was possible.

692. What would be the exception as to the seaboard?—There may be an exception that railway companies will find it necessary to charge a lower rate from Edinburgh to London possibly, because of the competition with the seaboard, than by a line of railway at the ordinary rates.

693. Then you would recognize the fact of competition existing between a railway and the sea coast as a legitimate ground for compelling them to take a lower rate, or allowing them to take a lower rate?—I do not know that that should compel them. Where there is competition between railway companies it works efficiently and does all that we require; it is where there is no competition that the public suffers, and when this comes in the shape of a monopoly we think that we have reason to complain.

694. Would you allow all railway companies to carry at a lower rate if they chose than that which was regulated throughout the country?—We think that as far as possible, both in the interests of trade and of the companies generally, it would be better to have as nearly as possible an equitable uniform rate.

695. Am I to understand that you would allow them to take less if they were so disposed?—I think so.

696. Any company might take less if it were so disposed?—Yes.

697. Is not that exactly what the present system is?—No; the present system is to make very high

rates and very unequal rates over the lines of railway running to places similarly situated.

698. Are they not by law prohibited from charging higher rates over the whole line than rates of a certain amount?—Yes; there is no doubt that the law has given them a maximum, but that maximum was established some years ago, and we say that these rates want revision.

699. Inequalities are produced, are they not, by the railway companies voluntarily departing from the maximum?—It may be so in some instances, by charging lower rates in some districts and making other districts pay for it.

700. You would have the present maximum rates diminished?—I think it would be but reasonable to do so.

701. Leaving in other respects the railway companies at liberty to make such a reduction from the gross maximum as they pleased?—It would possibly be found to be right to do so. At the same time my feeling is towards as nearly as possible an uniform graduated mileage rate.

702. Do the Chambers of Commerce mean that the railway companies are to have a maximum rate fixed, and taht they shall be compelled to charge that rate whether they like it or not, and that they shall not be allowed to reduce it if so disposed?—I think it is possible they would hold that there should be a maximum rate.

703. Leaving the companies at liberty to reduce it in some cases if they thought fit?—Yes; I have given you as an exception the seaboard.

704. (*Chairman.*) Would you not allow of another exception; for instance the route from Birmingham to London by the Great Western line is longer than that by the London and North-western line?—Yes; I think in such cases that the shortest route should be taken where there are competing lines to the same point, otherwise you might take a very circuitous route. As for instance from Birmingham by the Great Western line to Bristol, in which it case it would not be right to charge that mileage. It would destroy itself if they did that, because the traders would send by the shortest route, and I think it would come as a matter of course to charging the rate by the shortest route.

705. (*Mr. Roebuck.*) I gather from what you have stated that you attach great importance to a uniform rate?—Yes.

706. And you desire not to have various rates charged over the same line?—Yes, for the same class of goods.

707. And carried for the same distance?—Yes.

708. (*Mr. Horsfall.*) Are you aware of any special reason for the rates being lower between Birmingham and Hartlepool than between Birmingham and any other part of the country?—I have heard that it is in consequence of one of the railway companies having obtained a large amount of property in Hartlepool, and therefore having some special interest in the place, they make the rate low from Hartlepool to the different inland districts.

709. Are you aware whether any docks are being constructed at Hartlepool by any of the railway companies?—Not of my own knowledge. I have heard that there are docks being constructed either in whole or in part by the railway companies.

710. (*Mr. Ayrton.*) You have spoken of the increase of rates being attributable to the fact of two competing lines having been established; are you quite sure that there is no other cause to which that increase of rates might be attributed, such as the increased expense of working the railways?—I have given you a most marked and very clear instance upon that matter; that when the two railways were constructed and parties could send their goods by either line between Liverpool and London or between Birmingham and Liverpool, then the rates were raised to 20*s.* a ton. Immediately upon the opening of the Great Western line, hardware goods were raised from 17*s.* to 20*s.* a ton.

711. (*Mr. Roebuck.*) I suppose that the increased expense of working a line would not affect the prices as between one town and another, say A. and B., on the same line more than between, say, C. and D.?—I should think not.

712. (*Lord Stanley.*) Do not the railway companies always charge rates that are most profitable to themselves?—It may be that they charge them to the limits frequently; they possibly do so in order that the trade may not be actually destroyed, but that makes it frequently unjust. We must send our goods from Birmingham to London, however high the rate is, and the company get the benefit of that, although they may have given a low rate in other districts, which may not have paid them, so that they get a dividend out of the higher rate which is charged between certain places and certain districts.

713. Would not the directors of the company be bound to charge those rates within the margin allowed them by Parliament which would return the greatest profit to the shareholders?—They cannot always tell that. The tendency, we find, is to increase the rates whenever they can do it, and wherever it can be done without positively destroying the trade.

714. That is the principle which every railway company acts upon, is it?—I am afraid that it is a principle common to all persons in trade.

715. That being the principle, how could two railway companies increase their rates so as to pay two dividends instead of one. I understand you to say that when two railways were established the reason why they increased the rates was because they had to pay two dividends instead of one?—It appears to me that if you take the instance between London and Birmingham we could have our goods carried it may be at 15*s.* or 20*s.* a ton, by the London and North-western Company, if there was only one line, and that would pay them a higher dividend than a rate of 27*s.* 6*d.* when there were two lines, because the two lines would, of course, have to be constructed, with all the contingent expenses, and the two lines must be worked. But supposing that one line could take all the goods that might be required to be sent, although they might advance the rates charged for carriage, they might not get so large a dividend as before. In the case of the Grand Junction line when its dividends were 10 per cent. the rates of carriage between Birmingham and Liverpool were only 13*s.* 4*d.* Neither the Great Western Company nor the London and North-western Company are making the same dividends now, although they charge 20*s.* a ton, and naturally they will look to increasing the rates upon the goods traffic, and passengers, where they can, if it does not disturb the amount of traffic, with the view of increasing their dividends. It is to an increase of the rates that they look for an increase of dividend.

716. (*Chairman.*) Have you ever inquired what the dividends of the London and North-western and Great Western Companies would be if they carried traffic now from Birmingham to Liverpool for 13*s.* 4*d.* per ton?—Undoubtedly they would receive a very much smaller dividend than they now get.

717. (*Mr. Roebuck.*) Supposing the traffic to increase?—Trade will increase from various causes, but it does not follow that a lower rate on any particular article of manufacture will immediately cause a large increase in the consumption or in the goods carried. In the case of grain we have been informed that it prevents the high rates, but in some cases of grain being carried from one town to another, there it might develop trade, but that would scarcely be so in the case of manufacturers.

718. You will probably remember the remarkable increase in the number of letters carried after lowering the rate of postage charged upon letters, but is there any analogy between that case and the case of trade?—There is, but to a much smaller extent. You can increase the quantity of writing at your pleasure, you can travel more at your pleasure, but you do not increase trade just in the same proportion.

Mr. J. S. Wright.

5th April 1865.

719. Supposing that a reduction of the rates increased the number of passengers, confining your attention to that first of all, do not you think that lowering the rates of transit for passengers would increase the number of travellers?—Very much no doubt.

720. Do you think that that effect would be less in in the case of goods?—It would take a longer time to develop, and it would certainly not be in so marked a way as in the case of letters, or in the case of travellers.

721. Take coals, for example, where the charge for transit enters very largely into the price, do you not think that a reduction in the price of coals, consequent upon lowering the price of transit, would very much increase the consumption of coals?—My remarks have been mainly directed to manufactures, but no doubt, in the instance that you have given, much larger quantities of coal would be consumed by lowering the price; parties are much more careful in small households with regard to the consumption of coal if they are at a high rate than if they are at a low one.

722. Do you not think that the same thing would happen in the case of grain?—I instanced grain as one of the cases in which the increase would probably be more marked than in the case of manufactures; but still, in the case of manufactures, heavy articles, such as copper, a large quantity of old copper is brought into this country, and is brought to Birmingham and made up; it is re-manufactured, and rolled into sheets, or made into a variety of things. That trade, however, will, we apprehend, leave Birmingham, and be carried on close to some sea port, which it might not do if there were a low rate of carriage to Birmingham. Again, in the case of iron wire, there is a very extensive manufacturer in Birmingham who formerly supplied his customers with that article at Hamburg and Amsterdam, but which trade he has entirely lost, in consequence of those parties being now supplied with iron from Liège, in Belgium.

723. Take the case of iron wire; supposing that the rate of carriage was very much lowered, would not that lead to a very great consumption of iron wire for fences and a variety of other purposes?—Lowering the rate would, as it has already done in other cases, tend to increase its consumption.

724. Applying that again to railways, would not the lowering of the rate increase the quantity of goods carried?—I have no doubt it would to some extent as to manufactures, but the increase would be less marked than in the case of passengers who can travel at their will.

725. (*Mr. Horsfall.*) I believe that some dissatisfaction is felt at Birmingham as to the charges which are made upon travellers' patterns?—Yes, travellers carry from Birmingham in the hardware trade a considerable weight of patterns, and they are charged as they consider too large an amount for the carriage of those patterns. They consider that they ought to be encouraged to carry patterns with them to the greatest extent, because that would tend to increase the trade. They have long felt this to be a hardship, and they have memorialized the railway companies, but without any result.

726. (*Lord Stanley.*) Will you explain what you include under those terms "travellers' patterns"?—I will. Suppose that a traveller from a hardware house goes out on his journey, he would take with him samples of knives or locks, or small hinges, or brass ornaments for blinds and things of that sort. and suppose that that traveller goes beyond a distance of 30 miles, upon some lines of railway he would pay a farthing a pound, for the excess of luggage, while upon other lines he would have to pay a halfpenny per pound for all patterns.

727. (*Mr. Lowe.*) They are charged, I suppose, as luggage?—Yes, and there are some curious anomalies which sometimes occur in that way. A short time since a traveller in Lancashire was charged from one station to another, they being only two miles distant, an excess for luggage amounting to 5*s.* 6*d.*; he inquired what the charge would be to the next station, which was six miles further on, and he found that it would be only 3*s.* 9*d.* to that station, although the distance was three times as great.

728. (*Mr. Roebuck.*) Can you suggest any reason for this charge being made?—The reason that the railway companies allege is, that the travellers require, when these patterns are sent separately to individuals, that they shall be more punctually delivered, and that they require to be taken care of.

729. Can you suggest any reason for the disproportion that existed in the two cases you have mentioned?—No.

730. Then it might possibly have been from inadvertence?—No, for the person to whom I have referred made strict inquiries as to the matter of the parties in charge, and they said that they had no power to alter the charge.

731. (*Chairman.*) Have not instances occurred in which travellers have brought actions against railway companies for the loss of their patterns, and in which they have recovered heavy damages?—I think it is possible that they would recover heavy damages for the loss of their patterns. The common law, I presume, would give them that power, that if a railway company loses anything they are responsible for it.

732. Is it not possible that these high charges for travellers' patterns are made in order to cover the risk?—Practically, the risk is nil. A case occurred to myself only the other day when sending a number of boxes of goods to Belfast; we wanted to have them delivered soon, that is, that there should be no unnecessary delay; my traveller was to follow the goods, but they charged us, on the plea that they were samples, 70*s.* per cwt., instead of the ordinary charge of 40*s.* as being common merchandise.

733. Did you send them by the same train?—Yes.

734. (*Mr. Roebuck.*) So that for what you call patterns, although they were not luggage, they charged the price for luggage?—They charged 70*s.* for the patterns, supposing that they were taken as samples, instead of the ordinary charge of 40*s.*, as if they were only ordinary goods.

735. They were not included in the traveller's luggage?—No; they were sent separately from him.

736. It was on the plea that they were patterns that the extra charge was made?—Yes.

737. (*Chairman.*) Were the goods invoiced to your customers?—No; they were sent on before my traveller, with the view of his selling them to my customers.

738. (*Sir R. Hill.*) Would the railway company have been required to deliver those patterns more rapidly than usual?—Yes; we wanted them to go without delay by the ordinary goods conveyance.

739. (*Mr. Horsfall.*) You probably have not sued the company, owing to the expense that you would have to incur in doing so?—The matter, in point of fact, is in abeyance. They have not yet allowed it; but I should mention that a large number of claims are abandoned in consequence of the disinclination of the parties to go to law with these companies. They feel that they would be placed at such a disadvantage, private individuals, as compared with a large company, that there are very few claims that are ever carried into a court of law.

740. (*Mr. Ayrton.*) What disadvantage would there be in taking a small claim into a county court, as between a railway company and an individual?—There is not any very great disadvantage in that, but there would be a great disadvantage in trying to recover a large claim.

741. (*Mr. Roebuck.*) Are not many actions brought under Lord Campbell's Act against railway companies? My information from the Birmingham trade is that we very rarely go to law with a railway company. We abandon small matters, and compromise our claims, when we consider that we have been treated unfairly, rather than go to law.

742. (*Mr. Roebuck.*) I suppose you do not want to incur the displeasure of the railway company?—That

might be one reason, but it is chiefly from a disinclination to go to law.

743. (*Sir R. Hill.*) Have there not been instances in which actions have been brought against railway companies, and verdicts obtained against railway companies, and yet they have pursued the same course, and actions have been brought against them again and again. I am referring now to packed parcels?—Yes. Action after action has been brought by the parties, and an enormous expense has been incurred by parties who considered that they had been aggrieved.

744. Although, in each instance, the verdict was in favour of the complaining party?—Yes.

745. (*Mr. Gower.*) Have you any remedy to suggest for this state of things?—No; I cannot say that I have. It has not occurred to me to suggest a remedy. My attention has been directed entirely to the trade and its grievances, and I have not considered what the remedy would be.

746. (*Chairman.*) You have mentioned that the railway companies are in the habit of shifting goods from one class to another. Have you any suggestions to make to the Commission as to any regulations which ought to be made in the classification of different articles?—We think that if there was some controlling power, and if there was a periodical revision of the rates charged, that would be a remedy, and that they should be prevented from changing from one class to another without the sanction of the controlling power.

747. (*Mr. Ayrton.*) And that they should only be allowed to shift within the limits of the permission given by their Act of Incorporation?—Yes; to be kept within those limits.

748. You mean that a railway company should not be allowed to shift goods from one class to another, in violation of their Act, but to exercise the discretion given to them by that Act in a satisfactory way to you?—Yes.

749. (*Mr. Roebuck.*) I think you complain of the Act as well as of the individuals?—Yes.

750. (*Mr. Ayrton.*) Has the Chamber of Commerce at Birmingham considered how this control which you have suggested is to be exercised?—No; that has not been discussed or considered by them.

751. (*Capt. Galton.*) Does the Chamber of Commerce at Birmingham ever make representations to the railway companies as to what they may consider a grievance?—I have already given you one instance.

752. But, as a rule, they do not make many representations, I suppose?—No.

753. (*Mr. Lowe.*) Are your railways very heavily burdened with traffic?—I can hardly answer that question relatively. There are large quantities of goods carried from Birmingham and the district. We have developed in Birmingham within the last 30 or 40 years a very large number of new trades, which has caused a very great increase in the amount of goods carried.

754. (*Mr. Horsfall.*) Do the lower rates which are charged to Hartlepool, in your opinion, divert the trade from any other places?—We believe that the rates charged to Hartlepool divert the trade from Hull to a very considerable extent, Hull being the port to which goods would go from Birmingham; but they can get the goods carried cheaper to Hartlepool, and from having that lower rate to and from Hartlepool, goods are diverted from Hull.

755. (*Chairman.*) You mean, I suppose, goods intended for the Baltic or the German ports?—Yes.

756. The lower rate to Hartlepool tempts traders to send their goods that way instead of *viâ* Hull?—Yes.

757. (*Mr. Ayrton.*) How far do the rates which you have mentioned include the shipping charges or dock dues?—In most cases, I believe, they deliver the goods alongside, except in Liverpool; then there is cartage and delivery, which are always charged separately.

758. Therefore the inequalities, to some extent, result from the different dock rates which are charged?—Liverpool is the only case in which there are separate charges for cartage and for delivery.

759. (*Sir R. Hill.*) As between Hull and Hartlepool that consideration does not apply, does it?—No. The charge made includes dock dues and cartage in Hartlepool, Hull, London, and Bristol; in fact, in all places except Liverpool.

760. (*Mr. Roebuck.*) They are called station charges, are they not?—I believe that there are not any station charges now; the rates at Liverpool continue for all the ordinary class of goods. There are special articles which are delivered from station to station, such as guano and manure, and perhaps timber, which are taken from station to station; but my observations have generally been confined to hardware goods; and, therefore, they are all placed upon the same level.

761. (*Chairman.*) Is there any other statement or remark which you wish to make to the Commissioners?—I think there is only one, and that is, as to classification. The classification itself is very imperfect with regard to certain articles. The classification is supposed to be based on the relative value of the articles, and that evidently needs revision; for instance, in the first class tin will be found, and in the second class, at a higher rate, brass will be found. tin being frequently, or as a rule, higher in value than brass. Again, there is nitrate of soda, and, I believe potash as well, going under the same head in the first class, while vegetable ivory, blacking, and similar things are in the second class. Then I may instance another article, currants, which are in the second class, while sugar is in the first class; sugar, in many instances, being of much higher value, quite as difficult to move about, and in many cases more difficult to move about than currants, and yet it is placed in a lower class. I think that these things are very unequal, and that they want revision and a classification of the different articles.

762. (*Mr. Ayrton.*) Do you consider that value is the only ground for classification—are there not several other elements to be taken into account?—I believe that value is the main element; there are other elements that would come in, such as the convenience of moving an article and the density of it.

763. (*Chairman.*) And the liability to damage?—That is so. I think that the value would be a ground for putting it in a higher classification, because it was more liable to damage.

764. (*Sir R. Hill.*) Must not bulk also be taken into account?—Yes.

765. (*Mr. Horsfall.*) Have representations been made to the railway companies as to the inequalities of their classification?—Remonstrances have been made to the railway companies from time to time by individual traders interested in the matter; but my own experience has been, and that of the various traders with whom I have conversed, that these representations are taken no notice of. You are told that it is a matter which is decided in common with other companies in London at the clearing house, and you get no remedy in the matter. With the exception of the one instance that I have given, I do not know that any modification that has been sought for has been obtained by the private traders.

766. (*Capt. Galton.*) You have stated that the value of glass is now much smaller than it used to be, that formerly it was worth 11*l.* a crate, but now it is only worth 2*l.* You also stated that the rate is the same, and that it is higher than when the glass was carried by canal. Is that so?—Yes.

767. May not that arise from the fact that the glass carried by the railway company is much more liable to be injured?—But they will not allow a claim, and they will not be responsible, unless you pay such a rate as is in point of fact prohibitive of the trade.

768. That is to say, unless you pay an extra insurance rate?—Yes; unless you turn it from a third-class to a fifth-class article, and then that difference

Mr. J. S. Wright.

5th April 1865.

in the rate would be prohibitive of the trade. Formerly persons engaged in the glass trade got their claims settled when it was taken by water carriage without difficulty, but they were not to any very large extent. Now the largest dealer in glass in Birmingham tells me that his breakages are somewhere about equal to 2½ per cent., but he never gets that allowed by the railway company. I refer to Messrs. Stoke, Brothers, and Taylor.

769. The railway company never allow for the breakages?—No, unless the articles have been put in the prohibitive clause.

770. (*Sir R. Hill.*) Does not the law, if appealed to, enforce the payment of damages on the part of railway companies?—One of our friends lost a case the other day, although he had already paid what he thought was a very high rate, and yet he did not recover the damages that were claimed.*

771. (*Mr. Ayrton.*) A railway company is allowed to charge a higher rate, and they agree to reduce it, provided no claims are made upon them for breakages? Yes; but still that rate is higher than it formerly was by the canal, and then we had the breakages allowed for. The case that I have referred to was a case in which a very thick sheet of glass having been raised up was let fall upon the ground, and consequently every square inch of the glass was broken; it was of very considerable weight, and the party got no damages. The ordinary mode of carrying it would never have injured it, and they lost their case.

772. (*Mr. Roebuck.*) Under the pretence of making reimbursement to persons who suffer in this way they increased the charge made; but when the misfortune happened they did not make that reimbursement?—That is the information I have received.

The witness withdrew.

Mr. C. D. Sturge.

Mr. Charles Dickinson Sturge examined.

773. (*Chairman.*) I believe you are a corn merchant at Birmingham?—Yes.

774. And you deal extensively in foreign grain?—Yes.

775. Have you found that your business from the various seaports is affected very much by the charges that are made by the different railway companies?—Yes, for the quantity of corn taken into the internal parts of the country almost entirely depends upon the railway rate that is charged; for instance, a person will buy or not buy according to the price. 6*d.* or 1*s.* advance in the price will prevent him from buying; 6*d.* a quarter would be equal to 2*s.* 3*d.* a ton, so that if a railway company add 2*s.* or 3*s.* to the rate, they will frequently prevent business being done.

776. They have it in their power to encourage the corn trade to particular seaports, and to discourage it from going to others?—Yes, completely so; our business is almost exclusively from Gloucester; our warehouses are there, and Gloucester being the nearest port to the South Staffordshire collieries and to the Midland districts, it is the natural port to import through. Our rate has usually been from 5*s.* to 7*s.* by railway from Gloucester to the collieries, where the consumption of grain is rather more than that in Birmingham; but in the month of January 1854 the London and North-western Railway Company raised the rate to 10*s.* a ton, making it the same as to Liverpoool, which shut us out from that district, Liverpool being the leading port is always rather the cheaper place of importation. A shipowner prefers to send his vessel to the principal port of the country at rather a lower freight than elsewhere.

777. (*Mr. Horsfall.*) They have diverted the trade from the natural port to Liverpool?—Yes; they have diverted it from Gloucester to Liverpool, and instead of importing foreign grain through Gloucester, that which is purchased in the collieries was for a time principally obtained from Liverpool.

778. (*Chairman.*) You allude I suppose to Dudley and that district?—Yes; Dudley, Wolverhampton, and that district.

779. (*Capt. Galton.*) Have not the Midland Railway Company the control of the line between Birmingham and Gloucester?—To Birmingham, but not for the delivery of goods into the collieries.

780. You say that London and the North-western Company charged a high rate?—Yes; they charged 10*s.* a ton; the rate from Gloucester to Birmingham was 5*s.* 6*d.*, but by charging 10*s.* they charged nearly equal to two local rates.

781. Could not the grain have been brought by canal?—The London and North-western Company guaranteed to the Birmingham Canal Company a dividend of 4 per cent., and consequently have a control over the canal, and they will not allow the rates to be reduced; they charge a penny per ton per mile, and it is a high rate for tonnage, as there are the expenses of the boat and the horse hire as well.

782. And that rate is prohibitory of your trade?—It checks it very much. We have two boats on the canals, but it makes delivery for any distance along the Old Birmingham canal very expensive.

783. (*Chairman.*) Has this alteration in the rate rendered your warehouse property at Gloucester much less useful to you?—It would have done so, but by the opening of the West Midland line soon afterwards the rates were reduced to the old level, and they have continued so ever since. The West Midland line, by an amalgamation with the Great Western Company, has now passed into the hands of the Great Western Company, who are also interested, like the London and North-western Company, in the Liverpool traffic, and they have it in their power to return to the old rate; but they have not yet done so. There is nothing to prevent them from doing so at any time, and send in the traffic of the colliery districts to Liverpool in place of Gloucester.

784. Your complaint is, that by the existing powers which railway companies have, they can, at their pleasure, divert the trade from the port to which it would naturally go to any port they please?—Yes, and to a more distant one, as has been done to a great extent in the West Hartlepool case in the north of England, and which renders our warehouse property of very uncertain value.

785. Can you give the Commission any evidence as to the effect produced upon the value of land in the neighbourhood of Birmingham by the facilities which

---

* The following is the parties' own account of this case:—

"Glass and Lead Works,
"Gas Fitting and Plumbers Brass Foundry,
"Birmingham, April 12, 1865.

"We sent a case about eight feet square containing two panes of glass, called rough cast plate, and one inch thick.

"This went by the Great Western line, and was addressed to Wrexham, and forwarded at the senders' risk rate.

"Before it left Birmingham, from some cause, which we called *carelessness*, this heavy case was allowed to fall down and the glass smashed to small pieces, and while in the Company's care.

"The Company declined all liability to our claim, although the law had settled, in one or two similar cases, that for *carelessness* the Company were liable, and were made to pay.

"The non-liability rate only covering ordinary damage arising in the way of transit.

"We tried the case before the Judge of the County Court here, and the whole case was gone into fully, when the Judge proved that the damage arose by *accident* and not otherwise, while we maintained that it was the defective machinery employed for removing so large and heavy a case or the unfair way of handling it, otherwise the glass could not have been so smashed.

"For this and all glass so sent, we are charged at second class rate, and this higher rate for carriage we consider is to cover the risk, otherwise the extra rate becomes an imposition. The Judge seemed to take a very different view of the case when being tried to that of a jury, and we are convinced, had a jury tried it, we should have had a verdict.

"The first-class rate to Wrexham is 15*s.* a ton.

"The 2nd class ditto 20*s.* a ton, being one-fourth more."

have been afforded by the railway companies, or otherwise?—The Great Western Railway Company, since they opened their line into Birmingham, have given a good deal of attention to the local traffic, and at the three first stations on their line, Acock's Green, which is four miles, Solihull, which is seven miles, and Knowle, which is 11 miles, the land now sells as building land; but on the Midland line, at their first station, King's Norton, which is at a distance of seven miles, land was sold a year or two ago at 60*l.* an acre, and near the station, more recently, at 80*l.* an acre.

786. (*Capt. Galton.*) The Midland Company, I believe, give very little accommodation?—Very little. They have five trains running a day, which stop at King's Norton, and those are regulated by the through traffic.

787. (*Chairman.*) Do they run no special trains?—No.

788. And the consequence is that upon the Midland line the value of property has not been increased?—Not at all, I think. I think you could get land, if there was any for sale, within a quarter of a mile of the King's Norton station, at the same price as two or three miles off.

789. You do not think that it is part of the duty of a railway company to look after the interests of the owners of land, and so regulate their traffic that they shall raise the value of their land?—No; but of course, as a railway company takes land compulsorily, it is, I presume, on the understanding that the railway company shall do their best to develop the trade.

790. (*Mr. Ayrton.*) They pay for what they take, do they not?—Yes, they do; but still it is done under compulsion. The landowner has no alternative.

791. (*Capt. Galton.*) Is not this your view, that you think the railway company is bound to develop all the traffic it can, and to the utmost extent?—Yes.

792. Where land is not increased above the ordinary agricultural value at any station, it shows, does it not, that the arrangements for facilitating the traffic there are not in a satisfactory condition?—Yes.

793. (*Chairman.*) You confine your remarks to the stations within the neighbourhood of a great town like Birmingham?—Yes.

794. Do you not think that the directors of a railway company may fairly say that they are trustees for their shareholders, and that their principal duty is to make as large a dividend for them as they can?—I should have thought that they had some other duty, and that compulsory powers to take land are given on the understanding that they will perform some duty to the public, instead of increasing the rates to the public.

795. (*Lord Stanley.*) Are not those compulsory powers granted to the railway companies upon the understanding that they shall not be allowed to charge more than a certain rate for the goods they carry?—Yes, they are, certainly.

796. Is not that a consideration from which the public derive a benefit?—Yes, it is; but still, as the country progresses, and as railways become of more importance, they more depend upon the development of traffic.

797. (*Sir R. Hill.*) Do not the railway companies pay a much higher price for land in consequence of their having compulsory powers granted to them; and in determining the amount to be paid by a company for land required for stations and other purposes, is not the fact that the owner of land is obliged to sell his land invariably taken into account?—I suppose it is; but I think that that depends rather upon the surveyor, or the party with whom the settlement of the amount rests—the amount allotted to him.

798. Does it not follow that the landowner has no claim upon the company to cultivate traffic in his particular neighbourhood?—He has this claim, I think, that when the railway is once made no one is allowed to make another, or in the same direction.

799. (*Mr. Ayrton.*) Are there not circumstances which have induced people to set up works and build houses on one side of Birmingham and in one direction rather than in another?—I think that people are principally guided, referring now to manufactories, by the supply of coal.

800. And also with reference to building houses?—A person who is building a house generally selects the side opposite to the collieries.

801. Therefore there is a disposition in Birmingham to build residences on one side of the town rather than on the other?—Yes.

802. (*Capt. Galton.*) King's Norton, however, is removed from the smoky part of the district, is it not?—Yes.

803. And it affords a very good building site?—Yes.

804. The country is very picturesque is it not?—It is most picturesque, and very well calculated for building altogether.

805. (*Mr. Horsfall.*) As being interested in the trade between Birmingham and Gloucester you do not complain of the rates charged by the railway companies between those two towns?—We complain of the power which they possess to divert the traffic in another direction, if it suits the railway companies to do so.

806. Is it the fact that the railway companies divert the traffic from Gloucester to any other place?—Not at the present time, but in 1854 there was an attempt to do it, which was not carried out in consequence of the opening of the West Midland line.

807. You are not aware that other towns complain of the trade being diverted from those towns to Gloucester, from Birmingham?—I am aware that there was a memorial prepared by the Liverpool Corn Association on the subject.

808. Have you seen that memorial?—Yes, I have a copy of it here, and there is one important point. They approve of 2*s.* per ton for terminal charges, that is, 1*s.* a ton at each end, but they do not seem to be aware that in Gloucester the merchant loads the trucks, and they never go into the station at all, the whole of the loading is done by the merchant, and consequently there is a very slight terminal charge made.

809. Is that not so at Liverpool?—I believe it is all loaded in the station there; it is carted up and loaded in the station.

810. That is done by the merchant is it?—No, it is carted up and loaded by the railway company's servants in the station.

811. Where do you say the difference is?—The difference is this, that at Gloucester the trucks are sent down to the docks, the merchant loads the trucks, and the railway company has no further trouble or expense than sending the trucks down.

812. The merchant loads them?—Yes, at Gloucester, but not at Liverpool.

813. (*Mr. Ayrton.*) Are the delivery trucks fully laden on the line for transmission to Gloucester?—The railway companies send down the trucks by an engine, and then they have one or two horses which are used to move them to the warehouses; after which they have nothing further to do with them than to receive a consignment note.

814. (*Mr. Horsfall.*) Do you think that the mere expense of loading a truck constitutes the whole grievance of which the Liverpool corn merchants complain?—That constitutes part of the inequality. The London and North-western Company's rates are, as they think, much higher than the Midland Company's rates, and many of the London and North-western Company's rates from Liverpool certainly are very high.

815. (*Chairman.*) Have you had any experience of the expense of opposing bills promoted in Parliament by railway companies?—I cannot say that we have had any personal experience: but I may

Mr. C. D. Sturge.
5th April 1865.

mention that the Great Western Amalgamation Bill was almost universally opposed by the merchants of the district, without having any effect or any restrictive clauses being inserted, except one about the per-centage of the dividend.

816. To what amalgamation bill do you refer?—I refer to the amalgamation of the West Midland Company with the Great Western Company. That was a circumstance that affected our district, because it gave the Great Western Company the control over both the South Wales lines and also the West Midland line running into the Midland districts.

817. It was opposed, was it not, by the Birmingham Chamber of Commerce?—Yes; they sent up witnesses; it was more particularly opposed by the merchants of Cardiff and Gloucester.

818. Did you take part in that opposition?—Yes, I did.

819. Did you not find that that was very onerous in point of expense?—There is no doubt that any opposition to be successful would be attended with very great expense, unless the parties were supported by some railway company. In a bill promoted by the Great Western Railway Company and the South Wales Company, it is proposed to cross the Rivern Severn below Gloucester, which will to a great extent impede the navigation of the river. It is opposed generally by the town of Gloucester, and we had occasion a few weeks ago to ask for a valuation of the property at Gloucester, and the answer that we received was, that at that present time no one would think of valuing or buying any property there until the result of this bill was known.

820. That, I presume, arises from a fear that the port of Gloucester would be injured by the proposed bridge?—Yes.

821. Does it not also arise from the fact that the through traffic from London to South Wales will be diverted across the bridge, and not go through the town of Gloucester?—No, that traffic only goes to the station, and I do not think that it affects the prosperity of the town at all.

822. (*Mr. Ayrton.*) If, on the one hand, you complain of the difficulty of opposing a railway company, is not that equally applicable to the parties who are interested in seeing a railway bill carried, and in supporting it till it is carried. Is not the difficulty equal on both sides?—That is, when a bill is supported not by an existing company but by a new one.

822. I presume that all the inhabitants of South Wales, along the Bristol Channel, may be supposed to be extremely interested in having the route to London shortened by the construction of a bridge over the Severn, excluding Gloucester. Is not it equally difficult on their part to support the line as for the inhabitants of Gloucester to oppose it?—But I suppose that it is supported by the funds of the Great Western Company.

824. (*Chairman.*) What you mean to say, I think, is, that when one of these projects is put forward by a powerful railway company, they have a great advantage over the scattered efforts of private opponents?—Yes. The railway company having the funds of the company which are derived from payments made for carriage to fall back upon.

825. (*Mr. Ayrton.*) Is not the property of the shareholders in a railway being spent on the one side just as it is by private individuals on the other, for their advantage, and what is the difference between the two?—In the one case the railway company has been established by law, and they have a monopoly, while the means and power of the private individual are only the result of his own exertions. The public has no choice as to how they will send their goods; they must send them by the railway or not at all.

826. Is it not the same thing with a number of shareholders? They tax themselves to meet the expenses of coming to Parliament, and a large number of the inhabitants of a town tax themselves by their municipal body to come to Parliament with an opposite view. Does not each party meet the expense out of its own private means?—It does; but I say that the public have no alternative but to send their goods by a particular railway.

827. Is there any difference between the shareholders of a company contributing a part of their dividend for the purpose of going to Parliament on the one side, and the occupants or owners of property at Gloucester contributing their funds on the other to oppose the application to Parliament? Cannot they oppose a Bill in Parliament, and, through their municipal body, levy a rate upon the inhabitants to meet the expense?—Would the municipal body have power to do that?

828. (*Mr. Roebuck.*) In the case of a railway company, is there not a large purse in the hands of a small number of persons?—Yes.

829. Whereas, in the case of a municipal body, there is no purse at all, but a very large number of persons to manage the matter?—Yes. I was not aware that there was a power in a corporation to levy rates for such a purpose.

830. (*Mr. Ayrton.*) Do you know that the City of London, by appearing in opposition, has very often exacted from railway companies very large concessions, which it would have been very difficult to justify?—Yes; but the Corporation of London has very different powers, if I am not mistaken, from those of ordinary corporations.

831. (*Mr. Roebuck.*) Does not a corporation come under the description which I gave as to a large purse being in the hands of a small number of persons?—Yes; decidedly.

832. (*Chairman.*) On the other hand, when local parties, for their own interests, wish to promote the making of a line which is opposed by one of the large railway companies, do they not find great difficulty in doing so?—I believe it was in the year 1848 that a railway was first proposed from Birmingham to Stourbridge. There is a railway being made now, but it is not completed; the Act was only recently obtained; as it was opposed by the London and North-western Company, and, at the same time, by the Great Western Company also.

833. So that it has taken 17 years to get that railway made?—Yes.

834. And that delay has been occasioned by the persistent opposition of those great railway companies?—Yes.

835. Are you able to state how many times that project came before Parliament?—I cannot at the moment state, but I remember hearing the particulars of the application made in 1848. The number of times that applications have been made since I cannot state distinctly.

836. Is the line to which you have referred being made by an independent company?—Yes. They first obtained an Act of Parliament for half of it as a mineral railway; then there was an extension of it; and they are working it by an arrangement with the Great Western Company now.

837. So that eventually it has been taken up by one of the parties who opposed it?—Yes. They first obtained an Act for half of it as a mineral railway.

838. Would they ever have succeeded if they had not been taken by the hand by the Great Western Company?—I should say that they were first taken by the hand by the West Midland Company, and I think that they would hardly have succeeded unless they had been so taken by the hand.

839. What are the remedies which you would propose, in order to meet the grievances of which you complain?—I think that there ought to be some general law by which a railway company should not have the power to give a preference to one port over another. When a railway company is interested in dock property, it is obviously to their interest to send all the traffic they can to those docks, but which, of course, is to the detriment of those owning property adjoining other docks, and near to or in another port; and I think that there should be some general power to prevent that.

840. Would not your objection also extend to railway companies being the proprietors of steamboats?—Yes, I think so; but perhaps more to docks than to steamboats, as the steamboats are changeable property, whereas when money is once invested in docks the company is always interested in sending business to those docks.

841. Are you aware that Parliament has, in many instances, granted powers to railway companies to own steamers and to run them from certain ports?—Yes.

842. Then suppose that the Midland Company had power to run steamboats from Bristol to Ireland, would not that be a great temptation to them to leave their rates untouched to Bristol, to increase the traffic from Birmingham to Ireland?—Yes?—There is no doubt that it would, and that is one of the things of which we complain. What we fear is, that some arrangement will be made for the Midland Company to take an interest in the proposed new docks at Bristol, and then of course it will be the interest of the directors to send all the trade they can to that port.

843. (*Mr. Horsfall.*) Which would not be just to other ports?—Certainly not, nor to those who had invested their property in their own ports, because of their being nearer to the consumers' market.

844. (*Chairman.*) I think you have stated that you have large warehouses in Gloucester. Can you give the Commission any information as to the through rates for grain from Gloucester to Ireland?—I do not think that there are any through rates from Gloucester to Ireland; though the Staffordshire and Worcester Canal Company have had recently steamers to Ireland, I am not aware that they have any through rates. I think that it would be charged for separately.

845. With respect to the rates, how do you propose that they should be regulated? Would you give the power of regulating them to a superintending authority in some department of the Government?—I think that there should be some body representing the public; for I think that if Parliament grants to railways a monopoly of the traffic, there should be some party to represent the public.

846. (*Mr. Ayrton.*) What should that party do?—I think there should be some power of appeal against any unfair preference being given to any particular port over another.

847. But how would the party act? What power would you invest him with?—If there was a general law requiring that a railway company should not give a preference to any particular port over another, and that there should be one uniform scale of rates, there would be the power of appealing if there was any infraction of that scale.

848. Do you mean that you would have one uniform maximum rate, or one absolute rate, from which there should be no deviation throughout the country, for the carriage of the same articles conveyed over the same distance?—Perhaps it would be rather difficult, as things are at present, to establish a rate for all railways; but I think that no railway company, over its own line, should be allowed to give a preference to one port over another. It would be, perhaps, very difficult to establish one rate for all companies.

849. You would have, if I understand you rightly, one uniform rate over all the lines of one company?—Yes.

850. Should that be an absolute rate, or only a maximum rate?—If it was only a maximum rate, of course there would be nothing to prevent them from charging a much lower rate, if they pleased, from one particular port.

851. Then you would have an absolute rate above or below which they should never make a charge?—Yes; a uniform rate.

852. A fixed rate that the company should neither increase nor diminish?—Yes; to any one particular place, but that it should be applicable to the whole.

853. (*Mr. Roebuck.*) I understand you to mean that a change made in any part of the line should be a change applicable to every other part of the line?—Yes; if there was no party who complained of that change.

854. (*Mr. Ayrton.*) You would have a uniform mileage rate for the carriage of the same article for the same distance over all parts of the country?—Yes; if no party could show that they were injured by the imposition of it.

855. That is what you would propose to do?—Yes.

856. And you would have a power of appeal to some authority if the railway company deviated from that rate?—Yes; but I think there might be some special cases that might be shown.

857. What discretion would you give to any railway company to deviate from that fixed rate, upon what principle should that be done?—I think that a railway company should not have the power of injuring the public, the public having invested their property in a particular port, by giving a preference to one port over another.

858. If there is to be a fixed rate, there would be no question about any preference, or do you mean that there is to be a fixed rate, with a discretion in somebody to modify it under certain circumstances?—I think that circumstances might arise in which it might be right to modify it.

859. But what would be the circumstances do you suppose that would justify a modification?—I think there might be an arrangement, for instance, as in the case as to Liverpool which I mentioned previously; the expense of the loading of the trucks being taken by the merchant, of course it would not be fair for a railway company to make the same charge in one place where they did not perform that service as in the place where they did load the trucks.

860. I am speaking of a uniform mileage rate along a line of railway, would you allow a railway company to deviate from that fixed mileage rate under any circumstances?—I am not aware at the moment of any circumstances in which it would be justifiable, but I cannot say that there might not be such circumstances.

861. Would you have a uniform terminal charge throughout the country?—As far as I know there might be circumstances that might lessen or increase the cost of terminals to a railway company, and I presume that that is a matter to be determined by the cost; there may be special circumstances.

862. But who should fix the terminal charge; would you invest the same person or persons with authority to do that?—Yes; if there was no reason why it should be greater in one case than in another, I presume that, generally speaking, the terminal charge would be uniform.

863. (*Chairman.*) You propose that fixed equal rates should not be carried beyond the lines belonging to one company?—Yes.

864. How would you get over the difficulty, as between Gloucester and Liverpool, the route from the mining district to which you say the grain is principally carried from Gloucester being in the hands of the Midland Company, while the line to Liverpool is in the hands of the London and North-western Company, so that even supposing your suggestion to be carried out, still it would be possible that there might be different rates as between Gloucester and Liverpool?—You mean that one company would be carrying at a lower rate than the other.

865. Yes, higher or lower as the case might be?—No doubt it would be better to have uniform mileage rates over all railways, but perhaps it would be difficult to carry it out, as things now exist.

866. Would not a uniform mileage rate over all railways be necessary, to secure the object that you have in view?—It would; but then, you see, where there are two railways going to the same place, the competition existing between them ensures to the parties using each of them that they shall have a fair opportunity of carrying on their business.

867. (*Mr. Ayrton.*) Your proposal was that the railway company should not reduce the rates. If I

Mr. C. D. Sturge.
5th April 1865.

understand you rightly, you said that it was to be a fixed rate, therefore competition would have nothing to do with it?—That is to say, a uniform rate over the whole line.

868. I understood you to say that it was to be a fixed uniform rate and not a maximum rate?—I did not mean a fixed rate, I thought you meant that it should be the same for all parts of the line. I think that there should be an uniform rate over a line, and that a railway company should not have the power of charging more over the line per mile in one direction than in another.

869. Are they to have the power of diminishing or increasing the rate at their pleasure throughout the whole line, or is it to be a fixed rate from which they are not to be at liberty to depart?—I think that they should have the power to diminish the rate, for probably, as trade increased, the expense would be less to the company, and it might be to their interest to diminish it.

870. Then you would allow them to diminish the rate if they diminish it uniformly over the whole line?—Yes, and not to give a preference to one port over another.

871. Would you give that discretion to each railway company?—Yes.

872. Then you would have railway companies exercising that discretion and charging different rates, and if so, how would you then have the same rate from place to place for equal distances?—If railway companies charged a different mileage rate, different from each other, of course the charge would be higher on the one company's line than on the other, but still there would be no unfair preference to one port over another for the purpose of promoting the prosperity of the docks in that port in which the railway company was interested.

873. One might then get a preference to another?—It might; but still the company carrying from one dock would not be inclined to place their rates so high that business would be driven to another dock.

874. The distance by one railway differing very much from the direct distance by a different system, if you had an uniform mileage rate, would not that create a difference of charge from place to place?—No doubt it would; but of course there must be some allowance made for that, otherwise the roundabout railway would carry nothing.

875. Would you propose, if the rate is not to be a mileage rate to be measured by the direct distance from place to place, that it should be measured by the shortest route?—Yes. I think there would be hardly any reason why the roundabout railway should have power to carry at a higher rate than the direct one.

876. (*Chairman.*) Take, for example, two railways running from Birmingham to London; if the London and North-western Company was charging the same general mileage rate over the whole of its system as the Great Western Company, both companies being bound to charge the same mileage rate, the practical result would be, would it not, that the Great Western Company would not carry any of the permanent traffic from Birmingham to London?—I believe that there is a special clause in the Great Western Company's Act as to that. They may carry to Birmingham at the same rate as the London and North-western Company, but if they reduce their rates to Birmingham, they must do it over the whole of the line.

877. (*Mr. Ayrton.*) What you propose I think is to have a uniform mileage rate, and to alter the present state of things; but, if so, how would that be applicable to cases where the distance by one railway differed greatly from the direct distance by another?—I suppose that the fairest principle would be a mileage rate by railways, as a rule; but I think there might be exceptional cases, as, for instance, where two companies ran to the same place, one line being longer than the other.

878. Had you applied your mind to the consideration of these questions before you came here?—Yes. I think I had; but I think that there would be some exceptional cases arise under any system that might be adopted.

879. (*Mr. Horsfall.*) Without pretending to reconcile all the anomalies that might arise, you think that your suggestion would be a great improvement upon the present system?—Yes. I think that it would prevent any unfair preference being given to docks in which railway companies may be interested, and which is a great grievance now, for a railway company may obtain an Act giving it power to join other parties in making docks, and it is almost impossible then to prevent them giving a preference to those docks.

880. (*Chairman.*) Is there any other suggestion that you wish to make?—I think not.

The witness withdrew.

Adjourned *sine die*.

Friday, 28th April 1865.

PRESENT:

The Right Hon. Lord Stanley, M.P., F.R.S.
The Hon. E. F. Leveson Gower, M.P.
The Right Hon. Robert Lowe, M.P.
T. B. Horsfall, Esq., M.P.
Robert Dalglish, Esq., M.P.
George Carr Glyn, Esq., M.P.
E. T. Hamilton, Esq.
J. R. McLean, Esq.
W. Pole, F.R.S., *Secretary*.

The Right Hon. LORD STANLEY in the Chair.

Mr. H. J. Atkinson.
28th Apr. 1865.

Mr. Henry John Atkinson (Mayor of Hull) examined.

881. (*Chairman.*) You are, I believe, President of the Hull Chamber of Commerce?—Yes, I am President of the Hull Chamber of Commerce, and also Mayor of the Borough at the present moment, and Chairman of the Parliamentary Committee of the Corporation. In these capacities I was requested to attend before the Commission to give evidence, and the principal point that we wish to put before the Commission is the manner in which we are treated by the North-eastern Railway Company. That company, as the Commission are aware, have all the ports from Berwick to Hull. They have Sunderland, and the Tyne Docks, where they have spent 500,000*l.* in docks, and they are therefore very much interested. They have old Hartlepool, and they have by traffic arrangements West Hartlepool, and they are now before the House of Commons with a Bill to amalgamate the West Hartlepool Company, both the harbour and the railway property, with their own system. They have also Middlesborough and Stockton, so that they have the whole of those ports, and the way in which they work them is to give us what they call equal treatment, and the equal treatment consists in carrying goods to Leeds and other places at the same rate from Hartlepool and from the Tyne Docks as from Hull. I will take Leeds as an example. The distance from Hull to Leeds is 50 miles; the distance from Hartlepool to Leeds is

72 miles; there is a difference of 22 miles further to carry the goods from Hartlepool to Leeds, yet they charge exactly the same rate per ton. From the Tyne Dock the distance is still further, 104 miles, making a difference as against Hull of 54 miles, in fact, more than doubling the mileage that the goods are carried, and the rate is still the same as from Hull.

882. As I understand you, your complaint is that they deprive you of the natural advantage which Hull possesses from being near those great inland towns?—Yes, that is our grievance; that the advantage of our geographical position is taken from us, and the great disadvantage of that is, that the north country ports have advantages of their own by being near the coals, and consequently the sea freight from the Baltic and other ports to their ports is less than it is to Hull. The consequence is that our Hull merchants are driven by this system of the North-eastern Railway Company to import a great quantity of goods that they have bought for the Hull market and intended to bring to Hull, and to send them down to Hartlepool, although in many cases they have no establishments there. With regard to the sea freight, I can give instances, as a shipowner and agent, in which there is a difference of 7*s.* 6*d.* per standard hundred of deals upon 45*s.*, that is, about 16⅔ per cent. difference in favour of Hartlepool upon the sea freight, and about five per cent. upon the value of the goods that are thus imported, which is in itself a profit. We have appealed again and again to the North-eastern Railway Company for satisfaction, and for some better treatment; and we have several times been before the House of Commons and the House of Lords. In one instance, about two or three years ago, the House of Lords turned out a Bill of the North-eastern Company upon this very evidence which we gave them. I think that about 100,000*l.* were spent by three companies and nothing was done in that session in consequence of this grievance of ours; and this session, before the North-eastern and West Hartlepool Amalgamation Bill was introduced, a deputation representing all the trading bodies of Hull waited upon the North-eastern Company again, and we saw the chairman. I was there as spokesman, being Mayor of Hull and President of the Chamber of Commerce; and the Steamship Owners' Association was represented also. The chairman of the North-eastern Company said that that was their fixed policy, and that it must continue to be so, as they had given some implied pledge when one of the northern lines was amalgamated with them that they would treat all parties alike; and he calls it treating them alike, carrying at the same rate per ton, instead of per ton per mile. Therefore the traders of Hull are intensely interested upon the point, and they did their part towards applying to Parliament and the Government again and again upon the subject; and they thought it was very desirable indeed that evidence should be given from Hull, and accordingly I am here to give it. The vice-president of the Chamber of Commerce, who is a timber merchant in a very extensive way of business, and does some business at Hartlepool by compulsion in this way, is also here, and he will, if necessary, put in some tabulated statements which will save the necessity for my going into the distinct rates as to many towns which I should otherwise have to do.

883. How long has this been the practice of the North-eastern Company?—It has been the practice of the North-eastern Company, I believe, since about 1854, when this amalgamation of which I have spoken took place. Prior to that, when the Hull and Selby line was amalgamated with their system, that is, the York and North Midland, as it was then called, a similar pledge to that which they rely upon for carrying on their present system was given to us. The people of Hull were very anxious about preserving what they called their birthright and the independence of the line, and great excitement took place as to its being merged into the system. The chairman of the York and North Midland Company declared, "Our "great object will be to render the port of Hull free "of access from all quarters of the kingdom, and that, "too, upon the most liberal and advantageous terms "possible; and if it comes to be a struggle between "Hull and any rival port, then this company will be "prepared to carry traffic to Hull at as low or lower "rates than any other company in England." We rely upon that as being a similar pledge to what they rely upon. This pledge they gave some nine years earlier; and although I read that to Mr. Thompson, the chairman, two or three months ago, it did not produce the desired effect.

884. (*Mr. Glyn.*) Did the York and North Midland Railway occupy the same district that the North-eastern Railway does?—Yes; the one that was merged into the North-eastern.

885. The York and North Midland Railway did not go to Newcastle?—No; but every station that the York and North Midland Company had is now the station of the North-eastern Company; they have it altogether now.

886. But the North-eastern district comprehends a much larger district, does it not?—Yes; a much larger district.

887. (*Mr. Horsfall.*) Before this amalgamation took place you had the advantage of competition, had you not?—I am not sure; but they were different companies then.

888. (*Chairman.*) The North-eastern Company act upon the principle acted upon in the Post Office; it charges equally for carriage whatever the distance is?—It seems to be something of that kind in some cases, but is not carried out.

889. Have you reason to think that they apply that rule generally, or is it exceptional and confined to the case of Hull?—They do not apply it generally. In some cases they depart from that principle when it suits them to do so; they do not seem to go upon the system any further than as it may suit their interests.

890. As I understand you, they have an interest in those other ports, and what they say to you is this: We will not place you at a positive disadvantage as compared with those ports, but we will place them upon an equality with you notwithstanding the greater distance?—Yes, that is what they say; and their interest in one port especially is doubled, having spent 500,000*l.* upon the Tyne Docks. If vessels go there instead of to Hull, they get not only the dock dues, but also the rates of carriage and the labour; whereas in Hull there are two companies, the North-eastern Company for the railway and the Hull Dock Company for the dock dues; they have an extra interest to that extent.

891. What other railway companies have access to Hull besides the North-eastern Company?—We have the Manchester, Sheffield, and Lincolnshire Company, but on the other side of the water; the station is at New Holland; but the fear is that the North-eastern Company have made the same traffic arrangements with them for the purpose of preventing a competing route even for the Manchester traffic. They have what they call the Humber agreement, which gives the Manchester, Sheffield, and Lincolnshire a certain amount of the profit of the traffic whether they carry it or not, and consequently they do not carry it. They did carry, I think, about a sixth, and they were paid about a third of the profit; that was the last agreement. They do not compete under such circumstances; they know that they will have their agreed share of it.

892. (*Mr. Glyn.*) Is that the only company there?—Yes, that is the only one; we have only one railway into Hull, viz., the North-eastern.

893. Do not the Lancashire and Yorkshire Company work over the North-eastern Railway?—They work in connexion with them; they are parties to the Humber agreement, and they get their share of the traffic; they do not come in. They brought in a Bill three years ago to make a line into Hull, but the North-eastern Company defeated them in the Commons, and made an arrangement afterwards.

Mr. H. J. Atkinson.

28th Apr. 1865.

894. (*Mr. Horsfall.*) You consider that the preference given to Hartlepool by the railway company is owing to the interest which the railway company has in the docks at Hartlepool?—I should say that it is partly so at the Tyne, and will be so at Hartlepool, but I think that their mode of arguing is this, that as long as the traffic comes upon their system at all, being in possession of all the ports, they will be satisfied; I believe that that is the consideration that weighs with them, besides which they get a longer mileage out of the through rates for goods taken north.

895. (*Mr. Hamilton.*) Do the charges per ton include terminal charges?—Yes; they include the terminal rates. The Board of Trade report of this year expressly notices the point of the natural flow of traffic, and gives an opportunity to appear before any Committee where an Amalgamation Bill is brought forward, consequently we are all appearing or shall appear next week before a Committee of the House of Commons upon this very Hartlepool Bill. But I wish to mention to the Commission that it is very hard upon us as the corporation of the town, as private traders, and as a chamber of commerce without funds, to have to come up year after year upon this point and oppose a wealthy company who can spend 75,000*l.*, and simply pay to their shareholders 5*s.* per cent. dividend less in a year, while on the other hand we have to collect the money from door to door to meet these expenses.

896. (*Chairman.*) What is the practice that you complain of? Do you say that your own charges by this line are too high, or that the charges to the rival ports are unduly reduced?—We complain that we are put upon an inequality with them; we do not say that the charges are too high, but we take this view of it, that we are put upon an inequality, and we therefore think that Parliament ought to give us redress.

897. But inequality may be produced in two ways, either by making your charges high, or making the other charges low. Assuming that your charges are only the ordinary market rates for carriage of goods for the distance represented, do you consider that you have a right to complain of a railway company if it thinks fit to incur a loss by running traffic at a lower rate in another direction?—Yes; when it drags trade from us which legitimately belongs to us. If the rate was fair, as you have put it, that we pay, it must be unfair for another port competing for the same class of business, in fact getting away some of our business at double the distance, to have the goods carried for the same rate, that cannot be fair. If our rate is too high, let it be reduced; but if our rate is the proper one, let the other ports pay something more.

898. (*Mr. Glyn.*) You object, as I understand you to being charged a penny when the other ports are charged only a halfpenny?—Yes.

899. (*Mr. Hamilton*) What you want is a uniform mileage rate?—Upon their system I should say that it must be a fair thing, and I think I might go further than that; but I ought to say that the mercantile community are rather divided upon it; they all agree that the rate ought to be a uniform one so far as this one system is concerned when it is the like sort of traffic to each place; but the other point we did not come to any determination upon, as we did not consider it before us.

900. What other point do you refer to?—As to whether that system should be carried out throughout the country.

901. I meant throughout the North-eastern system?—We think that throughout the North-eastern system it would be fair.

902. (*Chairman.*) When you speak of a uniform mileage rate, do you put out of consideration the question whether one line or part of a line has cost much more than another?—No, we look at it as one system, and I give my opinion here as the opinion of the people of Hull as to this system. We say that the whole cost would be so much, and that would amount, of course, to so much per mile.

903. Take, for example, two lines of railway belonging to the same company, each line being 50 miles in length, but one of them passing through a very difficult country with frequent tunnels, in cuttings, or on embankments, while the other line passes along a dead flat, and has cost as little as a line could cost for engineering works, would it be fair, in your opinion, that an equal mileage rate should be charged in each of those cases?—Taking it as one system, it would be fair, taking the cost of the railway right through. They would reduce the average cost per mile by throwing together the difficult and easy parts, and saying that the whole of the railway averaged in cost so much per mile.

904. Although the railway system might have been extended from one end of England to the other?—Yes, I should consider that fair.

905. (*Mr. Hamilton.*) Were there any greater facilities for construction in one part of the line than in the other; for example, between Hull and Leeds, as compared with the country between Hartlepool and Leeds?—I think it would have been much the same thing; any difference would be in favour of Hull.

906. (*Mr. Horsfall.*) You contend, in point of fact, that Parliament having given a monopoly of route to certain railway companies, it is the duty of Parliament to see that those railway companies make equitable charges, not only to individuals, but in the different localities?—Yes.

907. (*Mr. Glyn.*) Can you state what the charges are between Hull and Leeds, taking any place short of Leeds, or does the same system of charges with reference to the three ports you have mentioned apply to any other place besides Leeds?—Short of Leeds there are variations in the charges; but to Leeds and the manufacturing places this system applies, where the great traffic is done. Short of Leeds, where the traffic is small, and not of the same importance, the rates vary.

908. Otherwise the charge is a common one as you have described?—Yes, in the cases I have mentioned it is not the same rate for each.

909. It would be a higher rate of course?—Yes.

910. To any point to which the distance was shorter?—Yes; that is the case in some instances. We also have to complain that the railway company are quite irresponsible, so far as bringing our demands to bear upon them goes. We cannot bring them to bear at all. They treat our representations with what amounts to contempt, and we think that if some system of audit or overlooking of their accounts and transactions was adopted, the trade of the country might be protected in a much better way than it is at the present time.

911. (*Chairman.*) Beyond the establishment of a uniform mileage rate by the company with which you are more immediately concerned, have you any other suggestion to offer to the Commissioners?—No other; I think that that would be a solution of the difficulty.

912. (*Mr. Horsfall.*) What would be the controlling power that you would suggest should be placed over railway companies?—I feel that it would be almost presumptuous in me to suggest anything to such a body as this Commission, but I should have thought that some department in the Board of Trade, or some other department might be created that would be able to make the railway companies more responsible than they are at the present moment, for they do just as they like now.

913. (*Mr. Hamilton.*) To whom do you think they ought to be made responsible?—To the public and to the Government.

914. (*Mr. Horsfall.*) You think it is desirable that there should be some court of appeal?—Yes.

915. (*Mr. Glyn.*) They are governed by their maximum toll, are they not?—No doubt; but they do many things which they would not dare to do if there was any proper system of check exercised over them; I am certain of that; whether they ever exceed the maximum I should doubt.

916. (*Mr. Hamilton.*) You say that they do many things, can you give any instances?—They make exceptional arrangements with individuals sometimes for a similar sort of traffic; and the greatest grievance is this, that they carry goods double the distance for the same rate.

917. (*Mr. Glyn.*) Can you give any instance of such an arrangement having been made with individuals?—I have heard of such, and I know that such have existed, but the cases have not come within my own knowledge, because I am engaged in business as a shipowner and agent; I am not so much concerned with goods, and therefore I should prefer not going into a matter that I could not follow out into all its details.

918. (*Mr. Gower.*) I did not quite understand an answer that you gave before. Apart from possessing docks in those northern ports, has the railway company any interest in carrying goods for 83 miles for the same charge as they make for carrying goods 55 miles?—Yes, they had a little interest further, so far as the Humber agreement is concerned. Three years ago, I think, when we were before Parliament upon this same subject, Mr. Hawkshaw, who was present as the representative of the Lancashire and Yorkshire Railway Company, brought that out in his cross-examination, that is, that if goods were carried to Hartlepool from a given point, the Lancashire and Yorkshire Company did not participate under the Humber agreement, but if they came to Hull they did participate. If even this is altered, still the Company would get more mileage out of the gross rate by the goods going the longest distance. That would be a direct advantage to the North-eastern Company, in addition to any advantage they might get from the labour and dock dues.

919. You are opposed to railway companies making those arrangements which are most profitable to themselves?—No; I am not at all opposed to that; I am quite ready to allow them to carry on their business as I would carry on my own; but if I tried to do an injustice to any one I think I ought to be checked. What I desire is, that they should not do an injustice to one port, because it pays them better to drag away the trade to another. They enjoy a monopoly, and therefore I think that they ought to be held responsible to treat all the ports alike.

920. When you state that they have a monopoly, it is open, is it not, to any set of capitalists to propose any new scheme from Hull?—Yes, and they have tried that, but we have to strive against a company which possesses a capital of 30,000,000*l.*, and supposing that they pay a dividend of 5 per cent. per annum, and they pay their shareholders only $4\frac{3}{4}$ per cent. for one year, there will be 75,000*l.*, with which they may crush any number of men who attempt to oppose them. We could not in a place like Hull, with 117,000 inhabitants, find persons who would put down the money to enable us to contend against the North-eastern Company with their 30,000,000*l.* of capital.

921. When you say that you have tried it, has any scheme been started?—Yes; a scheme was lodged about three years ago, and there was a contractor in London who was ready to find the greater part of the capital. The Parliamentary Committee of the corporation at that time approved of the scheme and decided in favour of it, considering that it would be a great advantage to us if we could get an independent line, and so hold the system of which we complain in check, but we could not get the public generally to come forward with their money, and the scheme fell through, to a great extent for want of public spirit.

922. I suppose on account of its being considered that such an additional line would not be profitable?—No; I think it fell through from want of public spirit, and also because the North-eastern Company, having held their position so long, naturally exercised a very great influence over many persons with whom they did business, and some of them were probably afraid to stand out prominently against the company, and for one reason and another the thing was stifled. It was before the public for about three months, and 2,000*l.* or 3,000*l.* was spent upon it; the line was surveyed, and plans deposited, and so on.

923. (*Mr. Hamilton.*) To what part of the North-eastern system does the Humber agreement apply?—It applies to the traffic from Liverpool and Manchester, Ashton and Staleybridge.

924. Can you state shortly the terms of that Humber agreement?—The terms of it are that certain companies shall divide the profit made upon the traffic however it is carried, and, as I stated before, in consequence of that, the Manchester, Sheffield, and Lincolnshire Company, although they carry but a small proportion of it, get paid for a larger proportion.

925. The effect of which has been, I suppose, to do away with competition?—Yes, that was the aim of it and the result of it.

926. (*Mr. Glyn.*) Did you say, when you alluded to the Humber agreement, that the Lancashire and Yorkshire Company did not participate in any profit upon the traffic going to Hartlepool?—Yes, they lost that formerly. Now they lose the difference caused by the increased proportion of North-eastern mileage.

927. And therefore they have an interest in carrying all their traffic to Hull?—Yes, that was the evidence given by Mr. Hawkshaw.

928. (*Mr. Horsfall.*) You are aware, I presume, that a private individual can run private carriages and trucks upon a railway?—Yes, but that is not a thing that is much done so far as we are concerned.

929. But a private individual has a right to do so by law?—Yes, but it is inoperative.

930. Is that owing to the high tolls which are charged?—Yes, and from having to provide carriages, and the difficulties that would be thrown in their way; I should think in a flush of trade that they would be left behind occasionally, and no man would like to risk it; I have not known it tried within my knowledge.

931. The right to do so, however, shows the intention of Parliament that there should be competition?—Yes, I think so.

932. (*Chairman.*) In practice it is found, is it not, that the use of the road, and the property in the road, are most conveniently vested in the same hands?—Yes; I should say so, decidedly.

933. With the great increase of traffic that there is, and the great frequency of trains running upon a line, you would probably think that it could not well be otherwise?—I do not think that it could be safely altered.

934. (*Mr. Hamilton.*) Where does the Lancashire and Yorkshire system run into the North-eastern system?—At Normanton.

935. (*Chairman.*) You have spoken of exceptional arrangements being made with individuals, do you mean arrangements to carry goods sent in large quantities by some person at a lower rate than the usual one?—Yes, at a much lower rate, I have heard in some cases.

936. Is not that a common practice upon all railways?—I think it is done, but I do not think it is commonly understood that it should be done.

937. Is it not simply done upon the principle which makes wholesale purchases cheaper than retail purchases?—I do not think that the public understood it in that way.

938. You think that it is a matter of individual preference and favour?—Yes, and also the keenness of the persons who get the advantage by going a step further than those people would who fancy that railways are a sort of public institution, and that the prices which are issued by railway companies are prices which will not be departed from.

939. (*Mr. Glyn.*) Quantity is generally the governing element, is it not?—Yes; I think so.

940. And in the case that you have put, the quantity must be a large one?—Yes.

941. (*Mr. Horsfall.*) If a person offered you a freight of 300 tons, would you not, as a shipowner, take it at a lower freight than you would four or five or six tons?—I do not think that that is a parallel

Mr. H. J. Atkinson.

28th Apr. 1865.

case. As a shipowner, if I had my ship on the berth for any particular place, and a man came and made it worth my while, and gave me half a cargo instead of five or six tons, that would make me ready the sooner to sail, and therefore I should get value received. In the other case the trains are constantly going, and therefore there is no consideration of that sort, they have only to put another carriage or two on.

942. Suppose that a party lives at an intermediate station, a small one, and he can give the company a truck full of goods, that truck will be sent directly and immediately from that particular station?—Yes.

943. If, on the other hand, he can only send a few packages, those few packages will be transferred from one truck to another at the different stations?—They have what they call pick-up trains, which pick up and put down those small affairs as they occur—once or twice a day—or once, for those bye-stations; and, therefore, any small parcels of that sort would go by the pick-up train. Some particular trains stop at every station, while other trains run through. In the case that you put of the shipowner, he has no monopoly, but he goes into the market and takes whatever the public will bargain to give him; in the other case the railway company have it all to themselves, and I think, therefore, that they ought to be more strictly controlled.

944. (*Mr. Gower.*) Are you of opinion that the directors and managers, by allowing of these exceptional arrangements, deprive the shareholders of their just profits?—I think that the shareholders get their just profits generally.

945. Supposing that in certain cases they allow individuals to send goods for a smaller charge than they need do, the shareholders then would be by so much the sufferers, would they not?—Yes. I believe that in some cases they do work for less than they ought to do.

946. (*Chairman.*) You have spoken very strongly in favour of a uniform mileage rate, would you go so far as to say that where it is an object to create and develop new traffic, which is only just beginning, you would not allow a railway company to carry goods at a lower rate than their ordinary rate.?—That depends upon what would be called developing traffic; for instance, some managers consider that it is developing traffic to drag traffic from another line to their line to run by another route, that is, on their line, but that does not increase the traffic at all. On the North-eastern system, the same quantity of stuff would be landed at Hull, and go along the railway from Hull to Leeds; the only difference is, that it is landed at the port of Hartlepool, and goes from Hartlepool to Leeds; and then you will see a paragraph saying how immensely the trade of Hartlepool has increased, and that is done by the Hull merchants often, and to their cost in hundreds of cases. My firm have chartered ships with Hull merchants for cargoes that they have tried week after week to get tonnage for to Hull, and which they intended to bring to Hull, and yet solely on account of this system pursued by the railway company, they have had at last to allow those cargoes to be diverted to Hartlepool.

947. (*Mr. Glyn.*) Is there not a large export trade in coals from Hartlepool?—Yes, there is a large coal trade there, and that is their advantage.

948. (*Mr. Hamilton.*) Between which places is there the largest trade, between Hull and Leeds or between Hartlepool and Leeds?—Between Hull and Leeds.

949. Very considerably greater?—I should think it is; but not having seen the accounts of the railway companies, I cannot speak positively as to the number of tons going from each of those places, but I think it is so even yet.

950. If the trade is larger, that would be a reason, would it not, why there should not be higher rates between Hull and Leeds as compared with Hartlepool and Leeds?—We ask for higher rates between Hartlepool and Leeds, because between Hull and Leeds the distance is the shortest.

951. (*Mr. Horsfall.*) Your complaint is not so much as to the charges where there is a difference in the quantity of goods carried, 100 tons in one case and five tons in another, but that the railway companies charge the same rate for carrying 100 tons of goods, say, 50 miles, as for carrying them 100 miles?—Yes, that is my complaint. I have not made any complaint upon the other point at all. What we ask for is, to have like treatment under like circumstances, that is what we want.

952. (*Mr. Dalglish.*) Is there any difference of opinion as to the facts between the shipowners at Hull and the shipowners at Hartlepool?—I think that the Hartlepool people would say, "Let us con-"tinue to have this great advantage that we now "have."

953. Does it not give the shippers of goods from Leeds also the advantage of competition?—Yes, it gives them the advantage of sending twice the distance, if they like, for the same rate.

954. It gives them the advantage of competition as between shipping at Hartlepool and shipping at Hull?—In many instances the shipping has to change from Hull and go to the northern ports.

955. But take this fact, the railway company charging only the same price to Hartlepool, a distance of only 72 miles, and to Hull, a distance of 50 miles, does not that give the shippers of goods the advantage of competition?—Yes; certainly, it gives them two or three ports to choose from, but that is greatly to the injustice of those ports which are nearer to them.

956. You mean that it is unjust to Hull because it brings Hartlepool into competition with Hull with regard to shipping?—Yes; it brings it unfairly into competition with Hull; that is our case.

957. Do the people of Hull complain that it has an injurious effect upon them; does it touch them?—Yes; in cases where the Hull merchants, who intend to import into Hull, are compelled by this pressure of circumstances to send their vessels to the north, the result is that the Hull people never see the ships at all, although it is Hull business, and done by Hull merchants. The ships go into Hartlepool and discharge there, and all the money is spent there for labour, and their bakers' bills, and butchers' bills, and ropemakers' bills; all that money is spent in Hartlepool and not at Hull.

958. I meant to exclude the shipping interest altogether, and to ask you whether this diversion of the trade has any effect upon the population of Hull not connected with the shipping?—It has the greatest effect upon them, because we consider ourselves a port of transit, and dependent almost entirely upon our business in that way, and therefore it attacks us in the most vital part; but I can answer your question in a practical way, probably, by just mentioning another circumstance; and that is, that the Guardian Society, the merchants' and traders' association—which is like a chamber of commerce so far as the shopkeepers are concerned—consists of 750 persons, and they have petitioned against the company again and again. They are petitioners this year, and they are contributing as well as they can for the express purpose of having this injustice remedied, for they all feel it from one end of the town to the other; the owners of property, of houses, and shopkeepers, and any one who has any property in Hull.

959. Would the population of Hull be benefited to any material extent, provided the railway traffic was so arranged that the articles of sugar and tea were carried at mileage rates in the proportion of 50 to 72?—I do not think that that case would arise. The amount calculated upon sugar and tea would be so infinitesimally small that I do not think there would be any difference at all.

960. The principal complaint from Hull appears to be that the state of things which you have described interferes with the shipping interest?—No, not that; it interferes with the interests of every inhabitant of Hull. There are very few people in Hull who are

not thoroughly immersed in business, and therefore I may say that every one in Hull is interested, because they all feel it; the Chamber of Commerce, the Steamship Association, the Guardian Society, and the Corporation. If you were to call a town's meeting, I do not think you would find three or four people who were not enthusiastic in favour of getting what they think is justice to Hull.

961. (*Mr. Horsfall.*) The labouring population of Hull being chiefly employed in the shipping, whatever affects the shipping interests must affect the working classes?—Yes, throughout.

962. (*Mr. Glyn.*) Are the dock dues at Hull high or low?—They were high, but they have been somewhat reduced.

963. Was that in consequence of the competition by the other ports?—Partly. It was not in consequence of this railway system, but it was in consequence of a movement that we made in Hull. We all subscribed, and tried to get up an opposition dock company at Hull.

964. Still I suppose the dock dues are considerably higher than in the other northern ports to which you have alluded?—Yes, they are higher, but not so much so as they were.

965. (*Chairman.*) There is another matter, I understand, to which you wish to call the attention of the Commissioners; namely, the running of steamboats by railway companies?—Yes, that is another point. The circular which has been issued asks whether any means can be suggested for the purpose of lessening the cost of land traffic. We think that the cost of land traffic could be lessened, if the railway companies were kept to their own business, and were not allowed to interfere with the sea carriage; and we think that that is borne out by experience, for all that we have seen do so fail. I believe that the last powers that were given were given to the directors of the Eastern Counties Railway to run steamers from Harwich to Rotterdam, &c., and their reports since that time have shown that they have lost money by carrying on that traffic. Then again, the Hartlepool Company lost greatly by irregularly dabbling in steamboats and collieries, and so on. Then again, in the case of the South Yorkshire Company. I heard one of their representatives cross-examined about two years ago in Parliament, and he admitted to a Committee in the House of Commons, that without any parliamentary powers they had lost 20,000*l.* in subsidizing a steamboat line, and he justified it by saying that traffic had by that means been brought upon their line, which would have gone some other way. But we say that that 20,000*l.* so lost was a dead loss; it might not be a dead loss to the shareholders of the South Yorkshire Company, because they got the same traffic upon their line, which would have gone over the line of some opposition railway company; but we say that if that 20,000*l.* had not been spent in that way, the railway carriage by land, which we consider is the legitimate trade of railway companies, would have been carried on at so much less than it was carried on. Again, the Manchester, Sheffield, and Lincolnshire Railway Company have obtained powers to run steamboats, they have not bought any steamboats, and therefore we cannot refer to any loss on that score, but we can refer to the fact of their having spent a million of money unprofitably in the docks.

966. (*Mr. Glyn.*) You mean to run steamers from Grimsby to places on the Continent?—Yes, and in the Baltic too. The money expended has been very unproductive, and it only enables them to drag away business from Hull by sundry arrangements of theirs, which they have made, such as sometimes giving up their dock dues; and the same system will no doubt be carried on when the railway companies, if they are allowed to do so, engage in water traffic. They have plenty of opportunities of disguising the losses upon the steamboats by charging one through rate, which includes both the land and the sea rate, and by having such large capitals that they can run the private shipowners off the lines altogether.

967. Has the company which you have mentioned obtained Parliamentary powers?—Yes, the Manchester, Sheffield, and Lincolnshire Company have.

968. But they have not exercised them?—No.

969. (*Chairman.*) I believe you appeared before a Committee in the House of Commons last year, or the year before?—Yes, I did; I may state that it requires a special knowledge of shipowning before parties engage in that business. I do not think there is anything more dangerous for any one without experience to touch than shipowning, and we do not very soon thoroughly attain the necessary knowledge. I have seen many instances of men who have made more money than they could well use in their own business, and they have become shipowners, and I have seen the most disastrous results follow. I consider that it is like playing with edged tools when railway companies touch these things, for they generally lose by it; and I feel certain that it will always be attended with loss.

970. (*Mr. Horsfall.*) When the railway companies lose, do not the public gain?—I think not; I think that there has been no want of that private enterprise which will supply everything that is wanted in the way of shipping, and if railway companies will only make out a clear case, and say: Here is this traffic, and we shall be glad if you will give us some steamers to carry it, they will always find people ready to supply the public with all the necessary facilities, because it pays them to do so; I consider that it does not pay to let anybody lose money that can be avoided. I do not see why they should lose money. I believe that they are greatly fleeced.

971. (*Mr. Hamilton.*) If the experience of railway companies has been what you represent it, it might naturally be supposed that they would very soon cease to meddle with steamboats?—But they seem to be inclined to carry it on. They think that it helps them to drag traffic away from the lines of rival companies, and they consider it a great success if they get the traffic on to their lines.

972. (*Chairman.*) Your complaint, as I understand it, is that the public get the conveyance below cost price?—No; my complaint is that money is wasted by allowing railway companies to dabble in sea conveyance, whereas they ought to be confined to their own legitimate functions, that is my complaint; and I rest that upon the circular which has been issued. I think that the Royal Commission would save money and cause the land carriage to be done cheaper to the public if they would prevent railway companies travelling out of their own vocation.

973. Do you see any great incompatibility between carrying passengers and goods by land and carrying them by sea?—Yes; I think the latter is quite another thing, and that it requires a different sort of management in every way.

974. Take the case of a company in England working in connexion with a company on the Continent with a comparatively narrow channel between, do you see no advantage in having both the railway and the steamer in one hand?—When you come to that which I should define as a mere ferry passage, of course that is a different thing from what I was referring to; for instance, seven hours on land, and then immediately afterwards perhaps, seven days on the water, which railway companies are getting leave now to do.

975. (*Mr. Hamilton.*) I thought the objection to giving railway companies power to become the owners of steamboats was, that it was injurious to the public by increasing the rates?—It increases the rates in this way, that if you waste money, that money must be repaid in some way or another.

976. Surely it is not in the province of Parliament to teach people how to make prudent investments?—I think that in important interests, like railway interests, if you see that they are not only going wrong, but they are doing that which it does not belong to them to do, it is not beyond the power of Parliament to stop them.

977. Not if the public is injured, but you say that

Mr. H. J. Atkinson.
28th Apr. 1865.

the shareholders are injured?—Yes; but I consider that the public will be injured, and that the natural ultimate result of it will be to drive private enterprise out of the field, and to allow the railway companies to repay themselves if they can hold on long enough.

978. (*Mr. Gower.*) Do you not think that the railway companies themselves are the best judges whether running steamers is profitable or not?—No, because I consider that they judge upon fallacious grounds, viz., that if they get, I will say, 25,000 or 50,000 tons on to their line which would have gone by another line, it increases their trade. I say that that traffic would have gone by the other line, and that it does not increase the trade of the country. I therefore think that it is a disadvantage.

979. (*Chairman.*) I believe that you laid the whole case before a Committee of the House of Commons last year?—Yes.

980. And your object was to obtain what you are now seeking, a prohibition to railway companies from connecting themselves with steamships?—Yes.

981. The decision of the Committee, I believe, was adverse to that?—I rather think it did not come to that, but I think it was debated in the House afterwards, and nothing was decided upon it. I think it was left to the individual Committees to decide in every case. It was considered that it should not be decided upon the principle I have mentioned.

982. Did it not stand in this way, that it was left ultimately to the decision of the House as before, and to each Committee to settle, you having desired that the Committee should be prohibited from granting those powers?—Yes; that was our object.

983. Is there any other matter that you wish to lay before the Commission?—No.

The witness withdrew.

Mr. S. West.

Mr. Stephen West examined.

984. (*Chairman.*) You are Vice-President of the Chamber of Commerce at Hull?—Yes.

985. You are also, I believe, a timber merchant?—Yes.

986. Mr. Atkinson, the Mayor of Hull, has just given us evidence as to the complaints which are made in Hull of the charges made by the North-eastern Company, and we understand it is alleged that preference is given to Hartlepool and other ports to the disadvantage of Hull. Have you any statement to make in support of that complaint?—Yes. The distance from Hartlepool to places in the West Riding of Yorkshire and Lancashire, and also to the Midland counties, is about 36 miles greater than from Hull. Those are the districts upon which our trade chiefly depends, and we complain that the distance being so much greater, the railway companies carry the goods at the same rate per ton. The evil is felt the more, inasmuch as Hartlepool, from its local position, possesses an advantage over Hull in respect of its over-sea freight, the freight to Hartlepool being considerably less than it is to Hull, owing to its local position and its command of the coal trade, and in addition has lower port charges. These circumstances create a difference of from 15 to 20 per cent. in the freight as against Hull, and the consequence is, that the advantage which Hull possesses in its local position, from its greater contiguity to the districts of the West Riding of Yorkshire and Lancashire, and all places south of the Humber, is neutralized; and we are deprived of the means that we should otherwise have of competing against the advantages with which Hartlepool commences. Had the case been the reverse, and had Hartlepool suffered under the disadvantage of a high over-sea freight, no complaint, perhaps, might have originated, because that which we gain on the one side might be neutralized on the other by the cheaper sea freight, and if it was as little as the inland freight, it would not be of much consequence; but the North-eastern Company, as we conceive, act very unfairly towards us, as Hartlepool, having the advantage which I have mentioned, to begin with, adds to that the advantage of having its goods taken a greater distance for the same money. The effect of that has been, speaking now of the timber merchants, that we have been compelled, in self-defence, to transfer a very large portion of our trade, that we wished to continue at Hull, to Hartlepool, and some of the Hull timber merchants have already got regular establishments there in consequence of this arrangement, and they are doing pretty nearly one-half of their business at Hartlepool, although they are Hull merchants. The grievance, therefore, is rendered very palpable by the circumstance, that these are not merchants who have sprung up in Hartlepool in a spirit of fair competition, but the inequality of the charges has so completely turned the scale against Hull, that the Hull merchants have in self-defence been obliged to transfer their business, to a certain extent, to Hartlepool. We have sent many cargoes into Hartlepool, and that, of course, deprives Hull of the advantages which it should possess. Hull is situated so advantageously for the north of Europe trade, that we do not fear any competition in that trade if we were fairly dealt with in respect of our internal communications. Hull has risen entirely from its peculiar situation, and the local facilities which it affords for the north of Europe trade, having also a large command of river and canal communications, but that is now to a great extent neutralized. Hartlepool has sprung up, a port which was never heard of until about a dozen years ago, and it has since that time taken the trade out of our hands; but this we should not complain of if it were owing entirely to the natural advantage which Hartlepool possessed; it is only so in respect to the sea freight, and the advantage which we possessed, in our greater contiguity to the consuming districts, and which would otherwise have counter-vailed against it, that we have lost, by what we deem to be the unfair rates charged by the North-eastern Company. I have a list here of 10 of the principal towns in the West Riding of Yorkshire, upon which our trade chiefly depends, the average distance of those towns from Hull is 63 miles. The average rate of carriage that we pay to the railway company is 9*s.* 3*d.* per ton. The distance from Hartlepool is 99 miles, and from Hartlepool they pay the same. The distance from Newcastle is 123 miles (I am now giving the averages), and the rate is still 9*s.* 3*d.* per ton. I should inform the Commission that the docks at Newcastle belong to the North-eastern Railway Company, and they have now a Bill in Parliament for purchasing the port of Hartlepool, and this of course would greatly aggravate the evil of which we complain. The average rate per ton per mile is $1\frac{3}{4}d.$ within a very small fraction from Hull, and when the same goods are sent from Hartlepool, it is a $1\frac{1}{2}d.$ per ton per mile, and from Newcastle it is eleven-twelfths of a penny. The railway company say that they can afford to carry for the greater distance at the lower rate, but I have taken out some places in order to give an illustration of their charges when the distance is increased: for instance, Hartlepool pays for a distance, on the average, of 99 miles, which is in the list I last referred to, 9*s.* 3*d.* per ton; Newcastle for 123 miles pays the same; Hull pays, for an average distance of 36 miles less than the rest, 12*s.* 6*d.* per ton. I have taken out six principal towns whose distance from Hull shall correspond, as nearly as I can find them, with the Hartlepool distance, for example, Bury, which is 96 miles; Rochdale, which is 88 miles; Todmorden, 79 miles; Oldham, 92 miles, Manchester, 98 miles; Bolton, 102 miles, giving an average distance for those places of 93 miles, and the uniform rate is 12*s.* 6*d.* per ton from Hull to those places, whose distances average 93 miles. Then I find that the places in the first list from Hartlepool average 99 miles distant, and the rate of charge for

99 miles from Hartlepool is 9*s.* 3*d.* per ton. Hartlepool pays, therefore, 9*s.* 3*d.* per ton for the longest distance, that is, 99 miles on the average, while Hull pays 12*s.* 6*d.* per ton for places at an average distance of 93 miles.

987. (*Mr. Glyn.*) Have you not been speaking of two different systems of railway in the statement which you have made?—No, that is our position.

988. It is not, I think, all the North-eastern line that you have been speaking of?—Yes.

989. For instance, Todmorden is not on the North-eastern Company's line?—The terminus is not on the North-eastern line.

990. But you have mentioned several towns in connexion with that part of Lancashire and Yorkshire to which you have referred, and none of them are on the North-eastern system, but they are on different lines of railway altogether?—I should explain that Normanton is the focal point where the North-eastern Railway terminates. I first instance Leeds and Normanton, and I then show that it is carried out to the more distant places, because they give to Hartlepool the benefit to all places of increased distance.

991. The rates on the North-eastern line to Normanton from Hull, from Hartlepool, and from Newcastle are the same, are they not?—Precisely.

992. When you get to those towns which you have mentioned in Lancashire and Yorkshire, then a higher rate prevails?—Yes.

993. Charged by a different company?—I carry the calculation to the more distant places in order to show that the disparity is continued as against Hull to all other places. If we want to send our goods to Manchester, we must pay the same rate for the shorter distance. The rate from Hull to Normanton is the same as from Hartlepool to Normanton. I give you the termini of the places on other systems of railways to show that the traffic of Hull is made to pay for all places beyond even the reach of the North-eastern Railway Company. The North-eastern Railway Company have a monopoly of all the coast from Berwick-upon-Tweed to the Humber, and we have no other means of conveyance; they are the only railway company by which we can send, with a small exception, and that is the Manchester, Sheffield, and Lincolnshire Company. They have a station across the Humber, and they take goods across from Hull; but by an arrangement with the North-eastern Company their rates are made the same, so that we derive practically no advantage from that. The North-eastern Company is the only company which has access to Hull, and from Berwick-upon-Tweed to Hull, with the exception of some short branches to Hartlepool, is all in the possession of the North-eastern Railway Company. These differences have been telling very seriously indeed upon the trade in the port of Hull, and we conceive that the case is much aggravated by the district being entirely in the hands of the North-eastern Railway Company.

994. (*Chairman.*) If I understand you rightly, what you complain of is, that you are in the hands of a single company; but the remedy for that is competition, is it not?—Not only that, but we complain that the same company having command of both the ports should deal unequally with them, and that they should say to Newcastle, although you are 120 miles distant, and Hull only 60 odd miles distant, we will carry your goods 120 miles at the same rate as for a Hull merchant, whose distance is not more than one-half; and that they should say to Hartlepool, we will carry your goods, although you are 36 miles more distant than Hull is, at the same rate. That is what we complain of; and we say to the North-eastern Company this,—fix your rate per mile; we are willing to pay the same as others; but do not make us pay for a small service that which you charge to others for a greater service.

995. (*Mr. Hamilton.*) What do they say to that?—Their reply is this: that it is the policy which they have pursued for seven or eight years, and it is the policy which they intend to continue. I went with the Mayor and two other gentlemen from Hull as a deputation to the North-eastern Company upon this subject about a month ago, and we stated our case to them. It was not new to them, for they had heard it before on similar occasions, and their answer was that that was the policy which they had adopted, and that was the policy which they intended to pursue. They offered no justification, and gave us nothing in abatement, neither did they point out any advantages that we had to compensate for the great disadvantage which I have mentioned. The reply was simply in the words I have repeated.

996. (*Mr. Glyn.*) Did you say that your firm had opened a branch house at Hartlepool, and that the chief reason for doing that was the difference in the railway charges from Hartlepool and from Hull?—We have sent many cargoes into Hartlepool, but we have not had an establishment there, because the Hartlepool Dock Company will by their agents do all our business for us at the Custom House, and besides that, settle the freights without any charge.

997. In fact, they are carrying on a very severe competition with Hull in those respects, and also as to dock charges, charges for freight, and charges of all sorts?—Just so; but we do not complain so much of that. Hartlepool has a natural advantage, and of course we do not seek for legislative interference to neutralize the advantage which Hartlepool possesses, but we do seek for legislative interference to protect us in the natural advantages that we possess at Hull, and which are neutralized by this unfair mode of proceeding. For instance, as to Leeds and Bradford, which I can speak of particularly, we have had branch establishments there ourselves. Leeds is 50 miles from Hull, and it is about 72 miles from Hartlepool; Bradford is 64 miles from Hull, and it is about 90 miles from Hartlepool, where we have had a very large establishment, almost the entire demand is supplied from Hartlepool, in consequence of the unequal rating of which we complain. The saving commences with a saving of sea freight, for the sea freight to Hartlepool being less, and the inland carriage being the same, it clearly makes the port of Hartlepool the cheaper port of entry.

998. (*Mr. Glyn.*) The smaller sea freight is the commencement of the advantage which Hartlepool possesses?—Yes; and that we cannot, of course, complain of. But what we say is that Hull has its advantages from its greater contiguity to the place of consumption, while Hartlepool is nearer to the place of production. Hull has always been the chief port of entry for the West Riding of Yorkshire; it is situated on the east coast, and possesses an advantage in its local position.

999. (*Mr. Hamilton.*) Did you say that the North-eastern Company offered no justification of the policy which they stated they intended to persevere in?—Yes; not any.

1000. Can you give the Commissioners any explanation of that?—None whatever. Perhaps I may add this, that when the North-eastern Company take the goods to or from Hartlepool, they get the full benefit of 84 miles of carriage, which has to be divided with other companies. In going from Hartlepool to Birmingham, for instance, they get 84 miles of carriage out of the entire distance; but from Hull they only get the mileage upon 48 miles. It is manifestly their interest, therefore, to send as much as they can from Hartlepool; and the same remark will apply as to exports. If the North-eastern Company, as I believe they are now trying to do, possess themselves of the docks at Hartlepool, and pay to the Hartlepool Company 4 per cent., they will make a purchase there of something like four millions in amount, from a Company which was said to be in the very lowest state of insolvency. The North-eastern Company have taken up Hartlepool, and they are going to guarantee to the parties a dividend of 4 per cent., which is much beyond that which its present revenue will support. They state in their published report that the amount which the North-eastern Company are going to give to the Hartlepool Company in the shape of 4 per cent. upon

Mr. S. West.
28th April 1865.

their capital will require a very considerable increase to their revenue, and also a further increase of accommodation. It therefore appears that the North-eastern Company will be boundby a very strong tie to favour the port of Hartlepool as against the port of Hull. I have accompanied two deputations to the North-eastern Company upon this subject; and upon the first occasion the North-eastern Company told us that they had entered into an arrangement with the Leeds and Thirsk Railway Company, and that they had engaged that it should be in perpetuity; that the rates should be charged as much from Hull as from Hartlepool; that they had engaged to do that, and that they should not deviate from it. That was the first answer that we received. I then inquired of them whether it was their intention to give us at Hull the benefit of a shortened distance, by making a new line to Doncaster, which would have the effect of bringing Hull 18 miles nearer to the Midland counties. To that they declined to give me any reply. The last interview that we had with them was a month ago, when they said that they had adopted a policy from which they would not depart.

1001. (*Mr. Dalglish.*) Have you an establishment both at Hull and at Hartlepool?—We send cargoes to Hartlepool.

1002. What is the centre point between Hull and Hartlepool on the North-eastern line?—The halfway distance I cannot give you, but Normanton is the focal point.

1003. I am assuming that you hold a stock of timber at Hartlepool and a stock of timber at Hull?—Yes.

1004. There is, of course, a central point on the railway system between Hull and Hartlepool?—Yes.

1005. From which of those two ports, if you received an order from that central point, would you send your timber?—From Hartlepool, if we had it there, because it would cost us less.

1006. From Hartlepool to the central point it would cost less than from Hull to the same central point, the distance either way being the same?—Yes, it would.

1007. Upon what principle would you do that?—it costs us less at Hartlepool we would send it from Hartlepool, or, as it would cost no more carriage to the place of delivery.

1008. (*Mr. Glyn.*) Take any place short of Leeds, would the charge from Hartlepool and from Hull be the same with regard to the docks?—Yes, precisely; I may explain that it operates in this way; our buyers inquire the price of any particular article in our line; we send them the price, and then they say, I cannot give you so much as this, because I can get the article for so much less at Hartlepool, which is just the difference that the goods have cost us.

1009. (*Mr. Dalglish.*) I want to ascertain what the rate on the railway is between Hull and the supposed central point, and also from Hartlepool to the central point?—I do not clearly understand what is meant by central point. Normanton is the point where the traffic from Hull and from Hartlepool converges.

1010. (*Mr. Glyn.*) Suppose you wanted to supply a customer at York, would the North-eastern Company charge you the same railway rates from Hull as from Hartlepool to York?—I think they would; York is rather peculiarly situated, we have a cheap water conveyance to York; the rates are somewhat lower. The distance from Hull to York is only about 40 miles, while from York to Hartlepool the distance is 80 miles; but if you take Leeds or Wakefield, or any of the principal manufacturing towns of Yorkshire, then the question would apply.

1011. I understand from you that what you have stated applies to all the towns beyond Normanton, but that short of Normanton, upon the North-eastern system, there is a varying charge. Is there not as between Hartlepool and Hull?—None; Normanton is upon the North-eastern system, and the rate from Hull to Normanton is the same as from Hartlepool to Normanton.

1012. Take York. What would the rate from Hartlepool to York be?—I do not think I have the rate here from York to Hartlepool.

1013. Would it be the same rate as they would charge you from Hull to York?—I am not certain about it.

1014. You do not know whether, upon their own system, they have a uniform rate, or whether it is a varying rate?—There is a uniform rate; take Leeds, for example. Upon their own line they go direct there. I think there is a difference of a few pence in the case of York in favour of Hull, as compared with Hartlepool. York is a place which is always supplied by water, and we therefore take very little notice of the railway rates.

1015. (*Mr. Horsfall.*) Does the water carriage compete with the railway carriage?—Yes; and they have not been able to supply York. The rate from Hull to York, I think, is something like 6*s.* or 7*s.*, and we can send goods by water for between 4*s.* and 5*s.*, and therefore the railway charge does not affect the question. Leeds is on the North-eastern system, both from Hull and from Hartlepool. The distance is about 22 miles greater from Hartlepool, but the rate of carriage is the same to Leeds.

1016. (*Chairman.*) Your objection, I think, amounts to this, that there is not a uniform mileage rate established over the North-eastern system?—Just so.

1017. You do not complain, as I understand you, that your own goods are carried at too high a price from Hull inland, or *vice versâ*, but that on other parts of the line the scale of charges adopted is too low?—Just so, and that the disparity amounts to an extra charge of 3*s.* a ton. If the railway company charged us at the same mileage rate as to Hartlepool it would make 3*s.* a ton difference.

1018. What you wish for is, that the rate to Hartlepool should be raised, so as to place you upon an equality with them?—Either the one or the other. I think that the Hartlepool rate, as compared with the charges made on other lines of railway, is about a fair average rate, 1½*d.* per ton per mile, while we pay 1¾*d.*

1019. The railway company having an interest of their own at Hartlepool, think it best to carry goods there at a very low rate?—No doubt.

1020. (*Mr. Hamilton.*) If the North-eastern Company obtains possession of the docks at Hartlepool they will have a still further interest in prejudicing Hull for the benefit of Hartlepool?—Unquestionably.

1021. (*Mr. Gower.*) Is the trade of Hull increasing?—I think it is somewhat increasing, but not in proportion to the generally increased trade of the country.

1022. It has not increased in the same proportion as in other places?—No. I have before me a return of the imports of timber into Hartlepool for the last four or five years, and it appears from that, that in the year 1861 there were 57,250 loads; in 1862, 85,724 loads; in 1863, 121,625 loads; and in 1864, 136,005 loads. And from my knowledge of the timber trade I have no hesitation in saying that four-fifths, if not nine-tenths of the 136,005 loads sent to Hartlepool last year, were sent in by Hull merchants, for their own trade, and not for local consumption at Hartlepool. I further believe that if it was not for these unequal rates the Hull merchants would bring all their timber into Hull.

1023. Supposing that your policy was adopted by the railway company, would the Hull merchants withdraw their establishments from Hartlepool?—I should say that they would generally do so.

1024. Would you do so?—I should certainly do so.

1025. Whatever benefit from the change of policy would be derived by Hull would be lost by the other ports, would it not?—Yes, of course the same traffic would not go to two ports.

1026. (*Mr. Horsfall.*) The traffic to which you have referred is traffic which entirely belonged to Hull, and which has been driven to Hartlepool by the exorbitant charges of the railway company?—Unquestionably.

1027. (*Mr. Dalglish.*) Is the sea freight to Hartlepool not lower than to Hull?—Yes, it is, and that was the origin of all the evil. That arises, not only from the low port charges, but from their being able to obtain a cheaper supply of coal. At the present time we are trying to charter ships for Hull, but the ship-owners say, No, we will go to Hartlepool because it will cost us so much less. I have had conversation with some of the principal ship-brokers in Hull, who say that they are chartering two ships for Hull merchants to go to Hartlepool when they are chartering only one to Hull.

1028. (*Mr. Glyn.*) The freights are lower at Hull, are they not?—No, higher.

1029. (*Mr. Hamilton.*) Are the dock dues higher at Hull?—I think they are higher at Hull.

1030. (*Mr. Lowe.*) Very much higher?—I think from the Baltic the rate is 6*d.* per ton at Hartlepool and 1*s.* at Hull.

1031. And the dues of the dock company?—Yes.

1032. Are there not other dues, is there anything to pay now to the Hull Trinity House?—Yes; they still receive a charge of 3½*d.* on the timber per load.

1033. Are there any town dues at Hull now?—No; they are abolished.

1034. (*Mr. Glyn.*) The dock dues are double at Hull, are they not?—Yes; I may mention that some years ago, I think it was in the year 1852, when I was a dock director and a member of the corporation, an effort was made by the town of Hull to enable it better to compete with Hartlepool, and the three corporations, viz., the corporation of the town, the dock company, and the Trinity House agreed to make simultaneous reductions in their dues. The dock company gave about 20 per cent., which was 3*d.* a ton; the corporation gave up a charge of 4*d.* per load upon timber, and the Trinity House gave up about 2½*d.* or 3*d.* also, making together a reduction in the local charges in the port of Hull of between 10*d.* and 1*s.* a load, in order that the merchants of Hull might be able the better to compete with other ports. Now, as timber merchants, we see that that 1*s.* which was sacrificed or given up by the corporations for the benefit of the trade of the town is more than neutralized by our having to pay 3*s.* a ton, or something equivalent to that, for railway carriage more than Hartlepool.

1035. (*Mr. Dalglish.*) If you charter a vessel to go out for timber, can she not get a cargo at Hartlepool much cheaper than she can at Hull?—Yes; she can.

1036. (*Mr. Hamilton.*) And then you say that the railway charges aggravate that?—Yes.

1037. (*Mr. Horsfall.*) Are the docks at Hull private property?—Yes, they are.

1038. What dividend do they pay?—The dividend has been regulated by their last Act of Parliament, and at the present time they pay 5 per cent. dividend upon a reduced amount.

1039. Then I presume that there is no room for further reduction in the dock charges?—I think that the outlay by the Dock Company now is so great, for they are laying out a very large sum of money in extending one dock and in making another, that it would be a very great point indeed if they can make their revenue equal to their charge. I should like to point out to the Commission just how our trade at Hull is affected. Our customers say, We can purchase at such a price at Hartlepool, suppose a standard hundred, say 5*s.* or 10*s.*, less than at Hull. The consequence is that we are obliged to take the Hartlepool price and sacrifice our profit, or lose the sale, and the order goes to Hartlepool. The same will apply to the corn trade. A case came under my own notice. I have seen a letter from one of the largest corn merchants in the kingdom; he wrote to the Chamber of Commerce to inquire about this disparity of rates, and he pointed out that he was getting corn through Hartlepool at 6*d.* a quarter less than he could obtain it through Hull; he wanted it to be sent to the centre of the kingdom, and that it was a saving of 6*d.* to him, as it cost the same from Hartlepool as it did from Hull by railway, and that therefore of course he should order it through Hartlepool. This was an instance of one of the largest merchants in the kingdom adopting that course; but as I have stated, he wrote to the Chamber of Commerce for information on the subject, and pointed out how unfair it was to the port of Hull, that Hull, being so much nearer to the centre of the kingdom, should pay the same rate. Of course it was a matter of indifference to him, as he said, which way it came, but 6*d.* a quarter was a profit, and the goods are therefore going into Hartlepool.

Mr. S. West.
28th April 1865.

1040. (*Mr. Glyn.*) Did it not arise from the freight from the Baltic being less to Hartlepool than to Hull?—Yes; but if we want to send the same distance, then we pay a higher rate. I have already pointed out to the Commission what we pay; when we go 93 miles from Hull our rate is 12*s.* 6*d.*, but when they send from Hartlepool, 99 miles, the rate is 9*s.* 3*d.* We say to the Company, If you will take goods a distance of 99 miles for 9*s.* 3*d.*, surely we ought not to pay more for 93 miles.

1041. (*Chairman.*) I think we understand your desire to be that there should be a uniform mileage rate for carriage to all large towns, and that the railway company should not have the power to deviate from that?—Just so; that is as to the North-eastern Company, for we have confined our attention to our own grievance.

1042. But I presume the arrangement which you think desirable as to your own district would apply equally to any other?—Decidedly, I think so.

1043. Have you anything to add to what Mr. Atkinson has already stated upon the next point, viz., the running of steamboats by railway companies?—The Manchester, Sheffield, and Lincolnshire Railway Company have obtained powers to become proprietors of steamboats, and we are apprehensive that the North-eastern Company may succeed in doing the same. If the North-eastern Company become proprietors of steamboats, and run them to their own port of Hartlepool, supposing that they obtain their bill for amalgamation, they might do that to an unlimited extent, and the town of Hull in that branch of trade would be ruined.

1044. (*Mr. Glyn.*) Have the North-eastern Company applied to Parliament for powers to that effect?—They have applied for an amalgamation.

1045. But have they applied for powers to run steamboats?—No, they have not.

1046. (*Chairman.*) Is there anything else that you would wish to state?—There is only one other point which I think is worth notice, which is, that the gradients upon the Hull and Selby line, or the line from Hull to Normanton, are very easy; the line is upon a dead level; there is no tunnel and very little cutting; it is almost on a dead level for the whole distance. I believe that the gradients from Newcastle and from Hartlepool are of a much more serious character, and if there were any reason why a difference in the charge should be made, in consequence of the greater cost of the line, it would be all in favour of the Port of Hull.

The witness withdrew.

Adjourned to Wednesday next at 12 o'clock.

Friday, 5th May 1865.

PRESENT:

The Right Hon. the Earl of Donoughmore.
The Right Hon. Lord Stanley, M.P., F.R.S.
The Hon. E. F. Leveson Gower, M.P.
Sir Rowland Hill, K.C.B., F.R.S.
J. A. Roebuck, Esq., M.P.
T. B. Horsfall, Esq., M.P.
Robert Dalglish, Esq., M.P.
Geo. Carr Glyn, Esq., M.P.
Capt. Douglas Galton, R.E., F.R.S.
E. T. Hamilton, Esq.
J. R. M'Clean, Esq., Pres. Inst., C.E.
William Pole, Esq., F.R.S., *Secretary.*

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S., in the Chair.

Mr. W. T. Mulvaney.

5th May 1865.

Mr. William Thomas Mulvaney examined.

1047. (*Chairman.*) You were formerly, I believe, a Commissioner of Public Works in Ireland?—Yes.

1048. For a considerable period of time?—I was in the Government service altogether about 27 years.

1049. How long is it since you ceased to be a Commissioner of Public Works?—Since the year 1852.

1050. Since that time, I believe, you have been resident in Prussia?—Yes, since 1855.

1051. How have you been occupied there; what was your object in going there?—I was owner of a part of two large colliery concessions there, and had the sole management for my partners and myself.

1052. In what part of Prussia were those collieries?—Westphalia is where the collieries lie, but I live in Dusseldorf.

1053. Has your attention been called, both in Ireland and in Prussia, to the railway system generally?—In Ireland it was constantly, in my early official capacity, not directly with the original Railway Commission, but the members of the Railway Commission were at that time Sir John Burgoyne and others with whom I was connected in office, and subsequently Sir John Burgoyne became Chairman of the Board of Public Works, of which I was a member, and we therefore had very much to do in connexion with the question of railways generally in Ireland. Afterwards I proposed the construction of the Midland Great Western of Ireland Railway, and recommended to the Government the granting of a loan for that portion of the line which extends from Athlone to Galway, with a view to develop the resources of the west of Ireland, which at that time contained about three millions of inhabitants, but now considerably less.

1054. In what capacity did you recommend that?—As a Commissioner of Public Works.

1055. What was that commission on Irish railways of which you have spoken?—A railway commission appointed by the Government before the construction of railways in Ireland to investigate the best system on which railways should be constructed. Mr. Drummond, who was then Secretary of State for Ireland, was, I believe, the chairman of that commission, in 1837 or 1838, I think. I had afterwards, following your Grace's question, to give evidence on Lord Granville's commission as to the packet stations in Ireland, and on that occasion I devoted much attention to the railway systems in Ireland, and the connexion of the railways with each other and with the harbours, especially in Dublin.

1056. Your attention has been also called to the railway systems in Germany?—Yes; and there it was called to them in my own interest in connexion with the collieries which I have mentioned. My partners and I being strangers in the country, and having commenced the working of the collieries in the midst of 200 or 300 existing collieries, the necessity arose to find markets for our produce, and we resolved at an early period to seek the most distant markets, where we would come least in competition with the existing collieries. At that time, owing to the high rates for the transport of coal, coal did not go by rail much more than about 10 German miles, which is about 47 or 50 English miles, taking a radius from the centre of the coal district of Westphalia.

1057. Was no coal carried further than 50 miles?—Not much by railway, the prices were so high, but by water; it did go by the Rhine. Afterwards, in consequence of a reduction of the fares, obtained after a long struggle, we were able to send it, and the coal goes at present about 100 German miles, or rather over 100 German miles, something more than 500 English miles.

1058. Was that entirely owing to a reduction of the charge that had previously been made?—Quite so; it was impossible before; the rates were so high that the coal from Westphalia could not reach those distant districts; the price exceeded what the coal was worth, and it could not compete with the English coal on the sea coast, or with the coals, and wood, and turf in other districts. The agitation or struggle that was made for this reduction I believe will be a matter of interest to the Commission, inasmuch as the difficulties existing in Germany even surpassed those which might be supposed to exist in Ireland. The various number of small states and governments existing in Germany, in addition to the various number of railway companies, rendered any co-operative action for a common object excessively difficult. The arguments that I was enabled to bring forward were chiefly from England, where, in the matter of mineral traffic, they had made a very considerable advance as compared with that the Continent had made. I visited most of the governments and the ministers of commerce of each of them, in conjunction with a deputation of the coal owners, for the purpose of arguing with them and convincing them of the advantages that would result to the railway companies themselves from a reduction in the freights, and especially for fuel. We were met constantly with the argument, that the circumstances in Germany were different from what they could be in England; and there was a disbelief, in fact, on the part of the ministers of Prussia that such rates, that is, a halfpenny per ton per mile, could exist in England. I was compelled, in consequence of this, to collect from our blue books and from friends the actual state of facts, and I wrote a small *brochure*, which was handed about, and at last, with the assistance of professional men in Germany, we were able to state to most of the railway boards, that the original cost to them of the carriage of coal could not materially exceed a farthing a ton per mile, and therefore if they assented to the proposition which we made (it would be in German money one pfennig per centner a German mile), which is somewhat less than a halfpenny a ton per English mile, they would have a fair profit. Having made these statements, and sustained them by proofs from England and by communications from the German authorities, there was a disposition to go into the matter, but I should have failed had it not been for the assistance afforded to me by the manager of the Dutch-Rhenish Railway, from Amsterdam and Rotterdam to Germany. This gentleman was an Englishman, Mr. Forbes, now general manager of the London, Chatham, and Dover Railway, and the company being for the greater part English, the majority of them were more open to conviction on such a matter. Their shares were at a very great discount, they had no coal trade, but they had a number of coal waggons. Mr. Forbes entered with a full and liberal spirit into an arrangement with me, and placed the waggons of their company at my disposal, provided that we sent regularly given

quantities into Holland at our own risk, and at the low rate that I have mentioned. We had a difficulty still; our collieries were on the side of a German railway, and the coals had about 50 miles to travel before they reached the Dutch-Rhenish Railway. Owing to the Dutch-Rhenish Railway Company giving their waggons and entering into such an arrangement with me, we temporarily got a rate from the Cologne and Minden Railway on which our collieries lie to make an experiment, and we ran for a year or two.

1059. (*Mr. Roebuck.*) Those 50 miles which you have mentioned were German miles, I suppose?—No.

1060. Your coals had to run 50 miles before they reached the Dutch-Rhenish Railway; were those 50 German miles?—Fifty English miles, about 10 German miles; the whole distance to Amsterdam was about 125 English miles, and the distance to Rotterdam (the sea ports and termini of the Dutch-Rhenish system) was 136 miles, I think. So far we made the experiment. I brought these facts before the North German union of railways. I may explain to the Commission that some of the difficulties in Germany with regard to the various governments and various railway directions are got over by forming a union of railways for the common through traffic. We failed in succeeding for a year or two to convince the North German union, which included the kingdom of Hanover and Brunswick, which lie between the two divisions of Prussia, until we finally effected the object in this way. Thirty-two collieries entered into a guarantee to deliver, I think, 25,000 tons within one year at Magdeburg on the Elbe, at the rate that we had proposed, subject to a penalty, in case we failed in sending that quantity regularly, of a very heavy fine, I believe equivalent to the original freight, and I may state that the original freight was very high.

1061. (*Chairman.*) What was that original freight?—I cannot give you the figures at the present moment. For experiment I sent two waggons of 10 tons each of our best coals from our own colliery to Magdeburg; it was allowed to be fully equal to and was purchased at the same price as the English coal, but instead of my receiving anything back for the two waggons, I had to pay 2*l.* in addition for the freight: the original freight I have not got.

1062. It was very much higher I presume?—Yes, it was quite prohibitive. We succeeded in the experiment, but mainly by the fact of our collieries supplying the quantities at a risk when many of my German neighbours fell off in their deliveries, and the burden fell for the greater part on our own shoulders. We succeeded from that day forth, and the advantage of a low freight was proved in North Germany, and it has worked with extraordinary success since. But to illustrate the difficulties, the kingdom of Hanover which has railways chiefly managed by the State, and at the same time is the owner of collieries, interposed, at least on the part of the State, more than on the part of their railway board, very considerable difficulties, and for a full year all that Hanover would concede was to allow the coal to run through the kingdom to the opposite side of Prussia, but it would not allow any to be delivered in Hanover itself.

1063. (*Lord Donoughmore.*) Can you say when these low rates were introduced?—It was in the year 1860. In the middle of 1858 I commenced to produce coal, and our agitation began immediately, and I think the experiment was made in the year 1860.

1064. (*Mr. Horsfall.*) For what distance can you now run at the low rates?—To Munich, to Switzerland, and to Berlin, about from 75 to nearly 100 German miles.

1065. (*Chairman.*) That is about 500 English miles?—Yes.

1066. (*Mr. Horsfall.*) Did all the railway companies agree to take it at the same rate?—That was the very difficulty which is not yet overcome. The various branches of the railway systems in Germany have not yet come fully into the arrangement. There are various state jealousies and various jealousies between the various railway companies which have prevented it.

1067. (*Mr. Glyn.*) The rate is rather less than a halfpenny per ton per mile, is it not?—It is. The halfpenny per ton per mile would be a fraction more than one pfennig per centner per German mile.

1068. Did you find your own waggons?—No; the waggons are found by the railway companies.

1069. That is rather less than the English rate, is it not?—Yes; but I should observe, if you wish to go into detail, that they also charged for terminals, in some cases 3*s.* a waggon of five tons at each end of the system, whatever it was. This was a fruitful source of jealousy, because the station from which the mineral went, or the railway from which it went, to the railway on which it arrived had more benefit from the transport than the country through which it passed without stopping.

1070. (*Chairman.*) Are you still working your coal over the Dutch-Rhenish line?—Extensively.

1071. Can you state whether the result has been satisfactory to the railway companies as well as to you?—The result to the Dutch-Rhenish has been extraordinarily good. The Dutch-Rhenish line was formerly supplied from England, and as Rotterdam and Amsterdam are the nearest ports to England, they received a supply; they commenced, however, encouraging the system of taking the coal from Germany for their locomotives, by which they at once got a steady supply and a regular supply, weekly or daily, as they required it, and they were enabled to save a large outlay in storing up coals that should arrive by ship; they used coal instead of coke, and they effected a great saving in locomotive power thereby; and from having no trade whatever in coal over their line they arrived last year at 147,000 tons from Germany alone over their line.

1072. (*Mr. Glyn.*) All these contracts were founded upon quantity, I suppose?—They were founded upon the regular through running of trains with a minimum quantity of 200 tons in Holland, and we can load or send 400 tons in Germany.

1073. (*Lord Stanley.*) You have given us the actual rate charged, but you have not given us the amount of reduction which took place?—I have stated that I am at a loss to give you the precise tariff, but all that can be supplied to you.

1074. Can you tell us roughly what it was?—It was prohibitive, and where no coal then went there is now a very large trade.

1075. What we wish to know is, what was the amount of the tariff which was prohibitory?—I will take Berlin as it is now. To reach Berlin with this new tariff and with the two terminals we could not compete with England, so that the 3*s.* that was charged for terminals at Berlin was obliged to be given up. I have already stated the fact of the coal that I sent to Magdeburg returning the coal owners nothing, and having to pay in addition.

1076. (*Mr. Dalglish.*) What is the distance from the colliery to Magdeburg?—About 54 German miles, or about 250 English miles.

1077. (*Chairman.*) Should you imagine that the old charge was three or four times as high as the present one?—I will supply the facts; I do not remember.*

1078. (*Mr. Dalglish.*) You stated, I think, that you sent two waggons with 10 tons each?—Yes.

1079. Do you know what they sold for at Magdeburg?—No; it is several years ago.

1080. (*Captain Galton.*) You said that English coal could compete with you at Berlin. How does

* The rate, I have since ascertained, was 30 thalers 10 silver groschen for five tons, or about 18*s.* 3*d.* per ton, being rather more than the selling price of the coal there in former seasons.

Mr. W. T. Mulvaney.

5th May 1865.

the English coal reach Berlin?—It reaches Berlin through Hamburg and through Stettin.

1081. From Hamburg how does it go to Berlin?—By water, by canal; it could go by railway, but it goes chiefly by water.

1082. (*Mr. Hamilton.*) Are the present rates still conditional upon your supplying a certain quantity to the railways?—Yes; they are still conditional upon our sending full trains to run through from station to station. That was my own proposal founded upon the English practice, as I knew thereby that the railway could have a very large profit at a low freight.

1083. (*Mr. Glyn.*) When you say through trains, can you tell us the number of tons or thereabouts?—A train load is 200 tons; that was the minimum for each train.

1084. (*Sir R. Hill.*) To whom do the railways in question in Germany belong?—In Prussia a number of them belong to the State; part of them belong to the different states. Most of them through Hanover belong to the Government of Hanover, and in Brunswick to the Government of Brunswick. The Prussian railways in that line are all private.

1085. (*Chairman.*) The Dutch Rhenish Railway is private, is it?—Yes, it is chiefly English.

1086. (*Mr. Glyn.*) In this union of railways in North Germany who fixes the rates, does the union fix them, or is there a committee that fixes the rates, or do they make their own separate rates?—The union consists of various boards united together, and they have frequent meetings—I think monthly—and general meetings of the deputies from each board, and one great meeting yearly.

1087. Do they fix the rates?—Yes; they fix every through rate.

1088. Irrespective of the boards themselves?—Yes; they are deputed by the boards.

1089. They can fix the rates?—Yes, for through traffic.

1090. For the whole of the Union?—Yes.

1091. (*Chairman.*) Are you still proceeding in extending the system, and carrying your coal at low rates over the other German railways?—It is itself spreading; since the seed was sown the fruit has been obtained, and large profits direct and indirect arising to the railways, they have themselves extended the system.

1092. Is the German Union satisfied with the results?—I have only, as yet, spoken of one; there are several German Unions, and there are classifications of railways in unions according to local circumstances.

1093. Those systems, now that the experiment has been tried, are satisfied with the result?—They are so important to the country; first to the trade, and, secondly, to the railways, that you will, perhaps, permit me to give you the figures. In the year 1859, taking the Westphalia coal districts, when the low fares first came into operation at all, the Westphalian districts produced 3,800,000 tons of coal. In the year 1864 they produced 7,500,000 in round numbers, and a totally new life has been infused into the industry of all the countries, agricultural and manufacturing, through which this cheap coal has been brought. The coal owners had reduced the price of coal at the pit's mouth to the lowest that it could bear. We asked the railway companies to join us as the natural means of attaining markets by reducing their freights, and when they did agree factories grew up in Brunswick, in Hanover itself, and numerous other districts, and the consumption of coal has increased enormously, so that this doubled increase of production cannot now meet the demand.

1094. Are the collieries in Westphalia capable of producing a larger amount than they do at present?—The Westphalian district, I think, contains as much coal nearly as all England; it is very rich, there are a great number of workable beds lying under each other, but the collieries, are not capable at present, of producing the quantity which is required.

1095. (*Sir R. Hill.*) Why so; what is the reason of that?—Their mode of production is not quite equal to ours as to quantity; they are satisfied with producing 300 or 400 tons, or much less per colliery; they do not do as they do in England, or as we do there; we produce 600 or 700 tons per colliery.

1096. (*Mr. Glyn.*) Do not they apply capital enough?—I do not think it is a question of capital so much as it is a question of exertion and the kind of demand that has been exacted for superior preparation of the coal; there is also a deficient supply of coal labour.

1097. (*Mr. Horsfall.*) Do you mean 600 or 700 tons per day or per week?—Per day. We produce from our two collieries and sell over 300,000 tons in a year.

1098. (*Chairman.*) Have the railway companies also adopted the sytem of lowering the rate on other articles of merchandise as well as coal?—Yes, considerably in other articles since the result in the case of the coals has been seen, and progress is still making, for they are very much pressed by the iron manufacturers to do so; they have not yet advanced in the reduction upon the raw iron itself so much as they feel convinced they must do; they are going very slowly forward, but they have reduced the rates considerably. The results, I have no doubt, will be very interesting to the Commission when I lay them before them, especially with regard to the increase of income which has been derived from these reductions to the railway companies. I will take a report, which is rather an extensive one; the yearly report of the Cologne and Minden railway. They have furnished a chronological table since the commencement of the railway in 1848, and the report to which I am about to refer terminates with 1863; at the end of each year's report they give this chronological table. Their income has very much increased since the establishment of these low fares. In 1859 their income amounted altogether to 4,600,000 thalers. It has increased up to the year 1863 to 8,300,000 thalers.

1099. Is there any greater mileage at the present time than there was in the first year?—There is. The mileage has increased from 46 to 71; that was, however, chiefly in 1862 and 1863.

1100. (*Sir R. Hill.*) Are you about to give us the gross receipts?—Yes, at this moment; but the greater portion of that income has been derived from the carriage of goods; the increase in goods has been from 2,900,000 thalers to 5,300,000; whereas the passenger traffic, which soon reaches its maximum, notwithstanding the increase which has taken place in the mileage, you will see has not very importantly increased; but it has increased from 1,300,000 thalers to 1,640.000. and those figures of 1,640,000 occur first in 1862, when the greater length of the line was opened.

1101. (*Mr. Roebuck.*) There has been no diminution in the fares for passengers, I suppose?—None; but when I come to the case of the passengers I shall show you that the passenger fares in Germany upon this line are very low.

1102. (*Captain Galton.*) The increase that you have given as in the goods, is not much more than the proportion due to the increased mileage; you said from about 3,000,000 to 5,000,000?—Yes; but from my local knowledge I am aware that the new mileage which has been opened had not been a great source of increased income in goods; it is now only commencing to develop the goods traffic upon the line; it is a line from Deutz to Giessen in the direction of Frankfort. The main point which I wish to show is this, that the great increase, as admitted in their own report in distinct terms, has been derived from minerals, since the reduction they made in the rates. The two stations which have most contributed to that increase have been the two stations near to which our collieries are situate, and

where our works were expressly constructed for the purpose of affording to us the means of filling those express coal trains rapidly, and despatching them to the various parts of the North of Europe.

1103. (*Chairman.*) What has been the result in the shape of dividends?—Every reduction of the rates, whether in the passenger traffic or in the goods traffic, appears from this table at which I am looking to have been accompanied with an increase of dividend. I will take the extremes as regards the traffic to which we are now referring. Their rate in 1848 was 4·34 pfennigs. The next year it was 4·60. The rate for the carriage of goods is taken here per centner, and per German mile. If you will take the figures as comparative, they will convey the idea. In 1863 the rate was 2·29, therefore it was very nearly a half. Of course we cannot speak of the profits in the first year of the opening of a railway, but in that year the profit upon the capital expended 4·17 per cent. That which they divided among the shareholders was 3½ per cent. in the year 1848. The total sum that they earned on all their capital in 1863 was 7·65 per cent., and they paid their shareholders 12 and 1½ths per cent., and this year they will pay them 15 per cent. probably.

1104. (*Lord Donoughmore.*) Do you say that they earn 7 per cent. and pay 12 per cent.?—Yes, and that is an interesting matter to which I will call the attention of the Commissioners with regard to part of the policy of the German railway companies. The proportion of the loan and priority shares, the amortissement of which is partly paid off every year is very much larger than it is in England, their mode of financing is very different from ours. The chief increase in profits I find has taken place from the year 1859. At that time they paid 7 ⅞ths per cent. to their shareholders, and in 1863 they paid, as I have already stated, 12 1½ths per cent. With regard to the money earned upon the whole capital, which was expended in 1859, they made 7·94 per cent., and they made 9·80 in 1860, when the traffic in coals came to be very considerable, through the low rates, and in 1861 they made 11·27 per cent. Then suddenly during the two years when the new extended line came in, which was very large, they fell down in their earnings to 8 per cent. and 7·65 per cent. upon their whole expenditure, because before that time they were making their new line out of capital, and the charges did not come into play.

1105. (*Sir Rowland Hill.*) Are you now giving the net earnings?—Yes, the words are expressly the net earnings per cent. on the expended capital.

1106. (*Chairman.*) Do you know what the extended mileage of that railway is?—I do, it is 71 German miles. For the Cologne and Minden Railway the total capital expended has been 9,341,000*l.*

1107. (*Capt. Galton.*) What is the length of the line?—The length of the line is 218 and 113 English miles. The cost of the first 218 miles will be interesting to the Commissioners to know with reference to the subsequent matters. It was 22,680*l.* a mile, and for the 113 miles the cost was 34,608*l.* a mile, but that includes the bridge at Cologne.

1108. (*Chairman.*) Does that include the rolling stock?—Yes, and all other expenditure; which shows that after all this has been a very expensive line. I have already stated that they divided in 1862 12 1½ths per cent among the shareholders, but to illustrate their mode of finance I may repeat that their total capital was 9,341,175, but the proportion of that upon which they paid dividends is only 1,950,000*l.*, or say 2,000,000*l.* in round numbers. That principle also applies to many other German railways, as they take a very large portion of capital up in loans and priority shares, or, as we call them in England, preference shares, which are, however, payable off in the course of a certain number of years at a moderate rate of interest and sinking fund, so that in the end the railways are becoming more valuable every year.

1109. (*Mr. Glyn.*) Is that sinking fund formed out of the receipts of every year?—Yes.

1110. (*Chairman.*) And the capital, in the case to which you have been referring, will ultimately be reduced to something under two millions?—Yes, but the Government subscribed largely to the Cologne and Minden Railway, and guaranteed interest, in consequence of which they are entitled to receive back the railway after a certain given period or years.

1111. Are the priority shares and the money which is borrowed on the lines at very low rates?—I have the exact rates here, and I believe they are 3½, 4, and 4½; they very rarely go up to 5.

1112. (*Mr. Hamilton.*) Is it in preferential stock or in debentures?—I am not quite certain about that, I think they are in debentures; but they are amortissable, or may be paid off.

1113. (*Mr. Horsfall.*) What do you mean by annuity shares?—I mean that they may be paid off in the way of terminable annuities; they pay off a certain sum of money, with, say 5 per cent., 1 per cent. sinking fund and 4 per cent. interest, till all is paid off.

1114. (*Sir Rowland Hill.*) It would be like what we call terminable annuities?—Yes. But in addition to this it is complicated in this case with the fact of the Government having given a very large subvention, they being part owners of the railway, and having certain powers to become owners of the railway by purchasing shares it at par from year to year.

1115. (*Mr. Glyn.*) As I understand you, the redemption fund is made up from the annual earnings on the railway?—Yes, always, and they distinguish that in their report. I may inform the Commission that there is scarcely a fact which they may desire to know as to some of these German railways that is not to be found in their annual reports. Of course I have not got them all in my head, because they do not interest me more than for the purpose of seeing what the general policy is.

1116. What is the system pursued by the German railway companies as to passenger traffic; are the fares high or low compared with the passenger fares in England?—The fares are considerably lower than they are in Ireland, at least upon those railways to which I have particularly addressed myself. They are about one-half. The fare for a first-class passenger in Germany is 1½*d.* per mile. The fare for a second-class passenger is 1*d.* per mile, for a third-class passenger ¾*d.* and for a fourth-class passenger ⅜ths of a penny per English mile.

1117. Has there been any reduction made in the rates, or have they always worked at those rates?—There have been some slight reductions made which are perceivable by the averages in the statistics for the whole of Germany.

1118. But there has been no such reduction in the passenger fares as in the rates charged upon coals?—No; I have now before me the annual statistical statement which was published for the year 1862 by the house of Parliament, and I may observe that in the whole of the Prussian system of railways, the income derived from passengers and what belongs to passengers is 30 per cent., from goods and cattle 63 per cent., and from other sources 7 per cent. The proportions of the receipts from passengers over the whole of the Prussian system of railways, divided into classes, is as follows:—From the first class only 19/10ths per cent., from the second-class 17 per cent., from the third-class 49 per cent., and from the fourth-class 32 per cent. These are the facts over the whole of the Prussian system relating to the year 1862.

1119. (*Mr. Gower.*) Has there been any reduction made in the rates charged for the conveyance of other goods and merchandise besides coals?—A considerable reduction has been made in what they call their reduced class of goods; they are iron ores chiefly, and earths, limestone, and matters essential for the production of iron.

Mr. W. T. Mulvaney.

5th May 1865.

1120. With regard to manufactured commodities, has there been any reduction made ?—I am not prepared to state that at present, but I can furnish that information for the Commission. I know for through rates and in competition with water carriage and foreign railways, considerable reduction has been made.

1121. (*Sir R. Hill.*) You have given us the rates charged for passengers upon the German railways. Are any return tickets issued, or are there any arrangements like those in England as to return tickets ?—Very few, excepting in particular districts. In the private railway companies they are getting into that practice.

1122. Do they issue season tickets ?—No.

1123. Do they make reduced charges for excursion trains ?—They have done so on the Rhine—on the Rhenish railway.

1124. If you take those matters into account, how would the rates charged upon the German railways compare with the rates charged upon the Irish railways ?—I should think that they would tell considerably against the Irish system, because the average of all the railway traffic in Prussia for all classes of persons is only 8/10ths of a penny per mile.

1125. Can you tell us the average charge in Ireland, taking into account the return tickets and the excursion trains ?—I have not got the statistics here, neither are they in my possession, but from the information that I have obtained I understand that the fare for a first-class passenger in Ireland is about $2\frac{2}{10}d.$ per mile, for second-class passenger $1\frac{1}{2}d.$ and 10 per cent. added, and for a third-class passenger $1d.$ If the Commissioners will allow me I will take 100 miles in both countries, reminding you at the same time that the greater part of Ireland, taking, as the guide, the standard of wages, is much poorer than at least the portion of Germany to which I have alluded. To travel 100 miles in Ireland first class would cost 18*s.* 4*d.*, in Germany 12*s.* 6*d.*

1126. (*Lord Donoughmore.*) How do you obtain that figure, as the fares vary upon the different lines of railway ?—I am calculating a rate of $2\frac{2}{10}d.$ per mile, which I believe is about the rate in Ireland.

1127. That is the rate upon the Southern and Western, but upon some of the northern lines the rates are different ?—Yes, and to the west of Ireland the rates are still higher, I believe ; from Dublin to Galway the rate is, first class, 22*s.*, I think it is more than $2\frac{2}{10}d.$ But the second class in Germany, which is fully equal to the first class in Ireland, and almost beyond the first class in England, is only a penny, which would amount to only 8*s.* 4*d.* for the same distance. The third-class fare in Ireland is 8*s.* 4*d.* for that distance, whereas the third-class fare in Germany would be but 6*s.* 3*d.*, which class might be compared with the second class in Ireland. The fourth-class in Germany, with regard to the class of persons who travel, can be compared with the third-class in Ireland, and the fare would be 3*s.* $1\frac{1}{2}d.$ for 100 miles.

1128. (*Sir R. Hill.*) Are not the fourth-class carriages in Germany open carriages ?—Yes, some of them are open, but some of them are closed, they have hangings in cold weather, and the climate in winter is more severe than in Ireland.

1129. What kind of carriages are used in Ireland for that class ?—They have no fourth class there, I believe, except to the west.

1130. Then take the third-class passengers ?—The third-class carriages are mostly closed as far as I recollect.

1131. (*Capt. Galton.*) With regard to the rates charged for goods ; you have stated that the German Union of railways fix the rates for the goods ?—Yes.

1132. Do they permit the general managers of the different lines to give special rates to individuals ?—No ; everything there is done bureaucratically.

1133. Is everything published, so that any person can ascertain the tariff at which he can send goods, either per train load, or per waggon load, or per ton ?—Always, all that information is to be obtained.

1134. You have no doubt that it does not rest with the general managers to fix the rates ?—No ; but I think they have made a great mistake as to the inflexibility of their rates ; for variable rates, in order to carry on railway traffic properly, are almost a necessity of the system as it appears to me.

1135. (*Lord Stanley.*) Will you be good enough to explain that a little ?—They made an arbitrary rule, to come back to the question of coal, to make a certain charge per mile and two terminals, but it was very soon found that if they adhered to the terminals they would shut out from themselves and the coal owners a very large trade to Bremen, to Hamburg, and to Berlin, in which places the competition of England was considerable. Therefore, after a great deal of consideration, the German Union itself of that system of railways resolved, upon the representations made by the coal owners, to reduce the rate, and they did so accordingly. I could perhaps illustrate the facts better by referring to a very interesting map which has been made by the Prussian Government, showing the production, consumption, and circulation of the various fuels in Prussia. The dark squares upon the map represent the quantities and places and quantity of production of the coal. The map was made very much upon my suggestion to the minister to show how a reduction of the rates would lead to an extension of the trade. Before the year 1860 none of the Westphalian coal reached Magdeburg, but in consequence of the reduction that was made in the rate, it has now reached it, and much further (*explaining the map to the Commissioners*).

1136. (*Capt. Galton.*) Does the Government fix the rate ?—Upon any of the railways in which they have an interest they approve of the rates which are charged, for instance upon the Cologne and Minden railway.

1137. Where they have no interest in the railway do they interfere ?—No, they cannot interfere directly.

1138. They do not interfere any more than they do in England ?—They do not.

1139. (*Chairman.*) You have not given a full answer to the question put to you by Lord Stanley as to the reason why you objected to fixed rates ?—I have put the map before the Commissioners in order to show that the coal owners could not have sent, and the railway companies could not have carried, coal in any large quantities to Bremen and Hamburg were it not (with regard to those ports where competition was to take place, with England, for instance,) that a reduction to those places took place for that purpose by taking off the terminal charge of 3*s.* per waggon load in order to enable it to be done. The railway companies themselves were convinced of the necessity for it and they abandoned it, and in the same way they did so at Berlin.

1140. Has there been any agitation in the intermediate towns with respect to a reduction in the terminal charges in consequence of their having been taken off in Berlin and in Hamburg ?—Yes, and it is a constant subject of agitation. The principle of the thing seems not to be justified at all ; I mean making these terminal charges where such an article as coal is loaded by the producers and is unloaded by the consumers without cost to the railway company.

1141. (*Lord Donoughmore.*) If a large quantity of coals is to be unloaded at a station, must not the company who are the owners of that station provide sidings for the purpose ?—They should do so, and they have found it to be their interest to do so, and they have extended the stations very considerably. In Hanover it is a subject which is constantly brought before the Parliament to grant additional sums of money to increase the stations in consequence of the new increase of trade which has come to the railways from these very coal trains which I have already mentioned.

1142. Does it not appear just and reasonable that the company which provides the siding accommoda-

tion should receive something beyond mere mileage rate for conveying the coal?—It was upon that ground that the terminal was proposed to cover the expense of keeping books and so forth; but these sidings, we contend, are for the benefit of the railway company, because they bring to the company trade which they would not have, if they did not provide that accommodation.

1143. Take the case of two railway companies; one of them carries the coal, say for 10 German miles, the coal then passes off that line on to the line of the next company, who also carry it for 10 German miles. The coal is then discharged at a station belonging to the second company, at which station the second company must have provided siding accommodation. In that case would it not be fair that the second company should receive something more than half the total charge for the carriage of the coal, the siding having been provided at their cost?—Yes, in the abstract it appears to be so, but when you recollect that the other railway company has also its stations at which coals, I may almost say certainly stop, and they have similar things to take into account, it equalizes itself, I think, all over the system; they obtain the advantages resulting from encouraging the trade and bringing into use the first necessity for manufactures; the collateral and indirect advantages have been generally found by liberal minded thinkers upon the subject, to balance any of the little questions of debtor and creditor account at the commencement of the trade arising from these causes.

1144. I will suppose that a train of coals is carried for a certain distance over different railways, and the distance so carried over I will divide into three equal parts. Suppose that each of those three parts belongs to a separate company, that the coals are loaded at the station of one company and pass along the line on to the line of another company without being unloaded, and that they are discharged at a station belonging to a third company. Would it not be fair that the companies which have provided accommodation for loading and unloading should receive more than the intermediate company which had not, and would it not be manifestly unjust to give a full third to the company which had incurred no expense for the loading and the unloading?—Clearly in the particular case that is put, but I believe that most of the large railway companies in London provide vast accommodation for the coals, even storage room and so forth, at very moderate rates indeed, whereas the German railway companies which I have spoken of provided nothing but a siding. Following the advice that I gave to the railway directors in Hanover, founded upon the example which is furnished by the railway companies in London, they have had a harbour constructed, and they have provided means for delivering the coals off the railway into the ships, feeling that thereby they brought new traffic over their system which otherwise would not have come.

1145. (*Mr. Glyn.*) As I understand you they do not stack the coals upon the railway stations at all?—As little as possible.

1146. Do they do so sometimes?—Yes. The railway companies let to the coal owners a place for their accommodation.

1147. For which they have to pay a rent, I suppose?—Yes; the charge is not included in the terminals I have been speaking of.

1148. (*Sir Rowland Hill.*) You have compared the fares charged on the German railways with the fares charged on the Irish railways. Can you say anything as to the comparative speed of the trains in Germany and in Ireland, referring now to the passenger trains?—I cannot speak exactly to that point, but from the experience I have had in travelling I think there is very little difference between them; the quick trains in Germany are very good indeed.

1149. Are they so quick as the quick trains in Ireland?—I should think there is very little difference between them; it is something like 35 miles an hour, I think, and by the courier trains in Germany the accommodation is unquestionably better.

1150. Is the speed in Germany equal to the speed in Ireland?—I cannot say, but I may say this, that whilst the Irish railways are so depressed, many other railways in Germany, besides the Cologne and Minden, are also paying very large dividends, and some of them along this very North German Union to which I have referred.

1151. (*Chairman.*) Is there any competition between the different systems in Germany?—Competition is by law prohibited in Prussia, but they are feeling the error of their ways, and with reference to that the government itself is at the present time very liberal minded. Statesmen in Germany, who take large views of the subject, are disposed to do away with the law which prohibits competition, and in Prussia the government itself are absolutely changing the law and promoting lines in order to produce competition.

1152. (*Lord Stanley.*) In what manner can competition be prohibited by law?—By an express enactment in the original law on the subject, whereby a line cannot be conceded by the minister which should be deemed to be a competitive line. They wish to reform the law in that respect.

1153. Then the laws have guaranteed to railway companies a monopoly of a certain district?—So far as the question of what is a competing line goes, but there have been found openings for evasion, for instance if a line does not go from end point to end point of its competition, it is tried to be evaded. The Government think that it is wrong, and they are promoting state lines, and they wish to have the law changed; they are also promoting canals for the purpose of making a reduction in the rates charged.

1154. (*Lord Donoughmore.*) They are promoting state lines in competition with lines which have been made at the expense of private companies?—Yes, they are, for instance the Bergish Markish Railway; and with the full consent of all parties in Parliament who see that there has been a palpable error committed, and that competition is the sole means of keeping down the rates. The Germans are now pretty well convinced that low rates will produce high dividends, and that they have committed an error in limiting the dividends to a certain figure and then reducing the rates for the purpose of keeping the dividend down. That is a matter which is better understood at present.

1155. (*Lord Stanley.*) If a line of railway has been made upon an understanding with the Government that the promoters of the line shall have a monopoly of a certain district, how can the Government break through that understanding without incurring the reproach of committing a breach of faith, or making in some form or other compensation to the railway company whose privilege they take away?—They seek to make compensation in some other form by conceding to them certain privileges which they had not before. The Commission are aware that legislation in Prussia is totally different from legislation in this country, and this is a subject to which I meant to advert; for instance the preliminary expenses attendant upon the passing of a railway bill, or rather obtaining a concession, there are very low indeed. I believe I am right in saying that the various expenses of one class and another accompanying the passing of railway bills in this country before a sod was dug would amount to something very nearly like the cost of the whole of the Prussian railway system.

1156. (*Mr. Hamilton.*) With what department does it rest to authorize the construction of a railway in Prussia?—It rests with the Minister of Commerce and Public Works I believe.

1157. Then the restrictive Act to which you have alluded would be an Act restricting his discretion?—Precisely, as I understand the case.

1158. (*Mr. Horsfall.*) Is not the guarantee you have spoken of as being given to certain railway com-

Mr. W. T. Mulvaney.

5th May 1865.

panies limited to a certain term of years ?—I cannot speak with certainty upon that, but it is generally so. A concession is generally limited to 50 years with the power of increasing its duration upon the application of the whole company, and with the sanction of the State.

1159. The question is, whether these concessions are not made to certain railway companies upon the understanding that after the termination of a certain period, say 15 or 20 years, the Government shall have power to take possession of the railway ?—That is only in the case where the Government has given a subvention at the commencement. I know that that exists in the case of the Cologne and Minden railway. I believe that it does not exist in the case of the Rhenish railway, nor in the case of various other private companies.

1160. Is it not also the case in France that the Government has power to take possession of a railway after a certain term ?—I am not aware.

1161. (*Mr. Glyn.*) You have alluded to the large dividend which some of the companies in Germany are paying ?—Yes.

1162. I suppose that in those cases the capital of the company is based upon the same principle as that to which you have alluded before—there being a very small real capital, the rest of the money having been borrowed ?—I will give you the facts. I have already quoted the Cologne and Minden Railway. The Rhenish Railway, with a capital of 6½ millions, has only three millions of original shares. It is 227 miles long, and it has cost 21,749*l.* a mile. That company paid in 1863 six per cent.

1163. Do you mean upon its own capital ?—Yes ; after paying off all the interest and the sinking funds and its loan charges for the year. The Bergish Markish Railway, which is under the management of the Government, and which I believe was originally a private company, has cost four millions of money, and it has 1,900,000*l.* of original share capital. It is 158 miles long, it cost 22,000*l.* per English mile, and it has paid 6½ per cent., or it did so in 1863. The Berlin and Potsdam Railway, from the Elbe to Berlin, cost 2,200,000*l.*, it has only 750,000*l.* of share capital, it cost 22,484*l.* a mile, and it paid 14 per cent. in 1863.

1164. (*Sir Rowland Hill.*) Is not the same principle adopted by many, if not by most, of the English railways—paying up a certain amount of capital and then borrowing what may be wanted beyond that ?—The proportion in Ireland is a very much smaller proportion of loans. I believe it is from a third to a half. I believe it does not exceed one third. I may mention one more—the Magdeburg and Halbertstadt Railway cost 735,000*l.* and the share capital amounted to 255,000*l.* ; it cost 13,360*l.* a mile, and they have paid 22⅜ per cent.

1165. (*Chairman.*) Has the Government in all cases a voice in settling the tariff on the Prussian railways ?—Only on those which are under the Government control, or receiving Government loans.

1166. Are the other railway companies at perfect liberty to charge what they like, and is there no restriction ?—I am not aware.

1167. (*Mr. Glyn.*) Is there no fixed tariff ?—Yes. A tariff is published by every railway company.

1168. Is it fixed by the same body ?—I think I had better not answer that question, for I might mislead the Commission. I will ascertain how that is; it is probably defined in the original concession.

1169. (*Mr. Gower.*) On the Government lines do they in practice interfere as to fixing the rates, or do they leave that to the discretion of the managers of the railways ?—The Government departments manage everything themselves. Everything must be approved, every stage of it, every change of any kind that is made as to rates, or putting on trains, and so forth, must be approved, of course on the suggestions of the local managers.

1170. Are they supposed to fix the rates with reference to the interests of the public, or with reference to the interests of the railway companies ?—The principle propounded by almost all the various States which I have visited—Hanover, Brunswick, and Bavaria—is to fix the rates more with reference to the interests of the public, keeping their interests in view, than the interests of the railway company ; but then, taking Brunswick, for instance, and Hanover too, the gentlemen who are at the heads of those departments have been there from the very commencement, and are very clever men, and the chairmen of the Government Boards, and they have devoted in those two cases the most enthusiastic attention to the subject, and generally their representations are accepted by the Government of the State. In Prussia everything is submitted with the greatest formality, and it has to go through all the stages that it is possible to pass through before anything is done.

1171. In your efforts to persuade the Governments that a reduction of the rates would be beneficial, did you not put forward, as a chief inducement, that it would be profitable to the railway companies themselves ?—I put forward a double inducement that it was essential, in order to raise the interests of the trade of the country, that it was the very lever by which the whole trade of the country could be raised, and that it would, instead of being an injury, absolutely be a profit to the railway companies. I wrote in those terms, and I laid particular stress upon my opinion that it was essentially the duty of the Government to set the example on the State lines.

1172. Was it not part of your case that it would be no loss to the railway companies ?—Certainly. I showed that the cost was about a farthing a ton per mile, while they would receive nearly a halfpenny, and therefore that it would be a profitable concern ; that if the mass of the business done was large it would justify their putting on additional rolling stock, and it has turned out to be so.

1173. Do you think that they would have sanctioned it if it had been a loss to the railway companies ?—No.

1174. You do not think that they would have sanctioned it if it had not been for benefit of the companies ?—I do not think that the department would have felt justified in doing so.

1175. (*Chairman.*) Are you of opinion that the Irish railways could be managed more advantageously for the country than they are ?—The management seems to me to be an exceedingly difficult question. I believe that competition is essential to success in almost all great commercial matters, I believe that it is totally foreign to the office of the Government to manage railways, and I say so, because I have spent the greater part of my life in the Government service. I think it is peculiarly so in this country and with our constitution. It succeeds in some of the districts of Germany tolerably well. In Hanover nearly all the railways belong to the State, and in Brunswick it is so also ; but then, as I have already stated, there are men there who are really masters of the position in each of those cases, and who have been there since the birth of the system, and who carry it out with the zeal of originators, but the difficulties which arise from delays before anything can be done are excessive. With regard to Ireland the consolidation of the management, as it has been pressed upon me by some friends of mine, and putting the whole of the system of Irish railways under one management, however tempting, I fear would only lead to a monopoly, whilst at the same time the present state of affairs there is greatly to be deprecated. The railways are not joined together, and they have remained in that unconnected state for very many years. Of the railway systems which come into Dublin none of them go down to the harbour ; they approach it, but they are not connected with the harbour or the shipping. The Midland Railway within the last two years has done what was proposed to be done very nearly 18 years ago, namely, to connect itself with the harbour, and that is the only exception, the difficulty of passing from one system to another still re-

mains. The northern system is in a great number of hands, and I have no doubt that that creates many difficulties in the management. The late manager of the Midland system has explained to me that goods passing through the centre of Ireland owing to the want of meeting trains, say, from Cork to Belfast will take very nearly a week, in the ordinary course of things, from various stoppages and delays which occur, whereas we know that if a suitable connexion were made—for instance in Dublin—they might go through in ten hours.

1176. What is your view as to what ought to be done in the case of the Irish railways?—I confess that I am greatly at a loss to know. I cannot reconcile to my mind the principle of the Government managing such things, and the question is, what can be done. Unquestionably, if capitalists in this country were to take up the whole system, and to reduce the rates —for I look upon a reduction of the rates to one half as essential—it would lead immediately to a loss, and they would not recover from it for two, three, or perhaps, four years. Then we come to the development of traffic, and that has been hitherto, I may almost say, prevented. But, if the difficulty of that period of loss could be got over, I would still say that the system of management by the companies, keeping up the separate interests by competition, would be the best, if a control could be got over them, to induce them to carry out a reduction of the rates. If, however, they cannot be convinced, like the Germans, and persuaded to reduce them voluntarily, then the question will remain, for the interests of the country, whether those gentlemen can be met in anything like the way in which we, the coal owners in Germany, met the railway companies, by giving them a guarantee during the time of the experiment.

1177. Do you believe that a great deal of traffic might be developed in Ireland which has now no existence if it could be carried on at much lower rates?—I am convinced of it; but I do not take the exaggerated view that many persons do upon this subject, and who seem to think that people will travel who have no business to travel; for instance, I do not believe that to run trains from London to Ramsgate in the winter season, at low rates, would induce passengers to go as they do in the summer time, or that it would fill the trains. People would not go even from London, and *à fortiori* they would not go in the agricultural districts of Ireland. But I believe that a reduction in the rates to something like the German standard would unquestionably develop, both in passengers and in goods, but still more in goods, a very large traffic. I believe that the goods traffic in Ireland is very small indeed, in comparison with what it ought to be, and would be. Upon most well developed systems of railways, the income from the goods traffic greatly exceeds that which is obtained from the passenger traffic; but taking the great systems in Ireland, the Great Southern and Western, and the Midland (until the last two years), and the Northern, when they approached Dublin there was a break in the communication for goods, and there was cartage through the City of Dublin, and all those difficulties, which no doubt had the effect of preventing a large or increasing goods traffic. I have found it to be the same in Bremen, Hamburg, and Rotterdam, and other places, with the coal traffic, that unless we went alongside the ship, and discharged the coals out of the railway waggon into the ship, it was quite enough to cause us to lose the markets we sought to open.

1178. (*Mr. Glyn.*) You have given, as an illustration, goods sent from Cork to Belfast, and you state that there was great delay; does that delay chiefly arise from the want of local accommodation as between the different railways, or from a want of harmony and system between the respective boards?—I believe that it does not arise from a want of harmony, but, as I understand it, it arises from this:—that, upon each little branch upon which a waggon may come, it must remain until the next train arrives which is going in the direction required, so that in that way a waggon sleeps, as I may say, many nights at various stations along the way before it reaches its destination.

1179. Does not that show a want of concert between the respective boards?—If there is not a through traffic organized to enable them to send on trains, that might account for it.

1180. Would not that be remedied by making proper through traffic arrangements?—Then there must be a sufficient traffic to justify the owners of the little branches to put on a train for that express place; for example, if it were desired to send a waggon, or two, laden with flax goods to the north of Ireland from the south, to be manufactured, say in Belfast, unless they could make up a train-load there would be a difficulty in a quick transit by cross lines, whilst, if the main trunks were joined in Dublin, these two waggons could run through with the ordinary trains.

1181. Would not the object be attained if the trains of all the companies were allowed, as a matter of course, to run over that small railway?—Clearly; running powers ought to be given.

1182. Would not that considerably tend to cure the evil?—Yes; if the traffic was there, but I am not aware that it is there. I do not believe it is developed.

1183. (*Lord Donoughmore.*) The illustration that you have given refers to goods being brought to Dublin by railway, but have they not an additional difficulty to contend with, viz., the competition by sea?—As far as my experience has gone there is nothing to be feared from that. Take the coal traffic from the north to London, the railway competes with the sea; and the traffic from the north to London by railway has slightly, as far as my experience has gone, increased on the railways, and is decreasing in the shipping. I believe that most classes of goods and particularly the low priced goods, will not bear the cost of transshipment and cartage, say to the ship in Cork, and again taking them out of the ship at Cork, and then cartage again to the store in Belfast. If a waggon, as a principle, can run from the producer to the consumer, that will put down every competition.

1184. (*Mr. Glyn.*) What is the rate per mile for the carriage of coals in Ireland?—As far as I have been informed, the rates for coal in Ireland are about a penny per ton; ¾ths of a penny is the lowest I have heard of.

1185. (*Chairman.*) Is that nearly about the rate charged on all the lines?—I am told so.

1186. (*Mr. Glyn.*) Do the companies find the waggons, or do the owners find them?—There are no private owners of waggons in Ireland, I believe.

1187. (*Lord Stanley.*) You are of opinion that if the railway fares in Ireland were generally reduced to the extent of something like one-third of what they are now, the success of the experiment, after a certain number of years, would be certain; but that a loss during that time would be equally certain?—Yes.

1188. Who will have to make up that loss?—It is perfectly certain that there would be a loss in Ireland, and that the recovery of it would be slow; but I believe it would be perfectly certain. The doctrine propounded by some of the chairmen of the railway systems in Ireland, was, that there existed only a limited supply, and that it was useless to suppose that that supply would be increased. I believe that that is a complete begging of the question; but I heard the same arguments constantly used when we first commenced our attempts in procuring reduction in the rates in Germany. The parties are now convinced that production has gone on step by step with the facilities which have been afforded for transport.

1189. (*Lord Donoughmore.*) You stated, I think, that the district with which you are connected in Prussia is a vast coal field, and that it has enormous capabilities of production, which are not yet developed?—Yes.

1190. I wish you to compare the chances of traffic in Ireland, which as you are aware, is not a coal producing country, with the chances of increased traffic

Mr. W. T. Mulvaney.

5th May 1865.

from the lines of railway running through Westphalia; and do you think it is reasonable to hope, supposing that the rates for the carriage of goods in Ireland were reduced, that there will be such an increase of the traffic in Ireland as in Westphalia?—No, I do not believe, without reference to the matters which I have alluded to in my evidence, that Ireland would produce it, but I may say that I look to the introduction of coal into Ireland as the lever and the means of improving that country, coupled with low rates for the transport of goods, beyond anything else; and I propose to show that it is practicable. Dublin is at present the very centre of the various railway systems in Ireland, it has been so for a long time, and when I was in office, it was an object of interest to me to draw attention to the necessity of forming connexions between the various railways in that country and the ports of Dublin and Kingstown. After many years this was not carried out, but recently an Act has been passed through Parliament for the purpose of effecting this connexion. I was consulted upon it at a very early stage, they sent out to me in Prussia the designs. I advocated the matter, and encouraged it in every way, but I suggested that special reference ought to be had to the development of the coal trade, and the importance of certain docks, called the Grand Canal Docks, whereby a branch being laid down to them, a through system of communication, which is so successful here, for example, at the Victoria docks, might, with the greatest facility, be established there. As far as my experience has gone on the Continent, and everywhere else, I have seen no manufactories, nor any great industry successful, where there has not been a regular supply of coal, even where there has been water power, wood, and turf in abundance. I believe that it would be quite practicable to deliver coals in the interior of Ireland 100 miles from Dublin, at a cost varying from 14*s.* to 16*s.* a ton, and to have it regularly supplied there, so that manufacturers and other persons requiring it should feel satisfied that they would be quite safe and secure in commencing operations there. That is only to be accomplished by bringing coal in vessels, or I will say steamers, from the English coast, right alongside the railway in the harbour; for the present moment, I will say in Dublin, which is the centre of the railway system. There it could be unloaded from an 800 ton ship, or a 600 ton ship or steamer. She could come in, if suitable arrangements were made, and discharge her coals in a space of twelve or fourteen hours into railway trucks, and the railway trucks could go off into the interior of the country, to the places of consumption. I am assuming that the coal would be put on board the vessel on the coast of England, it is done frequently at Newcastle, and places thereabouts, for 6*s.* a ton, and I take it that about 4*s.* a ton, on a large trade, would pay for the carriage of it, assuming that suitable arrangements were made to carry the trade on, and that the railway companies would deal with the matter in hundreds of thousands of tons, and that the same company would provide depôts at the various internal stations of Ireland (as the advantages of the system developed themselves), and in the places in which it might be necessary to furnish coal. The coal would then be carried at the same rate as in England and in Germany, and in waggons going from the harbour to the interior of the country. It could be carried 100 miles for 4*s.* 2*d*, which added to 4*s.* would make 8*s.* 2*d.*, and 6*s.* would make 14*s.* 2*d.*, then adding 1*s.* for unloading, 15*s.* 2*d.* would be the cost of the coal carried to a distance of 100 miles from Dublin. I have a very strong belief that that is practicable, and a proposition has been already made for the purpose arising from my suggestion. I have conversed with an engineer in London, Mr. Mallet, who is well acquainted with the metallurgical productions of Ireland, and a proposition has been made for the purpose of utilizing the docks to which I have referred. I believe that a very important return trade is to be had from Ireland. To my knowledge there are numerous ores in Ireland which lie and must lie perfectly useless unless either coal is taken to them or they are brought to the coal, the former being the most natural and certain course. The same railway truck that would take the coal into the interior of the country could bring back not only those ores, but many other raw products, such as marble and fine earths, pottery earths, and so forth, and various other articles of a very cheap class. They could bring them back with advantage at half the price that the coal was carried at, and those same train loads might be put into the coal ships and returned to England (supposing that the arrangements were completed, it would of course take some years before that would be the case), but in that way the coal ships would be able to go back in a second or third tide, and sail away from the harbour to the English coast. In this way the railways would carry the fuel into the remotest parts of Ireland at the cheapest rate, affording a means for the steady development of the industry of all classes. There is a great want of railway facilities in this respect. For instance, Ireland produces a large quantity of wool, and it all comes away, I believe, in a raw state to be manufactured; it is not manufactured there. Although water-power is cheap, yet it does not appear in the end to be adopted, and in fact the result of any observations which I have been able to make in other parts of the world has been this, that manufactures themselves do not thrive without the assistance of the coal, regularly and cheaply supplied. I believe that coal would in this way be in many parts of Ireland as cheap as in many parts of England.

1191. (*Lord Stanley.*) You are probably aware that there has been a great increase in the consumption of coal, especially in the southern parts of Ireland?—Yes; since the establishment on a similar principle to that I speak of by a gentleman at Cork, who is a large shareholder in the Dutch-Rhenish railway, and who has been introducing coal into Cork as I understand, and into the interior, is sending it by railway.

1192. (*Mr. Hamilton.*) I suppose that even if lower rates had not the effect of introducing manufactures, which you seem to be sanguine about, into Ireland, you would have no doubt that those lower rates would materially develop the resources of Ireland in every way?—Unquestionably that would be so. I have alluded to the development of manufactures, mainly by the introduction of coal; but a reduction of the rates for travelling, and for the carriage of agricultural produce, for instance, from the purely agricultural districts, like the western parts of Ireland, and some of the southern parts would be most beneficial. I may ask what can be more absurd than the idea, for instance, as I find is the case, that a penny per ton per mile is charged for the carriage of dung, as it is reported to be in Ireland. They charge such high rates there, that there can be little or no traffic, for one would scarcely think of loading such articles at such rates.

1193. On what railways in Ireland is that rate charged?—I understood it to be the general rate; I had that from Mr. Forbes.

1194. Can you compare that with the rate charged on the English railways?—No; I cannot.

1195. (*Chairman.*) You think that the traffic might be greatly increased in Ireland by charging low rates for the carriage of purely agricultural produce?—Yes; I think that the mission of railways is to diffuse the benefits which they are capable of conferring equally from the manufacturing into the agricultural districts, and to raise the character of the whole in Ireland, and it is particularly practicable to do so in Ireland, because the island after all is small, and the railways in the greater part go through agricultural districts. At their termini they are generally connected with harbours on the sea coast, and other places, from which traffic may be developed. I have heard facts stated, connected for instance with potatoes, which are produced on the coast of

Galway, and are brought all round a dangerous coast to Dublin, in consequence of the high rates charged by the railway companies, which prevent them from being sent across the country. I may mention that in Germany lately a project has been started, which has been partly carried out, to carry corn, wheat, &c. from Hungary, and take it the whole way to the coast opposite to England, running down through the whole of the Continent, in preference to sending it to Trieste, to come round by sea, it being carried at the favoured rate which we have introduced, one pfennig per centner a German mile; the railway companies agreeing to take it in full railway trains. In the late difficulties, about a year ago, in Prussia, the Government did interfere about rates, and from the eastern or agricultural provinces of Prussia, partly by its influence, and partly from the position of those provinces, the railway companies were induced to carry potatoes, corn, and agricultural produce from those agricultural districts into the manufacturing districts of Westphalia and the Rhine at very low rates similar to the coal rates, but attaching the same condition that they did in our case, that the train should be full, and should run through.

1196. (*Capt. Galton.*) That is to say, full train loads?—Yes.

1197. (*Mr. Glyn.*) Are they acting upon that full train system upon the French coast with regard to the produce sent from Hungary?—I am not aware whether it is now in operation.

1198. (*Chairman.*) From your knowledge of Ireland, do you believe that there are numerous resources in that country undeveloped?—I am perfectly sure that there are.

1199. Are there any ores which are sufficiently rich to pay for working them at present?—Yes, quite rich enough to pay for working, if they are only brought to the coal, or the coal is taken to them. I have referred to Mr. Mallet, who is a metallurgist, and is thoroughly acquainted with the mineral wealth of Ireland, and which are the positions where it is best available to be developed by railways. I have myself seen quantities of minerals lying about in Galway, which have been brought down to the harbour, but which could not be sent away on account of the expensive carriage; and in many other districts iron ore is very abundant and of a superior quality, but there it lies.

1200. (*Lord Donoughmore.*) There is coal there too, is there not?—Yes; but unfortunately it is not as free to work as our coal is in Prussia, and it is often embarrassed with some difficulty as to the title.

1201. You are so familiar with Ireland that I need scarcely remind you of the Kilkenny and Tipperary coal districts; you are aware of them?—Yes.

1202. Is it not an extraordinary fact that, although those mines have been worked for many years, no railway company has ever thought it worth its while to run a branch into either of those districts?—Yes; but I assume that the coal could not be obtained in sufficient quantities to pay, by its transit over the line, the interest upon the money expended. I know that the coal is of the anthracite kind, and that it is difficult to get out cheaply in large quantities.

1203. The beds, I believe, are not thick?—No; I believe that, at the present time, the whole of the collieries in Ireland do not produce so much coal as one of our collieries does in Germany, which I have worked myself. But I do not assume from that, that they could not produce vastly more than they do, and the first essential is what you have referred to, a connexion with a railway. Without that connexion—without the waggon goes to the coal pit—it is impossible to send coal to any distance at a cheap rate. Coal is a very low priced article, and it must be so; therefore it will not bear the cost of transhipment except where it is taken in large quantities, and on a well organized system, as I propose to send coal to the centre of Ireland itself.

1204. If it is not worth while to make branch railways to develop the Irish coal trade, what reasonable ground is there for hoping that a reduction of the rate for the carriage of coals would very much increase the English coal trade?—Because that English coal trade is already developed; you can have any quantities that you wish to have from England over to Dublin. Ireland imports at the present time about two millions of tons, and I understand that about 600,000 tons of the gross quantity go into Dublin, and this, without any connexion of the railways with the harbour, or with each other at Dublin, so as to facilitate the passage of this cheap article throughout the country. If, then, you can go and buy coals largely on the coast of Whitehaven and Lancashire, the coal owners will deliver their coals into the ships at the average price which I have stated. I do not mean all screened coals, but I mean the coals that come from the pits, for the Irish could consume the slack as well as the large coal, at anything like 6*s.*, and if you deal with hundreds of thousands of tons, I believe there is no question that that coal would be taken cheaper into Kilkenny than you would get the Kilkenny coal for. I have been making arrangements to run coals to Paris from Westphalia through the middle of the Belgian coal field, and I can do it to-morrow with the same advantage to myself as to Berlin, if one link in a branch of the railways will agree to the same rate for the through trains.

1205. (*Capt. Galton.*) At what rate?—At less than a halfpenny a ton per mile.

1206. (*Chairman.*) Can you raise coal in Prussia better than they can in the Belgian coal fields?—Yes, our coal beds are from 4 to 6 and 7 and 8 feet thick, whereas the coal beds in Belgium are by no means so thick, they are not more than three feet thick. In addition to which, they have combinations amongst the coal owners, (which practice, however, no doubt will find its level,) by which they keep up the price of coal in Belgium.

1207. (*Sir Rowland Hill.*) Are the wants of Ireland, in respect to coal, now supplied in abundance at Belfast, Cork, or Dublin?—At Cork I am told that it is increasing very much. I understand that they have made arrangements for effecting a communication between the railway and the harbour.

1208. Is coal cheap in the different ports of Ireland?—In the eastern ports it generally is.

1209. Cheap and abundant?—It is very irregular. In Dublin the supply is very irregular, the coals running up to a very high price if there is stormy weather, for instance, because Dublin is supplied by small sailing colliers that come into the port and there sell their coals in bags out of the holds of the vessels, which is taken away in carts, but there is no organized coal trade there except supplies for gas works, &c.

1210. Is it used in any of the ports largely for the purposes of manufactures?—Very largely for the manufacture of gas, and for any manufactures that may exist; in Belfast, for instance, it is used extensively for manufactures.

1211. As I understood you, you expect that if communication with the interior parts of Ireland is made very cheap, coal will be very largely used for manufacturing purposes?—Yes, for private consumption and for manufactures.

1212. Of course the supply to the ports of Ireland is quite independent of the internal communications, and I should like to know whether the ports are now supplied cheaply and abundantly with coal, and whether it is in the ports or in the neighbourhood of the ports applied largely to manufacturing purposes?—It is so applied in the ports of Belfast, Dundalk, and Newry; and with regard to what manufactures there are in Dublin, what they want is a connexion between the ship and the rail, which I consider would originate a greatly increased demand, and almost a new trade.

1213. (*Capt. Galton.*) At the present time, there are no facilities for unloading coal in a cheap manner from the ships in any of those ports?—I will not

Mr. W. T. Mulvaney.

5th May 1865.

say, in any of the ports. I have not been in Belfast for some years.

1214. (*Sir Rowland Hill.*) Can you explain why those facilities have not been afforded ?—That would be to explain an anomaly which exists, not only in Ireland, but in many other countries, which advance slowly. These facilities have only as yet been recently afforded in London, and they are not yet afforded to the fullest extent. You unloaded the coal up to a few years ago into barges, and brought it up the river, but now you have got an improved system at the Victoria Docks ; they have there erected hydraulic cranes, and they unload coal extensively, and put it into the railway trains, weighing the coal and discharging very large cargoes within the space of a day.

1215. All that is the result of private enterprise, is it not ?—I believe it is, and nothing else does in England. There is a very great want of enterprise in Ireland ; take, as an example, the question of the connexion of the railways. There is the Great Southern and Western ; the Midland Company are the first who have done anything, but the Great Southern and Western and the Drogheda lines come very near to the port, but not to it, and there they have remained for many years in the same state, the lines were constructed without giving that connexion, and when the matter was suggested to some of the parties, what they said was, "How can we do anything with it, we are only making a small rate of interest on our money ; instead of improving, everything in Ireland is going down, so that we had better let matters remain as they are." There is a want of enterprise ; but I should suppose that there is no want of capital if a right policy were adopted.

1216. (*Capt. Galton.*) Do you know the present price of coals at the stations in Ireland in the centre of the country or at Belfast ?—I do not ; but I have recently heard that in Kildare Mr. More O'Ferrall gets his coal at 14*s.* or 15*s.* a ton at a place not very far from Dublin.

1217. (*Lord Donoughmore.*) But that coal is taken by canal ?—Yes ; and there is Mr. Monsell also, who informed me, by shipping at a suitable season he had coal at a cheaper rate in the south-west.

1218. (*Capt. Galton.*) Do you know at what price coal is delivered in Limerick ?—No ; but I know that years ago it varied immensely in price.

1219. (*Chairman.*) Are you of opinion that the freights on railways ought to vary according to the time of the year ?—No. What I say is that you cannot make a rigid rule, and that to propose fixed rates as a rigid rule, per mile or per ton, is inconsistent with the very nature of the trade itself, because it must vary with the circumstances of the locality, and must vary even with the times and seasons. I illustrated that by referring to Ramsgate, which, in the summer season, will pay the railway company well with very low rates, but of course in the winter time no one will go there.

1220. Are you not in favour of imposing very strict restrictions on the liberty of railway companies as to fixing tolls ?—I should be disposed to fix a very much lower maximum than at present exists, but to allow the greatest possible liberty to railway companies to go below that maximum.

1221. If they reduced their maximum in certain cases, you would not allow them to reduce it in all ?—No. I believe that the management of railways is a profession, a science in itself, which requires the deepest study, great powers of combination, and a great knowledge of the country, and of the traffic to be carried,—and I do not believe it is wise to fix arbitrary rules, and to prevent that gradual development of knowledge that railways themselves at this time are only just unfolding. How far one may go in either a reduction or overcharge, in the rates of freight is the great question for the public. The passenger traffic, after it has reached to a certain amount, as far as I have observed in almost every country that I have visited, varies very little therefrom, whereas, on the other hand, as to the rates for the carriage of goods, of cattle, of agricultural produce and mineral produce, no one has, I verily believe, as yet arrived at the boundary to which one may go with profit to the railways by a reduction of the rates and affording facilities for carrying traffic through a country. I take it that the mission of railways is not merely to carry the traffic that exists in a country at the time they are formed, but to seek out and make new traffic altogether in the country as I have already pointed out that we did in the particular case I mentioned. Markets were only available by railway for 10 miles when we began, and we have made them available now, with enormous advantage to the railway companies, for nearly 100 German miles.

1222. You do not think there is much probability that the present railway companies in Ireland will fulfil that mission ?—I do not believe they will, they have not the courage, and, considering how they stand as to their shareholders, perhaps it is impossible to expect it. They see a certain loss before them, and they will not study nor consider the question of the future gain which they might make, and perhaps they cannot. Their argument is, we have here a certain traffic in the country,—that is what we have to carry,—and we must make the most out of that. I believe that to be a complete fallacy in railway management, and I believe it to be a begging of the question too ; and it has been proved elsewhere where a reduction of the rates has been steadily carried out for a sufficient time. They also say, and you will hear railway managers say it every day, that an article must come to a certain railway. We had the same difficulty to deal with in Germany ; they said, Our line is there, that article must come to it. But they made a very great mistake, because only so much of that article would go as could not help going—no increase of that article would go on it as long as the rate was nearly prohibitive or even discouraging.

1223. (*Lord Donoughmore.*) Are you aware that of late years the profits on Irish railways have gone on decreasing very much in the last year or two ?—Yes, and I attribute that to the fact of their absolutely driving traffic away from them.

1224. You think that they have starved the traffic by maintaining high rates ?—Clearly.

1225. You do not think that this depreciation is to be attributed to the emigration of the population, or to the sufferings of the agricultural classes in that country ?—The more the population has decreased of course the fewer they will have to carry ; but I think the error which has been committed by railway directors in Ireland has been in assuming too much that railways are constructed for passenger instead of for goods traffic, for the goods traffic would serve more to develop, at low rates, the resources of the country and to pay railway companies than the passenger traffic. The German labourer gets about from 1*s.* 4*d.* to 1*s.* 6*d.* a day, and the Irish labourer does not get 1*s.*, I dare say that is the case in the western districts even now. Formerly it was not more than 6*d.*, and in Germany you see the labourers travelling by railways. You see the German women coming in with their large baskets of vegetables or fruit a distance of 10 or 15 miles into a market town at a cost of 3-8ths of a penny per mile, and they make their marketing before 12 o'clock in the day, and go away in crowds. That is not so in Ireland, except in the neighbourhood of Belfast, where it does partly exist. The third-class passengers in Ireland are charged the same fare as the rich part of the people are charged in Germany who travel in upholstered second-class carriages, and the anomaly to any one who frequently visits both countries is so striking as to remove every shadow of doubt as to the impropriety of the rates which exist in Ireland, and the want of accommodation, especially for the poorer classes. I have here facts to show how much the third and fourth class passengers pay in Germany in comparison with the first.

1226. (*Lord Stanley.*) How do you propose to get over this difficulty, that there must inevitably be at first

considerable temporary loss, and that that temporary loss will have to be borne by the shareholders, many of whom have not, and do not intend to retain any permanent interest in the railways, who buy one day and sell the next?—I can see no remedy but an analogous one, just to compare great things with small, to that which we have done in the coal agitation in Germany, to guarantee the railway companies against the loss.

1227. But who do you propose should do that?—I do not think it is practicable in Ireland for any one but the Government or the public, but I think it would be just as to the public.

1228. It is the case of Ireland with which we are now dealing, and what can you suggest that would meet the case?—I think it would be desirable to run the risk of guaranteeing the loss, provided the Government took care to control the carrying out of the experiment.

1229. How do you propose, inasmuch as the loss for a certain number of years will be a certainty, that the Government should recover that which they would sacrifice, for I do not suppose you intend that the Government should grant a subsidy to Irish trade in the form of a guarantee upon which there must be a loss?—I am afraid it would end in their doing so, but I cannot reconcile with any system of sound policy the Government retaining the railways after they had yielded more than a given per-centage in order to recoup the public. If a private company or great capitalist could undertake the management of affairs in Ireland and carry them out firmly, I believe it would pay them right well to lease all the railways in Ireland for 10 or 15 years, and to make experiments in reducing the rates; but I dread the monopoly that would arise from that private company being in sole possession, for they would still be a company with their naturally monopolizing tendencies, and they would probably allow certain lines to get out of repair, and not keep others up.

1230. (*Capt. Galton.*) Why should they let certain lines get out of repair?—Because they could work the traffic cheaper over the others, but in that way the benefits of competition would be lost to the public.

1231. (*Lord Stanley.*) What I understand you to suggest is this, that the Government for a certain number of years, as many as might be necessary, should vote out of the taxes of the United Kingdom what would in effect be a subsidy for Irish trade?—I see no other means of compelling the railway companies to reduce their rates, for they are not open to conviction, and if they were, their shareholders would not allow them to do so for an experiment, otherwise I am totally opposed to the principle that the Government should do so, and there is but one justification of it, which is, that the whole system has been forced upon Ireland by the Government. When the first Railway Commission was brought forward, the late Sir Robert Peel, I remember at the time very well, contended on very large, general, and sound principles, that it was private enterprise, and that private enterprise should be left to have its way, and it would rectify itself; but, unfortunately, the circumstances of Ireland were totally different from those of England. The railway directions that were formed started with tariffs and rates upon the principle of the whole English system, instead of starting with rates which were suited to the country, and I believe that those high rates have tended materially to increase from the very commencement the embarrassments arising out of the state of Ireland.

1232. (*Capt. Galton.*) In what way do you mean that it was forced upon Ireland by the Government?—Because the Government did not accede to the proposition of its own Commission, which was, to have the railways laid out, and executed, in the first instance, by the Government of that day.

1233. (*Lord Donoughmore.*) You have referred to Sir Richard Griffith's Commission, have you not?—No; it was Mr. Drummond's Commission. What I state is, that State management is wrong, or at least it is not the best—that private management is the best—and if I look at the peculiar case of Ireland, and see that the material development of that country is retarded and prevented by the want of a development of its internal resources by a cheap means of transport, which is the very lever by which the improvement of the country could be effected, one finds it difficult to suggest a remedy consistent with sound principle, when the railway companies themselves will not apply one.

1234. (*Lord Stanley.*) Suppose that the Irish railway companies were amalgamated to a certain extent, were in fewer hands and under at the most two or three separate directions, do you not think that a lower scale of fares might be introduced in this way by a gradual reduction first upon one part of an extended line and then upon another part of the line, so that the loss in each instance being spread over the whole line, would be comparatively small?—I do think that amalgamation might effect much, and I have got that down in my notes. My object in bringing before the Commission the question of the German Unions, was to show that many kinds of benefits are accomplished by the union of certain great districts, even though private companies remained in what were called unions of railways; the same idea struck me as to Ireland, that certain great districts of Ireland might be brought into unions, or the whole of them might be brought into a union. But your Lordship's question goes to the effect of consolidating various small companies in that union, and that is a different view of the question. If one could take the whole of the northern system and the whole of the western system, and the whole of the south-western system, and put them each into one company, I believe that that would be the nearest approach to accomplishing the object, and which, in so small a country as Ireland, would be the most suitable for management. It would thereby save expense in rolling stock, and would give facilities that would be of great importance, whilst it would enable the wealthy parts of a line to make up for the deficiencies that existed on the others.

1235. Suppose an arrangement of this kind, say that a company possesses 1,000 miles of railway, and suppose also, as you contend, that the reduction of the fares to one half or to one third would be ultimately profitable, although involving present loss, might you not accomplish the object gradually by lowering the fares upon 1/10th part of the line each year, so that the loss would not be so heavy at any one time as if the reduction had been made over the whole line?—I fear that a reduction on a certain part of a line would attain but little, and I believe that the experiment, whenever it is made in Ireland, should be made rather over the whole line, and if it is desirable to proceed progressively as to amount, I should advocate a reduction to a half, and not to a third at present. The same view would be carried out by making a reduction over the whole line, but not to the whole amount of half at once, although I think you will find that the most experienced railway managers would recommend a quick development of traffic, and in order to quicken the development of traffic and make a certainty of it at once, a reduction to the scale you mean to go to would be expedient, because that would at once give a certainty to every one living in the district. Many people would say, I will start my manufactures now, because I am sure of this state of things, and it will not be changed; whereas, if there was any uncertainty in the matter, a man would wait. I think that every day that this material and simple question as to Ireland is delayed, the chances of improvement in the country are delayed also; that is how it appears to me, quite independently of politics and mercantile vexed questions. I have followed the improvements going on in Ireland during the last few years, and it has always struck me that this is the great lever that is requisite in order to improve the state of that country.

Mr. W. T. Mulvaney.

5th May 1865.

1236. (*Capt. Galton.*) Has not the reduction in the rates on the German railways taken place chiefly in the case of new traffic; for instance, the traffic which they carry now at those low rates did not exist before, did it?—Yes, there were 200 collieries in the same district, but they could not get the material to or carried by the railways.

1237. (*Mr. Glyn.*) When you went to the German Unions you pointed out to them the certainty of increased traffic, and directly upon that they granted your application for a reduction of the rates?—I could not show them the certainty, as it was then problematical, and depended of course upon the consumption; but I showed them that if certain quantities were carried, if they began with one express train a week, for instance, that that train could go and the waggons return empty, without any back loading, for a farthing per ton per mile, and that during the time they would receive for that train a half-penny per ton per mile; we had to run a risk, and we had to guarantee to the North German Union their full rate for 25,000 tons to Magdeburg.

1238. They did not agree to decrease the rate until you had entered into that guarantee?—No.

1239. (*Mr. M'Clean.*) Did you find your own waggons?—No; the railway companies find them, and we have reduced it very much to that principle now, that the country that wants the coal sends its waggons into the coal-producing country.

1240. If the Government guaranteed the mortgage debt in Ireland so as to enable the companies to borrow money at a low rate, would they undertake to give a low maximum rate for the carriage of minerals?—I do not know how the circumstances stand as to the mortgage debt.

1241. (*Sir Rowland Hill.*) A large portion of the debt has already been advanced by the Government, has it not?—I do not know.

1242. (*Lord Stanley.*) Assuming, as you have done before, that upon a large reduction of the rates a temporary loss and an ultimate gain are equally certain, do you think that the railway companies would be justified in covering that temporary loss by a loan returnable by means of a sinking fund at the end of a few years, the proceeds from the line being applied to keep the returns up to the average at which they had been before?—With the strong convictions that I have as to the ultimate success of the measure I do not hesitate to say that they would be justified to carry out the policy boldly and efficiently. I believe that any railway company would be justified in taking a loan on the terms of repaying it out of future profits, and the profits to arise in the meantime while passing over the period of difficulty.

1243. Making up the deficit in their income by means of a loan?—Yes.

1244. Do you think that might be done without Government help, or Government interference?—Clearly, in the way of a common commercial transaction, but the difficulty that strikes me in the matter is this, how you are to enforce the carrying out of the system, for, of course, it would require a legislative enactment to oblige them to reduce the maximum rates.

1245. And a legislative enactment to authorize them to borrow for that purpose?—Yes, on the condition of their reducing their rates.

1246. Not compelling them?—No.

1247. (*Sir Rowland Hill.*) If the Government guaranteed the railway companies against the temporary loss arising from the diminished charges, would not that have the effect of neutralizing the efforts of the directors to cultivate the traffic for a considerable time?—I am precisely of that opinion, and I have noted that down, that they would go to sleep on the question, and therefore it is that one objects to the circumstance of the Government being the medium by which this should be carried out. But I think the question of the noble Lord would meet the difficulty by leaving it optional to the parties to borrow the money in the open market, in order that they might pass over the critical period.

1248. Should you be prepared to recommend in lieu of your own proposition a guarantee from the Government?—As I have already stated, I should feel the greatest difficulty in advocating any guarantee from the Government.

1249. (*Chairman.*) But you do not see anything else for it?—No, except the leasing or borrowing before referred to.

1250. Do you think that any effect might be produced by lowering the present rates to the extent of one-sixth, or one-fourth at a time?—I think not, after all the consideration that I have been able to give to the question that we have been dealing with. I think it would fail, and in fact it has been tried in a neighbouring union, it certainly has produced some effect, as it has brought some trade by a sort of half measure, but a half measure with such an object in view, I fear is not to be relied upon.

1251. (*Lord Donoughmore.*) I think you have said that on the German railways special or exceptional rates do not exist; that there is a general tariff settled and determined upon by the railway authorities, which tariff the officers of a company have no power to depart from?—None; that is the general principle, there are special rates for Government purposes and special rates for their own service; but for the public in general, everything is fixed and published.

1252. The officers of the company cannot depart from that tariff?—No, speaking of Germany; but in Holland the management was under an Englishman, Mr. Forbes.

1253. I believe you are aware that on both the English and Irish railways the general managers of companies have authority to make special bargains with individuals for the carriage of their goods?—Yes.

1254. And that at points where two companies enter into competition with each other, or where there are two independent routes—say from A. to B.—the managers are constantly in the habit of bidding against each other in the market for the traffic?—I take that for granted, from similar cases that have come under my own observation; but I am not aware of that in Ireland.

1255. How do you think that that practice affects the profits of the railway companies?—I think it has been attended, in one instance at least, with the greatest possible advantage; that is, having various rates to suit the circumstances. For instance, to recur to the Dutch-Rhenish Railway, that system was pursued throughout, but in Germany it does not exist, as I have already stated, that I know of, except in the case of very large arrangements which have been made by me with the companies, and in which, however, they always say, "We will give the same "to any one else; we will do the same for others as "for yourself;" but that was not done by the managers, and not either by the whole board, for I think we had to obtain the sanction of the minister to it. But in Holland they admit of that on the Dutch-Rhenish Railway, which was managed by Mr. Forbes, and the success of that railway originated in that freedom on the part of the manager of which I have spoken. He worked for the interests of the concern. The railway shares, when he commenced with it, were at a very low discount, and they are now paying nine per cent. The 16*l.* shares are at 7*l.* premium.

1256. Has Mr. Forbes's railway to compete with other lines?—It had to compete with a line of navigation, the Rhine, and it also had to compete between Rotterdam and Amsterdam with a line of railway that goes by the Hague.

1257. I suppose that if Mr. Forbes hears that there are 100 tons of goods at Cologne waiting to be taken to Amsterdam, he will endeavour to get the carriage of them?—He will send his messengers without delay to try to get those goods to carry.

1258. He would try to underbid the river conveyance ?—Yes, he makes every exertion through his agents to get the traffic for that railway in that way. People soon began to find the advantage of using the railway, and profits quickly flowed into the treasury of the railway.

1259. (*Mr. M'Clean.*) Do not you think that Mr. Forbes is right in endeavouring to get the traffic at low rates ?—Yes, he is perfectly right in the interests of the railway company.

1260. (*Capt. Galton.*) And in the interests of the public ?—Yes, the result was shown directly, by having cheaper means of transport for the benefit of the public.

1261. (*Mr. Dalglish.*) When you established a coal traffic between your collieries and Magdeburg, I suppose you paid to the railway company a rate which was just the difference between what was the value of your coal at the colliery and the value of the coal which came from England ?—You have stated very nearly the principle.

1262. What fixed the principle ?—It was this. Here was an article to be sold at a certain place ; how was it to be sold there ; there was no previously established market for it, so the producer, the carrier, and the seller or the consumer, must agree upon terms, and it was obliged to be an equalized arrangement between them openly carried out, by which the article could be offered at a price it could sell for, and the three parties should participate equally in the profits. On the other hand, however, I may say that where that has not been done openly, very great injustice has been done, and it has prevented railway companies sometimes from carrying out their mission. In the case of a Government railway, in Bavaria, they gave a great reduction of the rates, and the coal owners took a large benefit from that reduction to themselves, whereas in those arrangements in North Germany, the price of the coal at the colliery was fixed and known to the railway companies in treating for a reduction of the rates.

1263. Do they carry all the other produce of the district to Magdeburg at the same rate per ton ?—They take all other coals, but not all other produce.

1264. There would be a special rate for coal ?—Yes, simply a special rate for coal.

1265. They would not carry agricultural produce at the same rate per ton ?—No ; but the experience which they gained in the case of the coal, has induced them to bring agricultural produce from the eastern provinces to the western at very nearly the same rates, I believe.

1266. Why should not the same principle be applied to Ireland. If the coal masters in England, in Wales, or in Scotland could see their way to establishing a large coal trade to Ireland, why should they not say to the railway companies, If you will deliver our coals at a certain rate, we will send the coals to you ?—In the first place, the railway people will say, We are not buyers of coal ; you must organize a system. What was done in Germany was this—we were forced to be not only the coal owners, but the coal merchants in the distant markets, and organized the system, working hand in hand with the carriers or railway companies for a common benefit in establishing a new trade.

1267. You know that at Magdeburg there was a coal trade ?—There was an English coal trade.

1268. In Ireland, do you know that there is a large demand for coal at any particular point ?—In parts of Ireland there is, but not in the interior, to a large amount ; it has to be created by degrees.

1269. The railways do take coal into the interior, do they not ?—They do ; but it is chiefly for their own consumption, and some small quantities for the country ; for instance, in 1863 the receipts of the Great Southern and Western for coal were 9,430*l.*, over the whole line ; on the Dublin and Dundalk nothing ; and on the Midland Great Western 2,000*l.*, so that there is but a small trade at present. On the Dublin and Wicklow they have only just begun, the receipt has been only 170*l.* ; but they are beginning to carry mineral traffic.

1270. (*Lord Donoughmore.*) Have you got a return of the quantity carried to Limerick ?—No, I have not.

1271. (*Chairman.*) Have you stated most of the principal facts which you desire to lay before the Commission ?—Yes.

1272. Is there any back carriage in the trucks which carry your coals on the North German Union lines ?—Scarcely ever. I have read, in the report of a recent debate in the House of Commons, that the Chancellor of the Exchequer referred to the necessity of a back traffic, and I wish to correct it, and to say that neither in England, nor in Germany, nor in fact in any country where there is a large coal traffic, is there any back traffic, because the waggons could not wait for it, and you would require an enormous rolling stock in the shape of waggons to wait for a reloading at the far end, unless arrangements are made to reload similar articles, such as ores; wherever we have them and organize a quick reloading, it is progressing well, and will progress rapidly in Germany. In England, I believe, there is no back traffic, and the regulations have been made on the supposition that there was no back traffic, and that the waggons go back empty.

1273. With regard to the nature of the German unions of railways, they do not amalgamate, do they? —No ; they only unite for the purposes of the through traffic, and they run their rolling stock, but not their locomotives, over the lines. There are scarcely any running powers in Prussia, at least for one railway company to go over another, with a very small exception, near Minden.

1274. The principle is not uniform rates and tolls? —Only for the through traffic; all the domestic or internal traffic is entirely under the control of each separate company.

1275. (*Mr. Glyn.*) For the through traffic are there uniform rates throughout ?—Yes, generally, not always, I believe ; and those rates are settled between the various members of the union.

1276. (*Chairman.*) As to passenger trains in Germany, are they as frequent as is usually the case on most of the railways in this country ?—They are very frequent in the district with which I am best acquainted. There are courier trains, quick trains, and what are called "personnel" trains, which stop at every station ; they are in both directions increasing yearly on every line, and the fullest possible amount of accommodation is given to the passengers there. A matter of the deepest interest, in comparison with Ireland, is the accommodation which is afforded to the 3rd and 4th class passengers, the persons who can pay the least, the low rates at which they are carried, and the amount that these low rates yield towards the profits of the railway companies.

1277. I understood you to say that there is a general feeling now springing up in favour of a system of competition instead of the present system in which there is none ?—Both on the part of the public and on the part of the Government of Prussia. I do not allude to small Governments which have their own interests involved in their own little state lines.

1278. (*Capt. Galton.*) Has not the Government of Prussia several state lines ?—Yes, and they have the exact state of the case, the cost, and everything yearly published in a report which I have here, and which I can leave with the Commissioners ; it gives the statistics of the railways in Germany, showing which are the state railways and which are the private railways, managed by the State, and which are the private railways managed by themselves, the profits obtained, and the cost of working, and every item of general interest connected with them.

1279. Is that for the year 1863 ?—No, it is for 1862 ; the report for 1863 is not yet published for the whole of Germany.

1280. You have stated that you had coal carried from your colliery to Paris ; what is the distance ?—

Mr. W. T. Mulvaney.

5th May 1865.

I have been misunderstood; I said that we could have had it carried; the distance is about the same as the distance to Berlin, to which place we do send it.

1281. What is that distance?—I think that is 75 German miles.

1282. What is the total charge for the carriage of the coal per ton?—I can tell you what the cost is presently—the distance to Paris is about 350 English miles.

1283. Cannot English coal be laid down at Paris cheaper than you could lay it down there?—I do not think so. For the best coals I believe they are prepared to pay 1*l.* a ton in Paris as well as I recollect.

1284. That would give you 5*s.* for the price at the pit's mouth?—Much more. Our average price at the pit's mouth has been down to 5*s.* 7*d.* for all classes of coal, but that class of coal would come to 7*s.* or 8*s.* a ton, screened coal, and the railway freight would be about 12*s.* 6*d.* per ton.

1285. (*Chairman.*) Are there any documents that you would like to hand in?—I will hand in the published statistical account (*handing in the same*).*

1286. Have you any written papers of your own that you would like to hand in?—No.

1287. If there are any questions which have been put to you, and which you have not completely answered, you can add to them when you correct your evidence?—I will do so.

The witness withdrew.

Mr. J. Blackburn.

Mr. James Blackburn examined.

1288. (*Chairman.*) You are the president of the Rochdale Merchants' and Tradesmen's Association?—Yes.

1289. Do you complain of the great disparity in the railway fares to Rochdale as compared with other towns in the district?—Yes.

1290. Can you give any instances of the disparity of which you complain?—I cannot complain very much of the fares myself, but I have no doubt that the two gentlemen who are coming to be examined will be able to go more fully into that matter than I can. But with respect to the accommodation and the running of trains, and the great disparity which exists, I can give some information.

1291. Not with regard to the fares?—Not particularly.

1292. Do you complain of the small number of trains?—Yes, as compared with those which run to other towns close to Rochdale; our own neighbouring towns.

1293. Do fewer trains stop at Rochdale, or come to Rochdale, than go to other towns in the neighbourhood?—Yes, considerably fewer than those which go to towns of much less importance.

1294. Is there but one railway company which has access to Rochdale?—That is all; but within the last few months the London and North-western Company, and, I believe, the Great Northern, have obtained running powers to Rochdale, not direct from Manchester, they come by way of Oldham, which does not at all interest us in Rochdale; it is more for the London traffic.

1295. Have most of the other towns, which you think have more accommodation than Rochdale, communications with different railways?—Yes; Oldham is in communication with two, independently of the Lancashire and Yorkshire, together three railway companies.

1296. What towns do you allude to?—Bury, I believe, has none but the Lancashire and Yorkshire, with the exception of the East Lancashire; they are now amalgamated together, so we may call it one Company, that is, to Bury.

1297. (*Capt. Galton.*) Do more trains run to Bury than to Rochdale?—Yes.

1298. (*Mr. Horsfall.*) What is the population of Bury, as compared with Rochdale?—Bury has a smaller population than Rochdale.

1299. Can you give the population of Oldham as compared with Rochdale?—Oldham has a greater population, but the out townships are included.

1300. (*Mr. Gower.*) What is the population of Rochdale?—Over 38,000, that is, the borough; taking the parish, it is over 100,000.

1301. (*Lord Stanley.*) There are large suburbs, are there not?—Yes, and it is an immense parish; there is a very great difference between the parish and the borough. I can give the Commissioners an instance of what I have stated. I will take Oldham; that has 54 trains per day in and out, and all those trains are third class to Manchester and back, including in and out. Rochdale has only 38, in and out, and 22 of those are third class. I must throw out 11 special trains that they run, when the charge is 1*s.* there and back, but we cannot travel by any other train but them at that fare. If I happen to be in Manchester, and I have got one of the return tickets for 1*s.*, I must come back by one of those trains; they would not allow me to come by any other train by paying the difference.

1302. Is not that the case at Oldham also?—No; every train is third class there.

1303. (*Mr. Horsfall.*) What is the distance between Oldham and Manchester?—About eight miles.

1304. You travel 21 miles for 1*s.*, do you not?—We travel 21 miles for 1*s.*, that is to say, 11 trains per day; those are special trains to and from Rochdale.

1305. You do not complain of the fare being too high?—Yes; but we shall get at that shortly. We want further facilities for travelling to different towns. They charge us 3*s.* first class to Manchester, return ticket. Should I be going single to Manchester, they would charge me 2*s.* for a first-class ticket, whilst from Oldham to Manchester and back the charge is 1*s.* 8*d.* for a first-class ticket return.

1306. Is the distance the same?—The distance is rather longer. I believe it is about 8 miles from Oldham to Manchester.

1307. But they charge you 3*s.* for 21 miles, and they charge the Oldham people 1*s.* 8*d.*?—Yes; and I can quote a greater disparity even than that. There is a small village, a small market town, called Middleton; from Middleton to Manchester and back, first class, the charge is 1*s.*, that is not a penny per mile.

1308. (*Chairman.*) That is the regular train?—That is the regular train; every train has a third class; it is 1*s.* first class, and the distance is 12½ miles.

1309. (*Sir R. Hill.*) That is one penny per mile?—1*s.* first-class return. The distance is 12½ miles, and for the journey there and back they charge 1*s.*

1310. The single distance being little more than six miles?—Yes. Because I happen to come to Rochdale, which is five miles further, I must pay 2*s.* to travel that five miles if I travel first class at all; we are placed in that unfortunate position because we are five miles further, which certainly from Manchester makes it 10 miles; and they issue those return tickets at 6*d.* each from Middleton also; that is third class.

1311. (*Capt. Galton.*) How many railways are there to Middleton?—Only the Lancashire and Yorkshire. The charge is 1*s.* 6*d.* second class from Rochdale to Manchester far a single ticket, and 2*s.* return ticket.

1312. (*Mr. Glyn.*) The Lancashire and Yorkshire is the only line to Middleton?—Yes, the Lancashire and Yorkshire is the only line to Middleton, and the only line to Oldham, *viâ* Middleton.

1313. (*Capt. Galton.*) To what do you attribute this difference?—With regard to Oldham it is the competing lines; there are three lines,

* Statistische Uebersichten der in Jahre 1862, in Deutschland, der Schweiz, Frankreich, Belgien, den Niederlanden und Russland im Betriebe gewesenen Eisenbahnen. Cöln, 1864.

1314. But in the case of Middleton ?—It is a matter of 5½ miles by the road, and omnibuses used to run there; but I believe that the railway company have run them off by reducing their fares.

1315. In fact there is no competition by road to Middleton ?—There would be if it was not for this cheaper fare.

1316. There would not be to Rochdale, you think ?—No, it is too far; it is 11½ miles by the turnpike road to Rochdale; but Middleton is about 5½ miles, and that 5½ miles they run it in half an hour; you cannot go by railway in much less time than that; taking it from Middleton to their junction, and then having to go to Manchester afterwards. Then there is the case of Bury, which is something, I believe, like 26 miles there and back; every train has a third class to Bury; they take passengers there and back for 9*d.* third class.

1317. (*Sir R. Hill.*) Twenty-six miles for 9*d.* ?—Yes; that is because there are omnibuses running every half an hour to and from Manchester.

1318. (*Capt. Galton.*) It is further than from Rochdale ?—Yes, by the route they run.

1319. But from Bury there is only one line ?—There are two, but they are amalgamated.

1320. (*Chairman.*) Is Bury 26 miles or 13 miles from Manchester ?—It is 13 miles, but the return journey is 26 miles, at a fare of 9*d.*, whereas they charge us 1*s.* (and it is a great favour) for that 21 miles.

1321. (*Mr. M'Clean.*) Is that lower than they are entitled to charge ?—I believe our secretary will tell you that they are charging considerably above what the Act of Parliament allows them to charge; but those are merely special trains put on after a deputation from our association waited upon them some months ago.

1322. (*Capt. Galton.*) Their ordinary fares are above what the Act of Parliament allows them to charge, you say ?—Yes.

1323. Then why do you not compel them to reduce the fares ?—We are doing our best; our secretary will read the correspondence.

1324. (*Mr. Glyn.*) What is the ordinary fare ?—Three shillings first class, double journey, for 21 miles; 2*s.* is the charge for a return ticket second class, and 1*s.* 6*d.* return ticket third class; all the single fares are 2*s.* first class for 10½ miles; 1*s.* 6*d.* second class for that distance, and 10*d.* for third class, which is just under a penny per mile.

1325. (*Mr. Horsfall.*) What is the maximum fare which the company could charge ?—I cannot say. I believe it is 1½*d.* per mile.

1326. (*Chairman.*) Those are the return fares, except on those special trains ?—Yes, except on those special trains.

1327. There are 11 of them, are there not ?—Yes, six one way and five the other way; but every station they run to besides are at the ordinary fares only.

1328. (*Capt. Galton.*) How many third-class trains are there to Rochdale ?—There are 22 trains a day, in and out, and 11 of those are special trains, which are no use to the trading public of Rochdale, because we must come back by them.

1329. (*Chairman.*) Are they inconvenient hours for returning ?—Very inconvenient hours. I went the other day. I was too late; there was another third class. I said, "Can I go on to Rochdale by "paying the difference in the fare;" they said, "No, "you will have to go by the train you booked by;" so I said, "Can I go by the second-class train," and they said, "Not unless you pay the full fare."

1330. (*Mr. M'Clean.*) Was this other train a through train ?—Yes, the through train to Yorkshire.

1331. Do you think that the railway company could regulate the through traffic properly if they allowed the local traffic to interfere with it ?—I have no doubt they could. They have also got the canal in their own hands, and they have raised the freights on that canal. Some short time ago they bought the interest in the canal; so you see that as far as the goods traffic is concerned, they have it all in their own hands; they can charge what rates they think fit.

1332. (*Chairman.*) Do you complain of the rates with regard to goods ?—The goods question is a very important feature, which our secretary will go into.

1333. Is there any other point which you would wish to state yourself ?—The is one other point which I should like to speak to. I am not fond of Sunday travelling, but merely to show the position they place our town in with regard to Rochdale. Should I be in Manchester on Sunday, I cannot get to Rochdale from a quarter past 10 in the morning until 10 minutes past 5 at night. Oldham has three trains during that time. I should have to wait in Manchester seven hours. It is almost worse than that from Rochdale to Manchester. I cannot go from Rochdale to Manchester from 25 minutes past 1 in the afternoon until 9 o'clock at night; that is, I should have to wait for eight hours. In those other towns it is different. I believe Middleton has four trains during that time in the afternoon; and I believe that Oldham has three trains; they have three and four trains while we are standing for eight or nine hours in Rochdale.

1334. (*Mr. M'Clean.*) Can you go to Bolton ?—No, we can only go to Bolton by three trains on a Sunday; but Oldham has considerably more trains than we have to Rochdale, also from Liverpool.

1335. (*Mr. Horsfall.*) You do not complain of that ?—Not at all. I merely show our position as compared with Oldham.

1336. You would not propose that extra trains should be put on on Sunday ?—No, it is merely to show how we are trifled with, even if we did require more trains.

1337. I should suppose you would rather object to the company putting more trains on ?—No, I should only like to be set on a par with other towns.

1338. (*Capt. Galton.*) You complain of the inequality ?—Yes. If I was called upon a very important errand, such as to visit a sick friend in Manchester, I should have to put the horse in my gig, or have to wait at Rochdale for nine hours. I could not go by train. There are circumstances which happen in men's lives when Sunday travelling is very important. I am no Sunday traveller myself. I am generally very glad to stay in on Sundays.

1339. (*Chairman.*) Is that the only line of railway between Oldham and Rochdale ?—It is a branch from their main line; their main line is the Middleton junction. It is exactly a mile from their junction, and it has been opened about two years now. Oldham has 16 trains on Sunday, while we have only eight, which is two to one.

1340. There are three different companies which have lines between Oldham and Manchester, are there not ?—Yes, there are three different companies which run into Oldham, that communicate with Manchester.

1341. (*Earl Donoughmore.*) The most direct line is the Lancashire and Yorkshire, is it not ?—That is the most direct line.

1342. (*Mr. Horsfall.*) Do you not think if the railway company saw it was for their advantage they would put more trains on ?—I cannot speak to that. One would be led to think that they are not studying their advantage now by running those special trains for 1*s.* The better class of individuals, men of very high standing in Rochdale, are travelling by the 1*s.* trains, because they cannot get a reduced first-class train; they are called ticket-of-leave trains, or Surat trains, even by the company's own officials. Some of the most wealthy men travel by those trains.

1343. You do that to vex the railway company ?—If we cannot have cheap first-class fares, we must take the cheapest fare we can get.

1344. (*Chairman.*) Is there any other statement you wish to make to the Committee ?—No.

The witness withdrew.

Mr. J. Fletcher.

5th May 1865.

Mr. JAMES FLETCHER examined.

1345. (*Chairman.*) You are secretary to the Rochdale Merchants' and Traders' Association, are you not ?—Yes.

1346. The people at Rochdale, I believe, complain that they are not faily treated by the railway companies as compared with other towns ?—They do.

1347. Can you give instances of the treatment of which your association complain ?—Yes. We complain that we have not a sufficient number of trains compared with the neighbouring towns in the district; for instance, Bury, Oldham, and Middleton. I am speaking of Manchester. Now to those places we have, with very few exceptions, second and first class fares only.

1348. You speak of the number of trains between Manchester and those different towns ?—Yes, for the moment I do. Up to the 1st of March last there was only an opportunity of coming from Manchester to Rochdale by six trains at third-class fares. On the 1st of March, after an interview which we had with the directors of the Lancashire and Yorkshire Company, they put on extra trains, which they called special service trains, and those special service trains go from Rochdale to Manchester and back for 1*s.*; but those trains are fixed at certain times in the day, and a passenger going down by one of those is obliged to come back by it. He can only come back at the time fixed for him. For instance, if he goes down at 2 o'clock in the afternoon, he must come back either at 4 o'clock or a quarter past 7 in the evening. We find that from Bury, passengers can book third class by all trains to Manchester, and the same remark applies to Ashton, Oldham, and Middleton. From Bury to Rochdale we can only come by three trains at third-class fare during the day. From Rochdale to Bolton we can only go by four trains in the day. Then we complain again of the fares to Liverpool. In booking to Liverpool, return ticket, second class, the fare is 7*s.* 3*d.*, which is the same fare as is charged from Oldham, it being six miles further each way.

1349. (*Mr. Horsfall.*) What is the distance from Rochdale to Liverpool ?—About 40 miles against 46 miles from Oldham.

1350. What is the fare ?—7*s.* 3*d.*

1351. (*Chairman.*) For the double journey ?—For the double journey.

1352. (*Capt. Galton.*) You can change carriages at Rochdale and pass through to Oldham, can you not ?—Yes.

1353. They charge less from Oldham to Liverpool than they do from Rochdale ?—They charge the same now; recently we have obtained a reduction of 1*s.* 3*d.* since we have been agitating the question.

1354. (*Earl Donoughmore.*) We understood from the last witness that there is great competition at Oldham and none at Rochdale, is that so ?—Yes; that is the position we are placed in. In the fares down to Manchester, which I may say we complain about most severely, we asked the directors of the Lancashire and Yorkshire Company to give us return tickets to Manchester and back for 2*s.*, first class; 1*s.* 6*d.*, second class; and 1*s.*, third class; those fares to be available by every train. In answer to that we obtained the special service trains I have spoken of, and that is all the concession the directors have made.

1355. (*Capt. Galton.*) Do they send only one class for those special service trains ?—You can take any class you like, but the passenger booking at special service or third class must return by the train at fixed times.

1356. What is the fare ?—1*s.*, third class.

1357. What is the first-class fare ?—There is no alteration.

1358. You go at the ordinary fare ?—Yes.

1359. And you can go back by any train ?—Yes.

1360. But the third class is a special rate, and you must go by that ?—Yes.

1361. (*Mr. Horsfall.*) At what hour does the earliest special train start ?—It starts from Rochdale at half-past seven.

1362. May you not come back by the special train at a quarter past seven in the evening ?—Yes.

1363. Or by any special train which runs on the same day ?—Yes; decidedly.

1364. Either at two o'clock, four o'clock, or a quarter past seven ?—Yes.

1365. (*Chairman.*) Are the fares by those special trains lower than the fares from Oldham and Bury by the ordinary trains ?—No; they are not so low in proportion.

1366. (*Mr. M'Clean.*) Do you know what fares are authorized by the Act of Parliament ?—2*d.* first class, 1½*d.* second class, and 1*d.* third class.

1367. Is the actual charge higher anywhere ?—It is higher in the Yorkshire districts, I believe, than the fares authorized by the Act.

1368. (*Capt. Galton.*) Is the first-class fare to Bury higher than is authorized by the Act of Parliament ?—They charge 10*d.* second class to Bury; it is about six miles.

1369. (*Mr. Horsfall.*) Which company is that ?—The Lancashire and Yorkshire.

1370. Do they charge more than the legal fare ?—I think so.

1371. (*Capt. Galton.*) Have you no means of compelling them to reduce the fares in the ordinary course of law ?—We have never threatened anything of that kind; we have been trying to do it conciliatorily.

1372. (*Mr. Glyn.*) Is 2*d.* per mile their maximum charge ?—I think it is so stated on their boards.

1373. (*Sir R. Hill.*) Is that the fare or a toll ?—The fare.

1374. You speak of its being on their boards ?—Yes.

1375. Are you not confounding the fares and tolls? —I was told, and I have understood, that they were the fares.

1376. (*Capt. Galton.*) Have you ever brought to the notice of the company the fact of their charging higher than the maximum fares authorized by the Act ?—No, I think not.

1377. You did not mention that at the interview which you have spoken of with the directors ?—No.

1378. (*Chairman.*) Do you attribute those disadvantages under which you are placed in Rochdale to there being no competing line ?—We do.

1379. Are the Lancashire and Yorkshire and the London and North-western Companies actually competing between the other towns; for instance, between Bury and Manchester ?—Between Bury and Manchester there is the East Lancashire, which has recently amalgamated with the Lancashire and Yorkshire. To Bury the trains have to compete with omnibuses from Manchester, and in consequence of that competition they send special trains to Manchester and back for 9*d.*

1380. (*Earl Donoughmore.*) For 9*d.* third class ? —Yes, third class.

1381. That is further than to Rochdale ?—Yes, considerably.

1382. (*Chairman.*) Why cannot they set up omnibus competition ?—They can run the distance from Bury to Manchester, but they could not make the omnibuses pay on the Rochdale road.

1383. (*Earl Donoughmore.*) Is that a very hilly road ?—It is rather hilly, but it is a very good road.

1384. (*Mr. Glyn.*) There is not the same amount of population, I suppose ?—There is not the same amount of population as there is on the Manchester and Bury road.

1385. (*Chairman.*) You have also complaints to make with regard to the carriage of goods, I believe ? —Yes; I will mention one instance. In cotton,

which is very much consumed at Rochdale and the neighbourhood, the rate for cotton from Liverpool to Rochdale is 12*s.* per ton; to Heywood, which is only three miles nearer Liverpool, it is 10*s.* per ton.

1386. (*Capt. Galton.*) On the same line?—On the same line.

1387. What is the whole distance?—About 40 miles. From Liverpool to Oldham, coming through Rochdale, which is six miles further, the rate is 10*s.* 10*d.* as against 12*s.* to Rochdale.

1388. (*Earl Donoughmore.*) There is, again, competition at Oldham and none at Rochdale?—Yes; the consequence is, that the spinners at Rochdale consign the cotton to Heywood, and cart it to Rochdale.

1389. (*Mr. Glyn.*) There is a canal to Heywood, is there not?—Yes.

1390. (*Earl Donoughmore.*) I thought you said that the canal was in the hands of the railway company?—It is considered to be so; still, that has been alleged as the cause of the difference in the rates.

1391. (*Mr. Horsfall.*) Are the rates the same by canal and railway?—I believe they are the same. One of the directors of the railway company fetched his cotton from Heywood two years ago.

1392. (*Captain Galton.*) What is the cost of cartage per mile per ton?—It is under 2*s.* for the distance from Heywood.

1393. For the three miles?—Yes.

1394. (*Mr. M'Clean.*) Is the cotton delivered by the railway company?—They charge 1*s.* per ton in addition for delivery.

1395. (*Chairman.*) That charge is the same at all places?—Yes, but the carriage is 1*s.* 2*d.* per ton less to Oldham than it is to Rochdale.

1396. (*Mr. Horsfall.*) Do you know the quantity of cotton brought from Liverpool to Rochdale in the course of the year?—No, but it is a very considerable quantity.

1397. You have not made any calculation with regard to the aggregate amount of loss arising from the difference in carriage?—No, I have not. The average for the last three years from Liverpool has been very small comparatively. It would form a very serious sum if the trade was in its usual state.

1398. (*Capt. Galton.*) Has this disparity which you complain of prevailed for long?—For a considerable time. It was only at the remonstrances of the Rochdale people that the rate was lowered; it was formerly 13*s.*; they have reduced the rate to Rochdale 1*s.*, and put on 1*s.* to Heywood, since the agitation.

1399. It used to be 9*s.* to Heywood and 13*s.* to Rochdale?—Yes.

1400. (*Mr. Horsfall.*) The company do listen to your remonstrances then?—To some extent they have done so. We have a few particulars to Liverpool. For produce, such as sugar, from Liverpool to Rochdale it is 13*s.* per ton, to Oldham it is 12*s.* again.

1401. (*Mr. Glyn.*) That difference prevails with regard to all classes of goods in fact.—It does.

1402. (*Chairman.*) There are two lines from Liverpool to Oldham?—Yes; the London and North-western and the Lancashire and Yorkshire.

1403. Is the charge the same by whichever line it goes?—It is more particularly the Lancashire and Yorkshire line that I speak of. Most of the produce comes by the Lancashire and Yorkshire to Rochdale; it comes direct, and it is easier loading from the dock warehouses.

1404. Would the London and North-western take it to Rochdale at lower rates?—The London and North-western do not go to Rochdale; only through Oldham.

1405. They go to Oldham, do they not?—Yes, they go to Oldham, but they do not carry goods to Rochdale through Oldham; all the cotton practically comes by the Lancashire and Yorkshire.

1406. (*Mr. Glyn.*) How long have the London and North-western Company had a line open to Oldham?—I should say that the London and North-western Company have had their line open to Oldham for four or five years. The same remarks that apply to cotton apply equally to timber. There is a very extensive timber merchant at Rochdale. He told me that on one cargo of timber he could have had it carried to Oldham at a cost of 90*l.* less than he had it brought to Rochdale. Of course it was a very large cargo.

1407. (*Capt. Galton.*) Carried through Rochdale?—Carried through Rochdale. The consequence is that the timber merchants at Oldham can undersell the Rochdale merchants in the various villages round about. The carriage makes a very great difference in the price of timber.

1408. (*Mr. Horsfall.*) Do you know the extent of that cargo?—I could not state the extent of it, but it was very heavy. In machinery for export from Rochdale to Liverpool, the rate is 13*s.* per ton, and from Oldham, notwithstanding the extra distance again, the carriage is 12*s.* 3*d.* per ton.

1409. (*Mr. Glyn.*) The same principle applies throughout, in fact?—Yes, all through. It is only a repetition of the same remarks that will apply to all goods. Mr. Lawton, a member of our committee, will give you more particulars.

1410. (*Chairman.*) Is there any other point that you particularly wish to state to the Committee?—No. Mr. Lawton is carrying goods constantly and paying for them, and he has a great many instances to furnish to the Committee.

1411. Is he a Rochdale merchant?—Yes, in the iron trade.

The witness withdrew.

Mr. Robert Lawton examined.

1412. (*Chairman.*) You are a merchant at Rochdale?—Yes.

1413. In what trade?—I am a machine broker and general dealer.

1414. Do you complain of the railway charges to Rochdale being higher than to other towns in the neighbourhood?—Yes.

1415. Will you give the Committee instances?—From Hull to Rochdale the rate is 4*s.* per ton less than to Oldham, coming through Rochdale, and six miles further. Last September I bought a quantity of boilers at Market Harborough, and I booked several of them to Rochdale at 30*s.* per ton. Thinking that this was a high rate, I went to the company, and asked the rate to Manchester; I was told that it was 13*s.* 4*d.*, and I booked the remainder to Manchester at 13*s.* 4*d.* It is 30*s.* to Rochdale, but I re-booked from Manchester by the Lancashire and Yorkshire at 3*s.* 4*d.*, making together 16*s.* 8*d.*, thereby saving 13*s.* 4*d.* per ton.

1416. (*Mr. Glyn.*) That was by the Midland I suppose?—No, by the London and North-western. There was a saving of 13*s.* 4*d.* per ton by booking twice.

1417. (*Capt. Galton.*) What is the cause of that difference?—I cannot say. By booking to Oldham and Manchester I can save 25 per cent.

1418. (*Mr. Glyn.*) Do the London and North-western Company book direct to Rochdale?—Yes.

1419. They have no direct line to Rochdale, have they?—No, but they run their carriages through. They have conveyances there.

1420. (*Chairman.*) The Hull traffic would come over the North-eastern, would it not?—Yes; and down the Lancashire and Yorkshire, from Normanton.

1421. Have you any other instances to give the Committee?—Sough station, near the neighbourhood of Blackburn, all on the Lancashire and Yorkshire Company's line; I booked machinery last October.

Mr. R. Lawton.
5th May 1865.

The rate to Rochdale for 18 miles is 12*s.* 6*d.* per ton; to Manchester, 18 miles, 9*s.* 2*d.*; and to Oldham, 24 miles, 10*s.*; all of which has to pass through Rochdale.

1422. (*Mr. Horsfall.*) What line was that?—All by the Lancashire and Yorkshire. There is another instance, Haslingden station, on the Lancashire and Yorkshire. The rate to Rochdale for machinery, a distance of 15 miles, is 10*s.* per ton; to Manchester, 18 miles, 6*s.* 4*d.* per ton; and to Oldham, 21 miles, 8*s.* 4*d.* per ton. That is all on the Lancashire and Yorkshire railway.

1423. (*Mr. M'Clean.*) Does that exclude the collection and delivery in each case?—Yes, in each case. From Blackburton, in Westmoreland, the rate for machinery is 8*s.* per ton less to Oldham than if left at Rochdale, though coming through Rochdale, and six miles further in distance. The Lancashire and Yorkshire railway runs 39 miles of the distance on their own line. The rate from Halifax to Manchester, 33 miles, is 14*s.* per ton; from Halifax to Oldham, 29 miles, 14*s.* per ton; from Halifax to Rochdale, 23 miles, 16*s.* per ton; all on the Lancashire and Yorkshire Company's line, and all through Rochdale. From Lancaster to Rochdale the rate is 12*s.* per ton; from Bay Horse station to Rochdale, being four miles nearer, the charge is 17*s.* per ton; from Benton to Oldham, which is 15 miles further than Lancaster, and passes through Rochdale, making together 21 miles further than to Rochdale, the rate is 10*s.* per ton; this is 2*s.* less than from Lancaster, and 7*s.* less than from the Bay Horse station.

1424. (*Chairman.*) From the Bay Horse station to Rochdale is nearer than from Lancaster to Rochdale?—Yes, it is four miles nearer Rochdale.

1425. (*Capt. Galton.*) It is nearer from Halifax to Rochdale than it is to Oldham on the same line, is it not?—Yes.

1426. Halifax has only the Lancashire and Yorkshire to accommodate it?—Not direct to Oldham.

1427. Can you account for that difference?—No, I cannot; it is the same as those other cases.

1428. No; there are other railways; but in the case of Halifax and Oldham there is no second line; is not that so?—Many of those places are on the Lancashire and Yorkshire, and there is no competing line; there is only the Lancashire and Yorkshire.

1429. (*Mr. Horsfall.*) Have you made representations to those companies about these inequalities?—Yes; I have been with a deputation to the directors, and I mentioned those cases; they promised to make concessions, but they have not done so; in fact they wrote to say that they had altered certain rates in the East Lancashire district. I have been to inquire and I find that they have not done so. There is no competing line, and they charge us 25 or 30 per cent. more to Rochdale than they do to Oldham.

1430. Does the same remark apply to Leeds?—I have not much traffic with Leeds.

1431. (*Earl Donoughmore.*) Are you a manufacturer of machinery?—I am a machine broker; I buy and sell machinery.

1432. (*Mr. Roebuck.*) Are there other people in the same line at Oldham?—Yes.

1433. Do you find that the advantage which the Oldham people have in lower rates is a serious disadvantage to you?—It is very serious; they have better markets than I have, and I pay 25 per cent. more rom any part of England than they do at Oldham.

1434. With heavy machinery I suppose the cost of transport enters very largely into the total cost of the article?—Just so.

1435. (*Chairman.*) Have those grievances been of long standing?—Yes.

1436. Have you often made complaints to the Lancashire and Yorkshire Company?—I have often made complaints to the officials at the Rochdale station. I have been only once before the directors. I had as much as 12*l.* or 13*l.* deducted once for overcharges.

1437. They do allow you a reduction afterwards?—They give me a fixed rate; they do not bring in their accounts as they give the rates. Within a fortnight I have had a reduction to Blackburn and Rochdale.

1438. (*Capt. Galton.*) Do those high rates operate disadvantageously to Rochdale, to prevent people from opening manufactories there?—I should think it must. They have not the same chance as the neighbouring towns have. I have had some thoughts of removing to Oldham. It would make a difference of 200*l.* or 300*l.* a year to me.

1439. (*Mr. Horsfall.*) Of course it presses more heavily on heavy goods?—Yes. We have large machinery makers in our neighbourhood. The principal goods go to Lancaster, Wigan, and the neighbourhood of the Lancashire and Yorkshire line, and they charge us from 25 to 30 per cent. more than the Oldham people pay for their machinery, which has to come through Rochdale.

1440. (*Mr. Glyn.*) This heavy charge applies to all classes of goods, I presume?—Yes, to all goods that I have had any experience of.

1441. (*Mr. M'Clean.*) Does it apply to coals?—I cannot speak to coals. In half a dozen of those cases which I have quoted there are no competing lines to Oldham; it is all on the Lancashire and Yorkshire.

1442. (*Chairman.*) Even though the traffic is all in the hands of the Lancashire and Yorkshire Company, Rochdale is placed at a disadvantage compared with other places?—Rochdale is placed at a disadvantage to the extent of 30 per cent. I send carts 10 or 15 miles from Rochdale. I can get it done cheaper and better and at a less risk of breakage.

1443. Can you assign any reason for the proceedings of the Lancashire and Yorkshire Company with regard to Rochdale?—No; only that we have no competition at Rochdale.

1444. (*Capt. Galton.*) Can you suggest any remedy for this?—I cannot suggest any remedy but a competing line; it is a very serious thing to the Rochdale people.

1445. (*Mr. Horsfall.*) And if you had got a competing line they would amalgamate perhaps?—Yes.

1446. (*Earl Donoughmore.*) What would you think of obliging the railway companies to charge equal mileage rates for the same class of goods all over their systems?—It would be a very good system, and it ought to be adopted. All railway companies should carry a certain class of goods at certain rates.

1447. You wish that they should not have that power to favour one place by giving a lower rate than to other towns?—Just so. I think they should not have the power to do so. I will give you some more instances. From Hull to Rochdale by a third class train, the fare is 5*d.* less than it is from Hull to Oldham, which is six miles further. It is the Midland Railway to Normanton and then Lancashire and Yorkshire from Normanton; but they have to convey the Oldham passengers through Rochdale, and although it is six miles further, they take them for 5*d.* less third class.

1448. But there is a competing line from Normanton to Oldham that does not pass through Rochdale at all; the London and North-western comes there by Saddleworth, does it not?—Perhaps there may be competition, but I was not aware that the London and North-western ran up to Normanton.

1449. (*Chairman.*) Are there any other of those disparities to which you wish to call attention in particular?—There are three very serious disparities on the Lancashire and Yorkshire. To Haslingden there is about 40 per cent. difference. It is 18 miles to Manchester, which is 6*s.* 4*d.*, Rochdale is 10*s.* This is on the Lancashire and Yorkshire; there is no competing line there, it is all their own line.

1450. Can you give the Committee any explanation of that?—No; we waited on the directors, and they promised to remedy it, and to put us on an equal footing, but they have made no alteration.

1451. Is there any other matter to which you would wish to call the attention of the Committee?—No.

1452. Will you hand in the tabular statement which you hold in your hand ?—Yes.

The same was handed in, and is as follows :

MACHINERY AND IRON.

September 1st 1864.—Lines used, London and North-western.

Market Harborough to Rochdale. I sent several old boilers from this place direct to Rochdale, the charge being after the rate of 30*s.* per ton.

10½ miles, Lancashire and Yorkshire.

Finding the rate heavy I booked the next lot just to Manchester at a charge of 13*s.* 4*d.* per ton, and re-booked there by the Lancashire and Yorkshire at 3*s.* 4*d.*, making together 16*s.* 8*d.*, thereby saving 13*s.* 4*d.* per ton.

Sough Station, near Blackburn, all on Lancashire and Yorkshire Company's Line.

Rate to Rochdale for machinery, 18 miles, 12*s.* 6*d.* per ton.
„ to Manchester „ 18 „ 9*s.* 2*d.* „
„ to Oldham „ 24 „ 10*s.* „

Haslingden Station, Lancashire and Yorkshire.

Rates to Rochdale for machinery, 15 miles, 10*s.* per ton.
„ to Manchester „ 18 „ 6*s.* 4*d.* „
„ to Oldham „ 21 „ 8*s.* 4*d.* „

From Blackburton in Westmoreland machinery is 8*s.* per ton less to Oldham than if left at Rochdale, though coming through Rochdale, and six miles further in distance. Lancashire and Yorkshire railway have 39 miles of it on their own line.

GOODS TRAFFIC.

Rates.

Halifax to Manchester, 33 miles, 14*s.* per ton.
Halifax to Oldham, 29 „ 14*s.* „
Halifax to Rochdale, 23 „ 16*s.* „

All through Rochdale, and on the Lancashire and Yorkshire Company's own line. *Mr. R. Lawton.*

5th May 1865.

Lancaster to Rochdale - - - 12*s.* per ton.
Bay Horse Station to Rochdale, being four miles nearer - - - - 17*s.* „

Benton to Oldham, which is 15 miles further than Lancaster, and passes through Rochdale, making together 21 miles farther than to Rochdale, 10*s.* per ton.

This is 2*s.* less than from Lancaster, and 7*s.* less than from Bay Horse Station.

PASSENGER TRAFFIC.

Hull to Rochdale by 3rd class train is 5*d.* less than Hull to Oldham, six miles further.

Leeds to Rochdale.—There is a 3rd class train that leaves at 5.30 P.M., and it is the last 3rd class train that passengers can book to Rochdale by, but there is one at 8.10 P.M., where the fare is 1*s.* 9*d.* less to Manchester than to Rochdale by the same train.

Rochdale to Bolton.—Return tickets 2nd class was 2*s.* 10*d.* until lately. Distance there and back 25 miles, 2*s.* 6*d.*

Oldham to Bolton.—Return tickets 2nd class. Distance there and back 37 miles, 2*s.* 9*d.*

Middleton to Manchester.—Return tickets at 3rd class fares are issued by every train. 3rd class 6*d.*, 1st class 1*s.* Distance 5½ miles.

Middleton to Rochdale, and Rochdale to Middleton.—Passengers cannot get this journey for less than 1*s.* 8*d.*, with the exception of about two trains a day at 1*s.* 2*d.* The distance being the same as from Middleton to Manchester, charge 6*d.*

Rochdale to Bury, and Hayward to Oldham.—The same remark as above will apply.

Preston to Todmorden, *viâ* Rochdale, distance 42 miles, 3rd class single fare is 2*s.* 6½*d.*

Preston to Rochdale, distance 33 miles, 3rd class fare is 2*s.* 9*d.* single.

The witness withdrew.

Adjourned to Wednesday next at 12 o'clock.

Wednesday, 10th May 1865.

PRESENT :

THE RIGHT HON. THE EARL OF DONOUGHMORE.
THE RIGHT HON. LORD STANLEY, M.P., F.R.S.
THE HON. E. F. LEVESON GOWER, M.P.
THE RIGHT HON. ROBERT LOWE, M.P.
J. A. ROEBUCK, ESQ., M.P.
T. B. HORSFALL, ESQ., M.P.
ROBERT DALGLISH, ESQ., M.P.
GEO. CARR GLYN, ESQ., M.P.
A. S. AYRTON, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., F.R.S.
E. T. HAMILTON, ESQ.
J. R. M'CLEAN, ESQ., PRES. INST. C.E.
WILLIAM POLE, ESQ., F.R.S., *Secretary.*

HIS GRACE THEDUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

Mr. WILLIAM FORBES examined. *Mr. W. Forbes.*

10th May 1865.

1453. (*Chairman.*) You have been for many years, I believe, engaged in the management of railways, both in England and in Ireland ?—Yes, for the last 20 years.

1454. What railways have you been connected with in Ireland ?—With the Midland Great Western of Ireland, and the Great Northern and Western. I will explain to your Grace on the map.

[The witness pointed out, on the map, the lines of railway with which he had been connected.]

1455. Are you now manager of both those lines of railway which you have mentioned ?—Not at the present time ; I have left Ireland for about a month.

1456. Up to a month ago were you the manager of both the Midland Great Western and the Great Northern and Western lines ?—Yes.

1457. Had you then opportunities of becoming well acquainted with the districts traversed by those railways ?—Certainly with regard to those, and I am tolerably well acquainted with all the systems of railways in Ireland.

1458. Have you formed any opinion as to the effect of the present rates and fares which are charged upon the Irish railways, and whether they are calculated or not to develop, as far as possible, the traffic of the country ?—In my opinion they are prohibitory of any development of the traffic, and have been so ever since I have known the country.

1459. Can you adduce any facts to corroborate your opinion ?—Yes. I have had occasion frequently to compare the rates charged in Ireland with those charged upon other railways, and particularly in England, and in the majority of cases the Irish rates are as high, and in some cases higher, than on the English lines of railway ; and considering that Ireland is a very poor country, I do not think that that is a fair state of things, because the lines have been made cheaply, and they have to accommodate a poor population. I therefore think that the rates there should be considerably lower than the rates in England. Practically, since the opening of the railway system in Ireland, nothing has been done in the way of experiment ; they started with the English rates, English passenger fares were established in Ireland, and they have done nothing to alter them ; they have not tried to lower the rates ; I think the result would be a very large increase in the traffic, and a great benefit to the country, if they tried a very much lower scale of rates.

1460. (*Lord Donoughmore.*) Did you recommend to your directors that an experiment of that kind

Mr. W. Forbes. 10th May 1865.

should be tried?—Yes; but I was always obliged to accompany it with the explanation that anything in the way of an alteration must be a very liberal one indeed, quite as much as 50 per cent., and that the effect of that would be no doubt a loss of dividend for two or three years, or even for a longer time, but that the Boards of Directors have regarded as a very unpalatable proposition, and they have never been able to accept it.

1461. (*Mr. Glyn.*) Do your remarks apply both to passengers and to goods?—Yes.

1462. (*Chairman.*) Are the fares charged for passengers upon those railways at the present time as high as those charged in England?—Yes.

1463. Is it so also upon goods?—Yes.

1464. Are the rates in any cases higher?—They are higher upon goods, and upon one article, coal, which no great effort has been made to carry on the Irish lines of railway, they are twice as much.

1465. (*Capt. Galton.*) What is the rate charged for coal?—The minimum rate is $\frac{3}{4}d.$ a ton on the Midland Great Western, but upon other lines it ranges from $1d.$ to $1\frac{1}{4}d.$, and sometimes as high as $1\frac{1}{2}d.$ per ton per mile.

1466. (*Mr. Hamilton.*) What is the rate charged in this country?—$\frac{1}{2}d.$ per ton per mile.

1467. What is the minimum and what is the maximum rate on the English lines?—I think you may take it, that the general rate all over the country for coals from the north and from Wales is $\frac{1}{2}d.$ per ton per mile.

1468. Are you not aware that many railway companies carry coals for $\frac{3}{8}$ths of a penny per ton per mile?—No.

1469. (*Mr. Horsfall.*) Can you state what is the lowest rate that is charged on grain in Ireland?—For long distances it is about $1\frac{1}{4}d.$ per ton per mile, but $1\frac{1}{2}d.$ is the average rate.

1470. What is the difference in the charge for taking goods 20 or 30 miles and taking them a longer distance?—For the first 50 miles the general principle is to charge $1\frac{1}{2}d.$ per ton per mile, and for a further distance of 25 miles $1\frac{1}{4}d.$ per ton per mile, beyond that $1d.$ per ton per mile.

1471. Does that include the terminal charges?—No, there is $1s.$ charged at each end for terminals.

1472. (*Capt. Galton.*) Where does the coal come from?—From England entirely.

1473. To what ports does it come?—To all the ports, including Dublin. The Midland Great Western system is supplied entirely from Dublin.

1474. Does the port of Sligo furnish any coal?—A very small quantity indeed, and that is for local consumption.

1475. Is it carried by sea to Sligo?—Yes.

1476. Would a rate of $\frac{1}{2}d.$ per ton per mile, or any lower rate, say $\frac{3}{8}$ths of a penny, enable the coal to be carried from Dublin to Sligo?—Yes. I think that the coal could be carried at a rate of $5s.$ a ton all over Ireland, that being the maximum rate, for a distance of 120 miles, at $\frac{1}{2}d.$ per ton per mile.

1477. (*Chairman.*) Is the coal traffic very limited in Ireland now?—Yes. The Midland Great Western Company's system extends over about 330 miles, and the traffic upon that in coals is only 200 tons a week.

1478. (*Mr. Hamilton.*) What are the worst gradients on that line?—On the main line the worst gradient of any extent is about 1 in 90; they are very fair gradients.

1479. (*Lord Donoughmore.*) The curves are bad, are they not?—Near to Dublin they are; they follow the line of the Royal Canal.

1480. (*Capt. Galton.*) At what price is the coal delivered in those ports by ship?—In Dublin it is delivered at from $11s.$ to $12s.$ a ton.

1481. Could it be then delivered on the Midland Great Western line at $16s.$ a ton?—Yes, I believe so.

1482. What price is it now sold at at the station?—It has never had any fair trial yet, but the price ranges from $23s.$ to $30s.$, the fact being that it is not used, except by some few noblemen, who can have a cargo brought over, or who may order 10 or 20 tons at a time.

1483. Do you think the coal would entirely supersede the peat?—Yes.

1484. Even on the Midland Great Western line?—Yes. I believe that if the price of the coal was $1l.$ a ton it would entirely supersede the use of turf procured at their own hall doors; and I consider that if coal was supplied at $1l.$ a ton it would be more economical fuel than turf.

1485. (*Lord Stanley.*) Is not a great deal of the labour supplied by the peasantry at times when their labour is of no other value to them?—No; because I know that they are very often engaged in saving turf when they ought to be doing something else.

1486. (*Mr. Hamilton.*) Are you aware what the gradients are upon the principal coal-carrying lines in this country?—Yes; on the Great Northern, that I was connected with, I had charge of a division of it.

1487. Do you suppose that there are any gradients on the Great Northern Railway as adverse as 1 in 90?—For some short distances only; the one that I gave you is, I think, the worst gradient that there is, except one coming into the station at Dublin, that is a descending gradient into the station, and that is about the worst gradient that there is; it is a very favourable line.

1488. The cost of carrying coal, I presume, would depend very much upon the gradients of the line?—Yes.

1489. (*Chairman.*) Have you ever urged upon the directors of the railway with which you have been connected the policy of trying the effect of a reduction of the rates upon coal especially?—Yes; when I joined them I found that the rate was about $1\frac{1}{4}d.$ per ton per mile; I recommended them to reduce it to $\frac{1}{2}d.$, but I induced them eventually to reduce it to $\frac{3}{4}d.$

1490. What was the effect of reducing it from $1\frac{1}{4}d.$ to $\frac{3}{4}d.$?—That the traffic increased, I think, about 25 per cent.

1491. That was attended with loss probably?—No, I think not; the reduction that was made was not sufficient to create any loss. I think that anything short of $\frac{1}{2}d.$ a ton per mile would not be of the least use.

1492. (*Mr. Ayrton.*) Upon what calculation is that opinion of yours based?—It is based upon this, that at a rate of $\frac{1}{2}d.$ a ton per mile you can deliver coals into all the principal towns in Ireland for about $16s.$ or $17s.$ a ton, and I believe that for mere domestic purposes it would entirely supersede the use of turf.

1493. What difference would $\frac{1}{4}d.$ make?—With a maximum charge of $5s.$ a ton, about $2s.$ $6d.$ a ton.

1494. What distance would that be for?—That would be for 120 miles.

1495. But where are the places or towns of any great magnitude 125 miles distant from the seaports in Ireland?—Take, for instance, Mullingar, Ballinasloe, and Galway. Galway is 126 miles from Dublin, right across the country.

1496. But Mullingar is not 125 miles from Dublin?—No; and therefore it could be delivered at a smaller rate. I propose $5s.$ as the maximum rate.

1497. You say that a difference of $\frac{1}{4}d.$ would make an increase of $2s.$ $6d.$ a ton as supplied to a distance of 125 miles from a seaport in Ireland?—Yes.

1498. What are the places that are a distance of 125 miles from a seaport in Ireland?—If you go into the interior of Roscommon you would supply the whole of that county and Mayo with coals from Dublin at the maximum rate.

1499. That would not be so, would it, if vessels came to the other side?—No; but you could not carry on the trade from the two ports. I am assuming that you have the entire trade from one port, Dublin. The freights to the other ports, that is, to Sligo and Ballinna, Westport and Galway, would be much higher, because there is no return freight and no trade of

sufficient importance to induce parties to send the coal there. I assume therefore that the whole of the districts with which I am most familiar would be supplied from Dublin, and at the present charges on the coal, taking them altogether, they could afford to have them delivered at Dublin at about from 11*s.* to 12*s.* a ton. Then I say that all over the system of the Midland Great Western, and the Great Northern and Western, the maximum rate should be 5*s.* a ton, and that would make 16*s.* a ton.

1500. (*Lord Donoughmore.*) Take Galway; what is the ordinary price of sea-board coal there?—It is sold there at prices ranging from 22*s.* to 26*s.* a ton.

1501. Is it carried to Galway by ship?—Yes.

1502. What did you say was the governing price in Dublin?—From 11*s.* to 12*s.*

1503. (*Mr. Roebuck.*) What is the reason of the difference in price?—The fact is that it is in the hands of a few persons, and they can charge any price they like in Galway.

1504. (*Lord Stanley.*) There is no very great demand, is there?—No.

1505. (*Mr. Roebuck.*) As I understand it, it is not that the cost of carriage is so much greater, but it arises from a monopoly?—Yes.

1506. (*Chairman.*) With regard to Dublin itself, where you say coals can be obtained at from 11*s.* to 12*s.* a ton, is the consumption very large?—Yes; they burn nothing but coal there.

1507. Is coal consumed by all classes?—Yes; there is very little turf burnt by the poorer classes, and practically speaking coal is the entire fuel.

1508. (*Lord Donoughmore.*) Is the consumption of coal in Dublin very much larger than it is in the towns where the cost is a little higher; I mean in proportion to the population?—Yes.

1509. (*Mr. Roebuck.*) Take Cork, for instance; will the price of coal be very much higher there than in Dublin?—No; I think that there is very little difference in the freights to Cork, 1*s.* or 1*s.* 6*d.* Cork supplies a large portion of the southern districts with coals.

1510. You stated a short time back that the difference in the price of coal did not arise from the difference in the cost of carriage but from monopoly. I wish to know why the cost of coal in Cork is the same as it is in Dublin?—I believe there is a difference in the cost at Cork.

1511. Can you explain that?—There is more competition in the coal trade at Cork. It is a much more considerable port than Galway; they can get freights at lower rates from the coal districts, for instance, from South Wales and England.

1512. Have you any knowledge of what it costs the steamboat companies to place coals in the ports of the West Indies?—No, I have not.

1513. (*Mr. Ayrton.*) Do you know what the freights are from the coal ports in England to the different ports on the eastern coast of Ireland and on the south coast?—No; I only know the freights to Dublin.

1514. (*Mr. Horsfall.*) Can you account for the fact, that when grain is shipped from Drogheda to Manchester by a person resident at Drogheda the cost of transit is 2*s.* 6*d.* a ton less than when it is shipped by a person in Liverpool?—I do not know how that is.

1515. (*Mr. Hamilton.*) I understand your proposition to be, that there should be a uniform rate of ½*d.* a ton per mile?—Yes.

1516. Do you believe, with the gradients you have described, that that rate would be remunerative to the railway companies?—I have no doubt about it.

1517. Do you think they would get full train loads? Yes.

1518. What loads would an engine take over such gradients?—They could take 35 waggons containing five tons a waggon, the weight of a waggon being three tons and a half.

1519. How many waggons would be drawn?—35 waggons.

1520. What weight altogether would that be in the train?—315 tons.

1521. It is your opinion than an engine could draw that load over such a gradient as you have described?—Yes, it could.

1522. (*Capt. Galton.*) You have stated that the objection of the directors to lowering the tolls was that they were afraid they should lose so much of their then income?—That referred to a general reduction of the rates.

1523. Because when you opened a new piece of line, for instance, that to Sligo, could not you carry at reduced tolls upon that line?—Not very well, because if you charge to one district where there is a line less than to another you create great public dissatisfaction, and in practice it is never done in the trade.

1524. (*Mr. Roebuck.*) Suppose that the change had been made in the rate charged upon the coal only, do you think that there would then have been a loss to the company?—I do not think that there would.

1525. If they had introduced an alteration in the rates piecemeal, you do not think that the loss would have arisen which you originally supposed would arise if the reduction were made at once?—No, I do not think it would.

1526. Did you ever try to persuade your directors to do that?—Yes, in coal rates.

1527. And they refused, did they?—Yes, they refused to make any alteration in the shape of 50 per cent. reduction in the rates; such a suggestion frightens the directors, and they do not like it.

1528. (*Chairman.*) Have you found it to be a common opinion among them that the traffic of Ireland is incapable of any material increase?—Yes, and that is the great difficulty that we have to contend with. What they say is, there is a fixed quantity of traffic, and no reduction of rates will increase it.

1529. (*Mr. Roebuck.*) And that fixed quantity they can carry?—Yes. They do not think it worth their while to make a reduction and try the experiment; they think that it would be simply to give so much money to the public. When I went to Ireland first I found that potatoes were carried from Galway in large quantities by vessels at rates which I thought would pay the railway companies very well, but upon making inquiries I found that they were charging 17*s.* or 18*s.* a ton from Galway to Dublin.

1530. (*Mr. Glyn.*) When you proposed to your directors to reduce the rate to ½*d.* a ton per mile, did you make any calculation as to what increase of trade there would be to recoup them for that?—Yes.

1531. What do you think that would have been?—My own calculation was that the effect in a year would be to increase the traffic tenfold.

1532. What would the increase be in tons?—I think that the increase would be 2,000 tons a week from 200 tons, and I believe that in that case it would supersede the use of turf at all the stations. Of course I am supposing a very much better system of management of the coal trade generally, and that the sale of coal, which is nothing in Ireland now, should be carried on as it is at English railway stations. You send to a railway station here to get a ton of coals, or say five hundredweight, as the case may be, but in Ireland a man is entirely at the mercy of the merchant, who charges a large price for it, and therefore, practically speaking, it is not used by the poorer classes at all or only by a few; but then every class living within five or six miles of a railway station in Ireland could go to a railway station, and being sure of getting a hundredweight of coals for 1*s.*, that is at the rate of 1*l.* a ton, would use no turf at all.

1533. Do you really think that the consumption of coal would increase in the manner you have suggested?—Yes, I believe so; with such a system of sales.

1534. But upon that line of railway only?—Yes.

1535. (*Mr. Roebuck.*) Did you suggest to the railway directors that they should become coal merchants?—Yes.

Mr. W. Forbes.
10th May 1865.

1536. Did they listen to your suggestion?—They would not entertain it all. I was anxious that they should do as is done on the Great Northern Railway, that is, that they should establish depôts and sell the coals themselves, or if they would not do that that they should enter into arrangements with the coal proprietors either in Wales or in the north of England and sell the coals, but they declined it.

1537. (*Mr. Ayrton.*) Is the foundation of your view this, that a peasant would buy coals at 1*l.* a ton at a railway station within a distance of six miles in preference to using turf at his own door?—Yes.

1538. Will you be good enough to state how the present rates charged upon railways prevent his arriving at that point in the greater part of Ireland. If the coal is delivered in Dublin at 12*s.* a ton, and the rate is ¾*d.*, how is it prevented?—Because he would not get a supply; he would go to a station, but he would find no coal there.

1539. But how does the railway rate prevent that result being arrived at. You say that coal is to be sold at 12*s.* a ton, and that the railway rate is ¾*d.* a ton; how far will it go inland?—At the present rates it does not go; there is no coal trade there at present.

1540. How far would it be carried inland before the price became 1*l.* a ton, the rate of carriage being ¾*d.* per ton per mile?—About 50 miles.

1541. Do you find that within that distance of Dublin coal has superseded the use of turf?—No.

1542. (*Mr. Roebuck.*) Is not that because you have never carried the coal?—The trade does not exist, in consequence of the absence of these facilities; you cannot get persons to establish coal depôts over large districts of country unless there is some probability that the railway companies will carry it at moderate rates. The lowest rate that has been quoted is this, one firm endeavoured to establish a trade at ¾*d.*, but they could not do it.

1543. You begun with ¾*d.* a ton for carriage, and then to deliver at 1*l.* a ton within 50 miles from the port. Why did not that supersede the use of turf?—Those were the South Wales coal proprietors who went into the subject, and endeavoured to induce the directors both of the Great Southern and Western and the Cork line, and the Midland Great Western Company, to adopt the system that was practised in England of selling the coals at the stations, but the result of all their negotiations was that they could only induce them to adopt a rate of ¾*d.* a ton per mile, and then only the Midland Great Western Company. They tried it for a short time, and then they found that they had to maintain an establishment in Dublin, and the expenses which they had to incur altogether for the small trade which they could do within a short radius of Dublin did not pay them, and they abandoned it.

1544. (*Mr. Ayrton.*) Why should not any persons in Dublin receiving the coal at 12*s.* a ton take advantage of this rate and carry on the business, why should they go to Wales to find a person to direct the business?—Because you would deal there with the coal owners, while in the other case you would deal with middle-men, adding of course to the expense.

1545. If you delivered coals only 50 miles from Dublin at ¾*d.* a ton per mile, there would be a large margin to cover the expense; there would be a margin of 5*s.* per ton out of 20*s.*?—No, not so much as that, I think.

1546. (*Chairman.*) Would there be terminal charges in addition to the 12*s.*?—Yes, of 6*d.* at each end.

1547. (*Mr. Roebuck.*) Supposing you could only carry the coal 50 miles over a railway, would not the trade be so small that it would not be worth any man's while to take it?—Yes, and that is the reason why it broke down. The sale of the coal at places within a radius of 50 miles from Dublin did not justify them in carrying it on.

1548. And that accounts for its not being carried on?—Yes.

1549. (*Capt. Galton.*) You have stated that a reduction to ¾*d.* a ton had the effect of increasing the consumption 25 per cent.; how long did it take to recoup the company?—In the first year it increased to that extent.

1550. (*Chairman.*) Did it go on increasing subsequently to that?—No, it is still at that.

1551. (*Lord Stanley.*) Your opinion is, that if the great railway companies of Ireland could make up their minds to incur a loss for two or three years, they would be certain to recover the loss at the end of that time?—Yes, I believe so.

1552. And that might take place without any interference by the Government or any assistance from the State?—Yes, that would be the result, that the companies would lose for two or three years their dividends, but I think that that is a proposition which no railway company would ever accept. It is not reasonable to expect them to make such reductions without external aid.

1553. With regard to a reduction of fares, it would seem that all that is required is, that the directors of these railway companies should understand their own permanent interests better than they do?—Yes, I think so. If I was the owner of railway property in Ireland I should not have the least hesitation in reducing the fares to the extent of 50 per cent., although it would be attended with an absolute loss for two or three years.

1554. (*Mr. Roebuck.*) That loss during two or three years, I understand you to say, would arise if the reduction were made at once?—Yes.

1555. But if it were made piecemeal, that loss would not arise?—In the case of the passenger fares you could not do it piecemeal.

1556. Then take the case of the coals first; there would not be the same loss then?—No.

1557. After that, in the case of the passengers, would there be a loss?—Yes, on passengers there would certainly be a loss, that is, 50 per cent. of the traffic.

1558. You are of opinion that in Ireland there would not be a sufficient increase in the number of persons travelling at the low rates to recoup the companies until two or three years had elapsed?—Not for three years at least.

1559. Would that be so in England?—No; at least I do not know whether it would be so in England.

1560. Have you any knowledge of attempts having been made by the railway companies in that direction to recoup themselves?—No, I am not aware of a case.

1561. (*Chairman.*) Is there any other description of traffic besides coals upon which you think a very large increase might be effected by a reduction of the charges?—Yes, it appears to me that the theory—for after all it is a theory—that the entire traffic of the country, goods, cattle, and everything else, might be increased, is correct.

1562. You look upon coals as a most important article of traffic?—Yes, that is a very important thing, but not the most important.

1563. Will you mention some other descriptions of traffic?—With regard to cattle, which is very important in Ireland, it is a matter of fact that they carry none of the store stock at all; the fat stock comes, of course, because they cannot walk them by the road for the distance, except that which is brought over to the English markets by the jobbers.

1564. Do you think that that cattle traffic might be carried by railway if the rates were made low?—Yes.

1565. (*Mr. Glyn.*) What are the rates at the present time?—Until about three months ago there was a uniform rate of 6*d.* a waggon a mile, but latterly they have reduced it to 6*d.* for the first 50 miles, 5*d.* for the next 25 miles, and 4½*d.* for any distances beyond that.

1566. Has that led to any increase in the traffic?—It has not had time yet to work.

1567. What proportion does that rate bear to the rate charged in England?—It is the maximum rate.

1568. (*Capt. Galton.*) Do you mean the maximum rate allowed by their Act?—No; as compared with the rates charged by the English railway companies it is the maximum rate charged, the highest rate.

1569. (*Mr. Horsfall.*) Can you state what proportion of the dividend on the principal railways in Ireland is derived from the passenger traffic, and what proportion is derived from goods?—The dividend is derived of course from the entire traffic.

1570. Yes; but have you calculated what proportion of the dividend is derived from goods, and what proportion from passengers?—I confess that I do not quite understand that question.

1571. (*Capt. Galton.*) What proportion of the total receipts is derived from the one and the other?—The dividend is derived from the gross traffic, and I have never ascertained what proportion is due to passengers, or what proportion is due to goods. I can give you the difference in the earnings on each class of traffic.

1572. (*Mr. Horsfall.*) Have you made any calculation as to what proportion of the dividend is derived from goods, and what proportion is derived from passengers?—I think it is in about equal proportions, half and half, on the Midland Great Western system.

1573. (*Mr. Ayrton.*) Do you mean that the net profit on the passenger traffic is half the receipts, and that the net profit on the goods is half the receipts?—Yes, as nearly as possible.

1574. Have you made any calculation as to the cost of driving store cattle for 50 miles over the roads, and the cost of carrying them by railway?—I have been in communication frequently with large farmers and landed proprietors who have attended at Ballinasloe fair, and they have always assured me that at a rate of 3*d.* a waggon a mile they would put all their store cattle on the railway instead of driving it along the roads; that would be a reduction of 50 per cent. exactly.

1575. (*Chairman.*) For how short a distance would it be worth their while to put their store cattle on to a railway?—I think for a distance of 20 miles.

1576. (*Mr. Roebuck.*) Supposing they made that experiment in addition to the experiment in the coals, which you said would be attended with no loss, do you think the companies would be liable to a loss?—Yes, certainly, it would extend over some time. I think there would be a loss upon the general traffic.

1577. (*Capt. Galton.*) You think it would take some time before they became accustomed to use the railway for the cattle?—Yes, it takes a long time in Ireland to let the public know that these facilities exist for them.

1578. (*Chairman.*) Is the general traffic in miscellaneous goods capable of considerable increase?—Yes. I think that if my former proposition, which was a reduction of 50 per cent., were carried out, it would involve an entire loss to the directors for three years, and then that it would gradually recoup the railway companies.

1579. (*Lord Stanley.*) Have you at all considered how a charge of that kind could be introduced under the circumstances of the railway companies, there being many shareholders who probably do not intend to hold their shares permanently, and who would therefore be subject to a loss of their whole profits for three years, while the ultimate gain would be not more than would make up the temporary loss?—I do not think it is at all practicable to effect such a reduction as 50 per cent. without some guarantee to the companies, for although it might be urged by a strong body of the proprietors, and the directors carried it out, at the next half-yearly meeting the directors would be all turned out, if it involved loss at first, as it certainly would.

1580. (*Lord Donoughmore.*) You do not think that the directors are to blame?—No. Without some guarantee, they cannot be blamed for not trying experiments that might be failures.

1581. (*Mr. Ayrton.*) You propose that the earnings of a full waggon should be 3*d.* a waggon?—Yes per mile.

1582. Have you made any calculation as to what the expense of conveying loaded trains at so much per waggon would come to, taking into account the probability of bringing back empty waggons?—Yes.

1583. What is the result of that calculation?—That upon a distance of 126 miles if you can earn 1*l.* 5*s.* it will pay you well.

1584. How do you arrive at that conclusion in detail?—In this way: I take the gross earnings, and the loading of a waggon, that is, I take the average load and the receipt upon every waggon running for a distance of 126 miles, and so I have arrived at the result.

1585. What would be the average number of waggons in a train?—About 30; and I have found that upon a distance of 126 miles the average earnings of each waggon or the average receipt was about 1*l.* 2*s.* 6*d.*, therefore I think I may assume that that being the average earning of the waggon for miscellaneous merchandise, or for any class of traffic, cattle or anything, if you can, over a distance of 126 miles, earn 1*l.* 2*s.* 6*d.* you will be well paid.

1586. Will you explain how that is worked out; how do you arrive at the dividend?—That was at a time when the line earned a dividend of five per cent.

1587. (*Mr. Roebuck.*) What would be the actual cost to the railway company of running a train 126 miles?—About from 2*s.* to 2*s.* 6*d.* a mile.

1588. (*Mr. Ayrton.*) For the whole train?—Yes; that includes the original outlay and everything.

1589. (*Chairman.*) You include the original outlay?—Yes, we do.

1590. (*Mr. Ayrton.*) Taking as a basis 1*l.* 2*s.* 6*d.*, can you from that explain the mode in which, upon some estimate of the cost, you have deduced a profitable return to the Railway Company?—I took it at the time when the line was earning 1*l.* 2*s.* 6*d.*, and returning a dividend of five per cent.; what I mean is this, that on the distance of 126 miles the earning of a waggon was 1*l.* 2*s.* 6*d.*, and I think that if you can earn over a distance of 126 miles, for a waggon of goods or cattle, or any other description of goods, 1*l.* 2*s.* 6*d.*, you will be carrying at a fair profit to yourselves.

1591. You have not worked out any calculation apart from that?—No; that was my process.

1592. (*Mr. Roebuck.*) Taking it as you say, that a waggon earns that sum of money running over 126 miles, what would be the cost to the company for running a waggon that distance?—The cost would be in the same proportion, a thirtieth part, or about 2*s.* 3*d.* a mile.

1593. That would be the real cost to the company?—Yes.

1594. And all above that would be a real gain to the company, according to the sums you have mentioned?—Yes.

1595. Between 2*s.* 6*d.* and 1*l.* 2*s.* 6*d.* would be an entire gain?—No.

1596. You first of all state that by running a waggon 126 miles the gain is 1*l.* 2*s.* 6*d.*?—No; the receipt.

1597. Then call it the total earning?—Yes.

1598. What I want to know is, what the cost to the company is, of running that waggon that distance?—That would form a part of the whole 30 waggons that would be conveyed at about 2*s.* 3*d.*, you cannot divide them.

1599. (*Mr. Ayrton.*) How do you arrive at this, that 126 miles is the average run over the Irish railways, especially on the Midland Great Western?—I did not say that it was the average run.

1600. You have stated that your calculations were

Mr. W. Forbes.
10th May 1865.

made on the assumption that a train ran 126 miles ?—Yes.

1601. If that is correct, ought not 126 miles to be the average run of a railway ?—No, I do not think so ; I took 126 miles at that time because it was the longest distance.

1602. How did you get at the distance of 126 miles ?—It was the distance from Dublin to Galway, and it was our maximum distance then.

1603. That would be from one port to another port ?—Yes.

1604. And you would come into competition with the sea carriage at the other port ?—No ; there is none at Galway.

1605. But that is the extreme limit to which the railway can run ?—Yes.

1606. Then you have referred to a state of facts applicable only to Galway, where there is little or no traffic ?—Yes.

1607. How would that be a basis by which to regulate the whole operations of railway companies when it appears to be only an extreme case, the extreme limit of a railway at a place where there is no great traffic ?—I can take the mileage proportion of 1*l.* 2*s.* 6*d.*, and I will suppose that a waggon is run for 60 miles, and if you get 11*s.* for that you are well paid.

1608. In the same proportion for any line ?—Yes, for a distance not less than 50 miles.

1609. (*Chairman.*) You say that a train per mile costs about 2*s.* 3*d.*, what is included in that, the waggons and the locomotive power ?—Yes, and everything.

1610. Is anything included for permanent way ?—Yes, and the general charges.

1611. (*Mr. Hamilton.*) On some of the English lines of railway the cost is materially less, is it not ?—Yes.

1612. As low as 1*s.* 8*d.*, is it not ?—Yes. We worked the Great Northern and Western for the first 32 miles for 1*s.* 6$\frac{3}{4}$*d.* per train mile, that was given to us under an award of Mr. Hawkshaw the engineer, and when a further section of the line to Castlebar was opened we went before him again, considering the sum that he had awarded was too little, and he gave us 2*s.* It is now worked for about 1*s.* 9*d.* per train mile for the entire distance.

1613. (*Lord Donoughmore.*) Does that pay the Midland company ?—Not for the working only, but then it is a feeder to our main line ; the majority of the traffic is to Dublin ; it is between that and Dublin, and the consequence is that it forms a feeder to our line, and that is no doubt a very considerable element in the calculation.

1614. (*Mr. Ayrton.*) I presume you would not enter into a contract on the part of one company to work a line for much less than 2*s.* 3*d.* ?—No, from 2*s.* 3*d.* to 2*s.* 6*d.*

1615. (*Chairman.*) You would, I suppose, be obliged to run trains with fewer than 30 waggons ?—Yes.

1616. Would 1*l.* 2*s.* 6*d.* apply to small trains, trains consisting of 10 or 12 waggons ?—I took that as the average.

1617. (*Lord Donoughmore.*) I believe the Midland Company has a canal running alongside of it from Dublin to Mullingar and to Longford ?—Yes.

1618. That canal is the property of the railway company ?—Yes.

1619. What are the rates upon the canal ; are they the same as the rates on the railway ?—The canal is not worked at all now, or only to a trifling extent by grain owners.

1620. Is no coal carried upon it ?—Very little.

1621. No turf ?—Yes, a little turf is carried, and also some grain, to the towns that it touches, but there is no public carrier upon it, and no general traffic.

1622. It is the policy of the Midland Company, is it not, to restrict the traffic on the canal as much as possible ?—They have ceased to work it because there was not traffic sufficient for the two.

1623. The Great Southern and Western Company are in a different position, are they not ?—Yes, they compete with the Grand Canal.

1624. They have a canal which runs alongside of their rail for a considerable distance, which they do not own, but which competes with them ?—Yes.

1625. Has that competition at the points where the competition exists had the effect of lowering the rates on the Great Southern and Western line ?—Yes, it had that effect, but in the last two or three years they have come to an agreement, and they work on differential rates.

1626. (*Mr. Roebuck.*) You have stated that a single carriage earns 1*l.* 2*s.* 6*d.* running 126 miles ?—Yes.

1627. I want to ascertain what that single carriage costs the company running it 126 miles, and I have made this calculation, taking 126 miles at 2*s.* 6*d.*, say that that is equal to 15*l.* odd, divide that by 30, and that gives for each carriage 12*s.* ?—The earning of 1*l.* 2*s.* 6*d.* is the average of every waggon that ran into Galway, that is the net receipt upon every waggon that ran into Galway.

1628. Not the net receipt ?—No, the gross receipt, and that waggon may go in as one of 30 or as one of six, I could not quite precisely answer the question.

1629. (*Mr. Hamilton.*) You ought to be able to answer that question, because you have given the cost per train, which you put at 2*s.* 6*d.*, and if you take the number of carriages of which an average train consists, you ought to be able to give the actual cost of each carriage. The difference between the earning and the actual cost is, of course, the net receipt ?—Yes.

1630. (*Mr. Roebuck.*) You have stated that 1*l.* 2*s.* 6*d.* is the average earning ?—Yes.

1631. What is the average number of waggons in a train ?—Into Galway I think it is about 20.

1632. Then supposing you divide by 20, that would make the earnings larger ?—Yes.

1633. Do you adhere to that statement ?—Let me take a train of 20, that would earn about 22*l.* ; the cost of that would be 15*l.*, which would leave an earning upon that of 7*l.* to the company.

1634. (*Mr. Ayrton.*) Have you any accurate knowledge of the number of loaded trucks which go from Dublin to Galway daily, right through, a distance of 120 miles ?—Yes, there are about 10 which go through from Dublin to Galway.

1635. By how many do you think that would be increased by a reduction of fares ; how many trucks ?—I think it should be doubled by a reduction of 50 per cent. upon the rates.

1636. What would the increase be mainly composed of ?—I think potatoes would be carried, for I may mention that I was in the county of Galway about six weeks ago, and I found that they were selling potatoes at 3*d.* per stone within 10 miles of a railway station, whereas the price of potatoes in Dublin was at that time 7*d.* per stone ; and I think that if they carried potatoes at a very moderate rate on the railways, they would carry an enormous quantity of them into Dublin, and also for the English markets. I also think that there would be a very much larger interchange of traffic between all the ports of Ireland and England if there were more moderate rates charged.

1637. Can you mention any other articles besides potatoes ?—I should say general agricultural produce.

1638. What would you call it ?—The west of Ireland produces grain, potatoes, bacon, poultry, and eggs ; there is a large trade to be developed in these commodities.

1639. (*Capt. Galton.*) Where does the grain that is consumed on the Midland Great Western line come from ?—From the districts about Sligo, and from up to Longford ; that is a distance of about 56 miles. The port of Sligo supports that district.

1640. Is that grain imported into the port of Sligo? —Yes.

1641. (*Mr. Ayrton.*) I was asking you about the increase of trade between Dublin and Galway ?—I

think there would be an increase in trade in manufactured goods from England. I think that if a poor man has a pig to send to the English market, or instead of what he is doing now, growing his own potatoes and eating them, you put that man in the position of being able to send his produce to the English market, he would be in a much better position than he is now. He would be able to spend more money, and that I think would cause a very large increase of traffic.

1642. What would the advantage be of his not eating his potatoes, if he required them for food; why should he send them away ?—If he could get a larger price for his potatoes by sending them away, I think it is simply common sense that it would be better for him to do so.

1643. Would not the potatoes still be the cheapest article of food he could get, whether he could send them away or not ?—Yes, I dare say they would.

1644. There would be no motive for sending them away ?—Yes, I thing there would ; for instance, and this brings me to another branch of the subject, which is a system of through rates between England and Ireland, there is no doubt about it, that if a man had any of that small produce to send to market he would send it ; he would send to England, to Liverpool, or to Manchester, or to places where good prices are to be obtained ; he could easily ascertain what it would cost him ; but at the present time that is the great drawback, that a man cannot send anything—by the existing means of transit from Ireland into England and the manufacturing districts the rates are prohibitory.

1645. (*Mr. Glyn.*) Do not through rates exist now between the manufacturing districts of England and the ports of Ireland ?—Within the last year and a half they have been in existence on the Midland Great Western line, but to a very small extent.

1646. (*Chairman.*) On what articles are there through rates ?—Generally almost upon everything but cattle. They have through rates from the principal stations upon the Midland Great Western, and the Great Southern and Western and other Irish systems, in connexion with the London and North-western and other lines of railway ; but the great difficulty has been this, that the Irish Railway Companies will not agree to a mileage division of the rates ; they say that they are acting upon this principle, that there is only a fixed quantity of traffic to be carried, and that no increased facilities which can be given will develop that traffic further, and therefore they decline to reduce their proportion of any through rate. Take this case as an example ; suppose the rate for eggs to Manchester from Ireland to be 40*s.* a ton ; the Midland Great Western rate is 20*s.* a ton; a through rate of 30*s.* would secure the traffic and very much increase it, and the London and North-western Company would agree to a mileage division of the rate, but the Midland Great Western Company say no, we will have our rate, and there is no object in making these through rates ; we will not participate in the reduction of any through rate ; you may make it if you choose, but it must be at your cost.

1647. (*Mr. Glyn.*) Does not that apply generally to other cases ?—No ; on the Northern system there is more competition.

1648. But through rates are more general, are they not ?—Yes.

1649. (*Mr. Ayrton.*) Can you give the Commission any particulars with regard to any applications that have been made for through rates, and which applications have been rejected ?—These applications are made daily for through rates from everybody.

1650. I mean through rates upon the Irish lines of railway, the applications for which have been refused ?—The directors will not agree to any system of through rates unless they get their full local proportion of the rate, which of course is much more than they would be entitled to under a division according to the mileage.

1651. Can you give any particular cases in which applications have been made by any of the companies in England to any of the companies in Ireland asking for through rates ?—The London and North-western, the Manchester, Sheffield, and Lincolnshire, the Lancashire and Yorkshire, and the Great Northern Companies have been for the last seven years pressing upon the Irish Companies, the Midland Great Western, and the Great Southern and Western, to come into such an arrangement, and they have only just succeeded, after great negotiations with them, in inducing the Irish Companies to adopt a system of through rates, but they have still done it in a very imperfect manner, for the Irish Companies insist upon having their local rates, and that of course has tended to retard the negotiations ; but things are very much better now than they have been, and I think that they will improve, for they begin, I believe, to see the desirability of these through rates, the public begin to find the advantage of them, and I think the subject of through rates is very much considered now. Neither the railway companies in England nor in Ireland are responsible for the want of through cattle rates, for there is an anomalous state of the law as to the liability of railway companies as compared with steam packet companies in the transit of goods and cattle ; there are no through rates as yet, (except from Dublin in connexion with the Midland Great Western,) from the Midland Great Western or the Great Southern and Western system, for cattle, and that is mainly attributable to the fact that the steam packet companies who carry the cattle and goods between the Irish ports and Liverpool are protected by their bill of lading ; whereas if a railway company makes a rate it engages itself in the contract to carry the goods or the cattle to their destination ; but if they are lost by the act of God or by the Queen's enemies, or if they founder at sea, the railway company is liable for it.

1652. (*Mr. Glyn.*) That is, they must run the risk at sea ?—Yes, they take upon themselves the sea risk, although the steam packet companies are relieved from it. The railway companies have been in negotiation with the steam packet companies to ask them to join them in the risk, but they say no, we will not enter into it ; you must try and get a short Act to release you from the same risks from which we are relieved. A deputation waited upon Mr. Milner Gibson upon that subject only last week representing the steam packet and Irish railway interests.

1653. (*Mr. Ayrton.*) What law imposes upon a railway company the risk of the sea voyage to the same extent as upon the land ?—I cannot say, but it is the rule ; by law they are common carriers, and if they carry goods from any port in Ireland to any port in England they are not relieved from the risks that the steam packet companies are ; there is no doubt about it, for the best legal opinions have been taken upon the point.

1654. (*Mr. Hamilton.*) The steam packet companies are relieved from the risk already ?—Yes.

1655. (*Mr. Lowe.*) Are they entirely relieved; are they not liable to the extent of the value of the vessel ?—No ; she may founder or be struck by lightning, and they can make their own conditions on their own bill of lading.

1656. If they do not make any conditions are they not liable to the amount of the value of the vessel under the Statute of George II. ?—I think not.

1657. (*Capt. Galton.*) Have the sums which railway companies have had to pay under this system been very heavy ?—No ; the through booking system has only been in operation for a year and a half, and it does not exist at all in the case of cattle.

1658. But they might insure against the risk, might they not ?—No, they cannot get a general policy; they must take a floating policy ; they cannot get the other.

1659. (*Chairman.*) Does the Great Western Railway pass almost entirely through a limestone district? —A great part of it does.

Mr. W. Forbes.

10th May 1865.

1660. Is there any traffic in lime ?—No.

1661. Do you think that from the nature of the country it would be impracticable under all circumstances ?—I think so.

1662. Is there any mineral traffic except coals ?—None whatever.

1663. Is there any possibility of any such traffic being developed ?—Yes ; in the county of Cavan there are some minerals ; there are iron ores which it is said could be worked if they could get coal to them at a moderate rate.

1664. (*Mr. M'Clean.*) What quantity of coal is carried at the present time on the Irish railways ?—On some of the northern railways they carry a considerable quantity.

1665. What do you estimate the increase would be at $\frac{3}{8}$ths of a penny or a halfpenny rate for the whole of Ireland ?—At $\frac{1}{2}d.$ a ton. I have not studied the subject as to the whole of Ireland. In the north they do import a considerable quantity of coal.

1666. (*Chairman.*) What class of passenger traffic do you think is capable of the greatest increase by adopting low fares ?—I think the third-class passengers are.

1667. (*Mr. Glyn.*) The fare now is 1*d.* a mile, is it not ?—Yes. Although Ireland is a poor country there is no such system in practice, except on the northern lines, as there is upon a great many other lines of railway ; in Scotland, for instance, there are third-class return tickets ; on the Great Southern and Western and the Midland Great Western they have none. They issue second-class return tickets, but no third class ; the consequence is, that the poorer class of people, for a distance of 10 or 12 miles, scarcely go by railway at all except on the market days. About two years ago they tried the system of carrying them at a single third-class fare for the double journey, and the result has been that the trains which then ran empty are now crowded on every market day ; that is on the Midland Great Western line ; and I believe that if that system was carried out every day in the week it would be greatly to the advantage of the country and for the benefit of the people.

1668. (*Mr. Roebuck.*) On the English railways third-class return tickets are issued, are they not ?—Yes, on some of them, in Lancashire they have them.

1669. (*Chairman.*) Do you think that there would be much travelling by that class of people except on market days ?—Considerably more than there is at present.

1670. Have they ever tried excursion trains on the Midland Great Western line ?—To a very trifling extent, nothing like to the extent to which they ought to be tried. Ten years ago such a thing as an excursion train was unknown, and it was with very great difficulty that the railway directors were induced to try the experiment ; but it was tried in the first instance at a single fare for the double journey, giving the people a fortnight, extending over the whole system of railways. The first train, I think, carried 300 or 400 passengers, and it gradually increased to about 1,600. They have now perhaps three or four trains running each way carrying from 1,500 to 2,000 passengers each train, but they have not tried the experiment sufficiently ; they have only run these excursion trains twice or three times in a year.

1671. Do those excursion trains run in connexion with trains bringing passengers from England ?—No, they are entirely local.

1672. (*Mr. Glyn.*) Do not the Irish railway companies issue excursion tickets in connexion with English railways ?—Yes.

1673. At low fares ?—They accept a single fare.

1674. I believe there is no passenger duty paid in Ireland ?—No.

1675. Can you state what the per-centage of the passenger duty is upon the receipts in London ; is it not five per cent. ?—Yes.

1676. That is an advantage which the Irish railways possess over the English railways ?—Yes. The Government duty for 1863 for England and Wales was 365,000*l.*

1677. (*Mr. Ayrton.*) Is the second-class accommodation in the Irish carriages generally much better than in the English carriages ?—It used to be so, but latterly they have put cushions into the second-class carriages in England.

1678. The second-class carriages are more generally used in Ireland than in England, are they not ?—Yes.

1679. Practically, the great majority of those who travel first-class in England travel second-class in Ireland ?—Yes.

1680. Therefore, practically, they are carried at a much cheaper rate in Ireland ?—No, it is $1\frac{1}{2}d.$ and something better than that per mile. I think that the average fares in England are not more than 2*d.* a mile first-class.

1681. (*Capt. Galton.*) The third-class fare in Ireland is 1*d.* a mile, is it not ?—Yes.

1682. Is that the universal rate ?—Yes.

1683. Do they issue to third-class passengers return tickets ?—On some of the Northern lines they do, but not on the Great Southern and Western, or the Midland Railways.

1684. Are there in Ireland any regular express trains established ?—No.

1685. Are you aware that the charge by Mr. Bianconi's cars was 1*d.* a mile ?—No ; but I know that Mr. Bianconi was obliged to try an experiment when he started his cars upon a new road, which I think might be tried by the railway companies ; there is a great deal to be said by the railway companies about the evils of competition, but I think that Ireland has suffered very much from the want of competition.

1686. You spoke of an experiment that was tried by Mr. Bianconi, and which you said might be tried by the railway companies ?—Yes, it was this ; whenever Mr. Bianconi started a new conveyance in a district, and he found that it was not paying, he immediately set up a competition against himself, and started another conveyance at lower rates, the effect of which was to enable him to get passengers to travel by the high-priced car as well as by the low-priced car, and by so getting people to travel by the two, to make it pay.

1687. Is the average speed upon the Irish railways the same as upon the English ?—No, it is less. The average speed of a passenger train is 25 miles an hour in Ireland, while in England it is from 30 to 35 miles an hour.

1688. (*Mr. Hamilton.*) Does that speed of 25 miles an hour include all the stoppages ?—No ; take Galway for instance, a distance of 126 miles, they take five hours to do that, say 20 miles an hour, or 25 miles an hour including stoppages.

1689. (*Chairman.*) Are the tolls reduced for passengers at harvest time ?—Not at harvest time ; but they carry a large number of harvest men from Ireland to England at the rate of $\frac{1}{2}d.$ a mile. They are carried about two months before the harvest begins at that rate, and they are carried back for about two months after it finishes ; and although the population has considerably decreased in the West of Ireland, yet that traffic has steadily increased. I believe that those men could be carried all the year round at a low rate, and that they would go for all purposes of labour over to England.

1690. There would be a sufficient inducement for the railway companies to carry those men at other times as well as at harvest time ?—Yes ; they seek employment also on railway works.

1691. (*Mr. Ayrton.*) Do you think that tickets could be issued to certain classes of people rather than charging them the general rate by a train ?—No ; but I think it affords an additional reason for the reduction of 50 per cent. which I have mentioned, that those men carried at $\frac{1}{2}d.$ a mile are steadily in-

creasing each year. I think that if they made a universal charge for third-class passengers of ½*d.* a mile, the result would be that the travelling would be considerably increased.

1692. (*Chairman.*) Have any experiments been made as to the effect of season tickets ?—Yes, but with no result at all.

1693. Have they ever been applied for ?—No. For a distance of 26 miles out of Dublin we had it in operation for 10 years, but the number was always the same, and there was no residential traffic on the line.

1694. (*Capt. Galton.*) I suppose that on the Dublin and Wicklow lines there is such a traffic ?—Yes, they have a large traffic from season tickets there.

1695. (*Chairman.*) Do you think that the railway companies run a sufficient number of trains for the accommodation of the passengers ?—No, I do not think they do in some districts ; for example, take the trains from Athlone to Castlebar, going a distance of 72 miles, there was only one passenger train a day each way, so that in point of fact it is utterly impossible for the people to use a railway, they cannot do it ; a man cannot go from one town to another sometimes in one day ; for instance, from Athlone to Castlebar, a distance of 72 miles, they cannot go there and back in a day, and the consequence is that it prevents them going at all.

1696. Did you ever recommend to your directors to put on additional trains ?—Yes, I told the directors of the Great Northern and Western line this accommodation was insufficient to develope the traffic.

1697. Was that refused on the same ground which you have already mentioned ?—Yes ; and there is no doubt about it, that one train, carrying out the notion, if it is a correct one, that there is only a fixed quantity to be carried, is the best way to carry it ; but as yet they have not tried the experiment of giving greater facilities at lower rates ; I think it is a mistake myself.

1698. (*Mr. Glyn.*) You would reduce the rates, and give more perfect accommodation ?—Yes.

1699. (*Mr. Horsfall.*) What is the population of Athlone and of Castlebar ?—I cannot at the moment state, but it is small and inconsiderable ; I think Athlone contains possibly about 7,000, and Castlebar 5,000 or 6,000.

1700. (*Chairman.*) Are there any intermediate places of any importance ?—Yes, there is Roscommon, the county town, and Castlereagh.

1701. Did you carry any milk into Dublin ?—Never.

1702. Might a traffic in that be created with advantage ?—I never had any applications for that, and I never heard of any attempt being made to try it.

1703. With regard to parcels traffic, is there any parcel traffic of any importance ?—No, I do not think there is of any very great importance ; I think it is quite worthy of attention, and that every facility should be given, but I do not think that that branch of traffic is of any importance with reference to the general principle of lower rates.

1704. (*Mr. Horsfall.*) Did you state that there was only one general train from Castlebar to Athlone ?—Only one passenger train per day.

1705. How many trains do you think the respective populations of the two towns would warrant ?—I think that if the railway is to support itself they ought to have at least three trains, one in the morning, one in the middle of the day, and one in the evening.

1706. Do you think they would pay the expense of the rolling stock ?—I believe that eventually they would, coupled with a reduction of the rates.

1707. (*Chairman.*) You think that if it was worth while to have a railway there at all, three trains a day should be run each way ?—Yes ; but all these reforms are exceedingly difficult to carry out in Ireland, from the fact of the enormous number of interests that there are, and some of them adverse interests, in the railway world. The railway system of Ireland consists only of about 1,700 miles, and it earns an income of 1,520,000*l.* a year.

1708. (*Capt. Galton.*) What are the adverse interests to which you have just referred ?—What I mean is this, that to control that very small affair, they have no fewer than 18 boards. I would contrast it with the London and North-western Company, which is worked by a single board of directors, one set of officers, and one establishment. That railway earns an income of 5,300,000*l.* a year ; it works 1,200 miles of railway, as against 1,700 miles in Ireland and an income of 1,520,000*l.* a year. The revenue in Ireland is only about one-fourth of the revenue of the London and North-western Company.

1709. Do you think it would be advantageous to amalgamate the Irish railways with any of the English railways ?—I think it would be an advantage to the Irish railways if they were taken in hand by the English railway companies, but the difficulty is to get any united action among the railway companies, which is, I think, illustrated by this, that to earn a revenue which is only equal to about one-fourth of the revenue earned by one railway company in England, there are 18 different companies in Ireland, 18 distinct sets of officers, and 18 different sets of opinions to work with, and the consequence has been that any attempt to develop the traffic in Ireland up to this time has been a failure.

1710. Do you think they would work better if they were all amalgamated in one company ?—Yes.

1711. (*Chairman.*) Do you think there is no remedy for the state of things you have described but amalgamation ?—Yes.

1712. (*Mr. Glyn.*) Would you propose to place the whole of the Irish system of railways under one board ?—Yes ; I think that it would be managed better than by 18 different boards.

1713. (*Chairman.*) You think that traffic in England has been generally better developed in very large enterprizes than on some of the smaller lines of railways ?—Yes, that has been the effect on the London and North-western line, and upon all those which it has absorbed, in my experience.

1714. (*Mr. Hamilton.*) Can you state what has been the total amount of capital which has been expended on railways in Ireland ?—No, I cannot. The difficulty of working railways in Ireland may be illustrated in this way : I will take the coast line from Dublin to Belfast ; that is in the hands of three companies ; the distance is only 113 miles, and yet there are three distinct companies concerned in it, and of course there is very great difficulty in carrying out all the arrangements, because there are different opinions and different interests to be consulted. The parties see things through different lights, and the public have suffered very much inconvenience from that state of things ; but there is another line which has been specially granted.

1715. (*Mr. Glyn.*) They work with through rates, do they not ?—Yes.

1716. And the carriages run through ?—Yes ; but as between Galway and Belfast I dare say it will be in the recollection of the Commission that a great attempt was made to make Galway a very important port, but the attempt failed, and at the same time there was a great effort made by the Belfast merchants to establish a trade in the west of Ireland, but there is very great difficulty in getting any sort of union of action amongst the different parties in Ireland. As as example, I may state that a waggon starting from Galway would take, possibly, two or three days to get to Belfast ; a journey of that kind ought to occupy only about six or seven hours, or ten hours.

1717. (*Lord Donoughmore.*) Surely the route from Galway to Belfast is in the hands of the Midland Company, at least to Cavan ?—Yes, but unfortunately there is another interest which comes in from Cavan to Clones, which is the Irish North-western Company, who are at bitter enmity with the other section of the line belonging to the Ulster Company, who have the

Mr. W. Forbes.
10th May 1865.

line from Clones to Belfast, and the consequence is, that when the Ulster Company proposed to create a traffic to the west of Ireland, the other company interpose every difficulty they can, and they thereby sacrifice the through traffic between the west of Ireland and the north of Ireland to their own local squabbles.

1718. (*Mr. Glyn.*) Do they compete in rates?—Yes, they do.

1719. What railways are in connexion with the Great Southern and Western Railway from the south?—The Waterford and Limerick Railway.

1720. With what companies do they work or have through rates?—They work with all the companies.

1721. So that in point of fact there is but one system?—Yes.

1722. (*Chairman.*) The Waterford and Limerick Company are not on good terms, are they, with the Great Southern and Western Company?—No, they do work through.

1723. (*Mr. Glyn.*) Do they book through?—Yes, but the Great Southern and Western Company makes its arrangements entirely with reference to its own convenience, and the Waterford and Limerick Company, entirely with reference to its traffic from Waterford to Limerick.

1724. You think that all that would be cured by amalgamation?—Certainly.

1725. (*Mr. Hamilton.*) You think it would be very desirable to amalgamate all these Irish railway companies, so getting rid of the 18 boards of direction and placing them all under one superintendence?—Yes.

1726. Can you suggest any mode by which that amalgamation could be brought about?—I think there would be no difficulty about the railway companies amalgamating if they could be brought into a frame of mind to do it; otherwise I could not suggest any means.

1727. (*Mr. Horsfall.*) Have you considered the railway system in Ireland with a view to any action on the part of the Government, and with the object of improving the system?—I have formed what might be considered perhaps a very crude idea upon the subject, and it is this, that if any law could be passed to compel the railway companies to reduce their rates, a guarantee should be given in some shape to the railway companies, take for example their best year's income, and induce them to reduce the rates 50 per cent. and let the deficiency, if any, for a period of years, say three, four, or seven years, be recouped to the company, or guaranteed in these proportions, a third by the Government as having an interest in Ireland, and for the benefit of the country, another third by the railway companies, and a third to be raised by local taxation on the baronies.

1728. (*Lord Donoughmore.*) How would that proposition to raise a third by local taxation do you think be received by the people of Ireland?—They would object to it very strongly, no doubt, but it would be only asking those gentlemen who complain of these high rates to back their opinions to that extent, and to submit to a very slight tax for a time.

1729. (*Capt. Galton.*) Suppose that at the end of three years the railway company's receipts increased considerably, and they realized a higher dividend, should they not then be called upon to pay the whole of the amount?—Yes. If in the following three years, by increase of traffic, they got back to their dividend, I think they should pay back the tax.

1730. (*Lord Stanley.*) Do you think it is any part of the business of the Government to assist railway companies in carrying traffic below the cost price?—I confess that as to railway enterprise generally I do not think it is any part of the business of the Government to interfere with it; but I think that the case of Ireland is quite different, and that perhaps something ought to be done for it.

1731. (*Mr. Ayrton.*) What is the difference in Ireland?—The country is very much poorer than England, and I do not think they can afford to make the experiment without assistance.

1732. The question put to you was, whether it was any part of the business of the Government to assist railway companies in carrying traffic at less than the cost price, quite apart from the question of experiment?—I do not think it is.

1733. (*Mr. Glyn.*) Do you think that the railway proprietors would like to run the risk, as you have suggested, for a period of three years?—I am sure they would not, although a great number of the railway proprietors complain that the railway directors have not sufficient enterprise, and that they will not charge low rates, and give increased facilities to the public; but I would like to ask those gentlemen whose property would be benefited if these changes were made, whether it would not be worth their while to back their opinions by paying a slight tax to make up the deficiency that might arise.

1734. (*Mr. Ayrton.*) The line from Athlone to Galway is guaranteed by the county rates, is it not?—Yes.

1735. What is the opinion entertained by the people of that district? Do they ask the directors to reduce the rates, and if so would the directors decline to make the experiment?—Yes, they have done so, and the directors have refused.

1736. Although the inhabitants of the county are willing to meet any loss that might arise?—Yes; and I can put a stronger case than that: Lord Clancarty, who is a considerable landed proprietor at Ballensloe, made a proposition to the directors of the Midland Great Western of this kind, that he would personally guarantee them; if they would try a low scale of fares for a year, he undertook to pay any deficiency if any arose, any difference that there might be between the results of the low fares and the ordinary fares between Athlone and Galway, but they declined to accept the offer.

1737. (*Mr. Glyn.*) Did they assign any reason for doing so?—The reason which they gave was, that they thought it would be a dangerous experiment to try upon one section of the line.

1738. (*Mr. Ayrton.*) Have the inhabitants of Galway made any formal application to the company or to the grand jury of the county?—At almost every meeting of the grand jury there are expressions of indignation used against the Midland Great Western company.

1739. (*Lord Donoughmore.*) Have not those expressions of indignation generally had reference to the manner in which the persons present thought they were treated by the board of directors as to the guarantee?—They had; but I know also that before that quarrel arose they were always complaining that the rates were too high, and that they were not fairly treated.

1740. (*Lord Stanley.*) Do you think it would be possible to meet the difficulty in this way, without applying to any source external to the railway companies themselves;—to allow them to borrow money, being liable to repay it within a period, say, of 30 years, and letting them apply the proceeds of the loan so obtained to meeting the temporary deficiency caused by the reduction of the fares?—I think that that would be one mode of doing it.

1741. That might be done by obtaining the sanction of Parliament to such an arrangement without any assistance from the Government itself, or from any one else?—Yes; that is my opinion.

1742. (*Chairman.*) If such an Act was passed, would any of the railway companies in your opinion avail themselves of the powers so given?—I should be very unwilling to answer for the railway companies, for I do not know what view they would take of it; of course in such a case you would say that they should reduce their rates.

1743. (*Capt. Galton.*) Why should the railway companies borrow money to meet any loss arising upon a reduction of the rates, would not the loss simply have the effect of preventing them for a time paying dividends?—I believe that they would show a loss.

1744. A reduction in the rates would merely produce a want of dividend ?—Yes.

1745. Could not they pay the dividends out of capital, or rather raise additional capital to pay the dividends ?—I understood his Lordship to suggest that they should have the use of this money for a certain time, to pay up, say, in the course of three years, any deficiency, and then that the money borrowed should be repaid afterwards ; that would be to meet the temporary difficulty.

1746. (*Mr. Glyn.*) Would it not be necessary to persuade the proprietors that there would ultimately be no loss ?—Yes.

1747. (*Capt. Galton.*) You mean that it would be very difficult to persuade the directors to adopt any course like that ?—Yes, for some of them entertain very strong opinions upon the subject, and that in point of fact is the difficulty which you have to deal with. They have a fixed notion that there is a fixed quantity of traffic to be carried, and that no reduction of fares which they might make would eventually relieve them from loss.

1748. Even although new traffic should be developed ?—Yes.

1749. (*Mr. Ayrton.*) Is not the manufacturing industry of Ireland chiefly near the sea ports ?—It is principally in the north of Ireland.

1750. It is near to the sea ports ?—Yes.

1751. Then I presume that there would be little railway traffic with regard to that industry, and that any foreign trade would not utilize the railways to any extent ?—No.

1752. Passing from the manufacturing industry of Ireland we come to the agricultural industry in the interior of the country ?—Yes.

1753. There being a great preponderance of agricultural industry, is not the fruit of that industry to a large extent consumed on the ground where it is produced ?—Yes, no doubt it is now.

1754. And must it not be so, so long as there is a large agricultural population in the centre of Ireland ?—Yes, but there is no reason why, by the establishment of facilities, you should not create a manufacturing population ; take Galway, for instance, there is water-power enough there to turn all the mills in Manchester, and that is now running to waste.

1755. If Galway was the seat of manufacturing industry, would not that industry develop itself into the port of Galway, and not require any railway facilities for its development ?—Certainly not ; of course it would increase the trade of the port considerably, but then you would in that way increase the wealth of the place to an enormous extent, and of course to that extent you would increase the receipts of the railway companies.

1756. Even although Galway were converted into an active port there would still be no great communication between Galway and Dublin ?—I think there would be much greater communication, practically there is very little now.

1757. Would not one port have its own traffic and the other port have its own traffic with the interior ?—Yes ; take passenger traffic for instance, Dublin will always be the port to which Galway will find its way.

1758. I am speaking of goods traffic. If Galway became as active a port as Dublin, would the result be that there would be a largely increased traffic between Dublin and Galway ?—The effect of making it a manufacturing place would of course very considerably increase the traffic.

1759. (*Mr. Roebuck.*) Take, for example, Liverpool, do you find that the traffic is diminished between Liverpool and London ?—No ; and I think that in a similar way, any increase of manufactures in a place like Galway would have the effect of extending the traffic.

1760. (*Mr. Glyn.*) What amount of dividend does the Midland Great Western Company pay ?—In the last half year it was 2 per cent.

1761. What is the highest dividend it has ever paid ?—Five per cent.

1762. Then there has been a diminution in the amount of dividend ?—Yes.

1763. When did that take place ?—Last year, but it arose principally from a large increase which took place in the working expenditure, and from renewals of the permanent way.

1764. (*Capt. Galton.*) Have any new lines been opened ?—No, not of their own.

1765. (*Chairman.*) Had the permanent way been neglected ?—I think that they had practised economy to too great an extent.

1766. (*Mr. Glyn.*) They had not renewed the permanent way from year to year ?—No.

1767. (*Mr. Roebuck.*) Had there been any diminution in the amount of the traffic ?—Not anything very considerable.

1768. (*Mr. Horsfall.*) Does the line from Athlone to Castlebar constitute part of the Midland Great Western line ?—No, but they work it ; they contributed a third of the capital, and they work it, but it belongs to an independent company.

1769. Do you think that your plan of running more trains between Athlone and Castlebar would increase the dividend ?—Yes, I think so, and subject always to this qualification, that it would take time to do it, possibly two or three years, for, as I said before, these things always take time.

1770. (*Mr. Ayrton.*) Must not any increase of agricultural traffic arise from an increase of production ?—Yes, of course, to a very great extent.

1771. How do you propose that agricultural products from the centre of Ireland are to get to Dublin in the course of three years ?—I do not propose to confine it entirely to agricultural traffic, but, for instance, in the article of fish, nothing is done in Ireland, which arises as much from the want of these facilities being afforded as from anything else.

1772. Is not the true condition of Ireland with regard to the great mass of the country, to which there could be anything like a long line of railway carried, agricultural ?—Yes.

1773. Any increase of traffic must result from an increase of agricultural products ?—Yes.

1774. How are they to increase so as to double the traffic in the course of three years ?—I think by the introduction of coal into Ireland you might create a large manufacturing interest, and that has been proved only in the last week by the establishment of a large spinning manufactory in Drogheda by Mr. Whitworth.

1775. Spinning and the manufacture of textile fabrics have long been carried on in Drogheda ?—But those branches of industry had decayed very considerably ; it was so at one time.

1776. Do you think that the introduction of coal is the only thing requisite to develop manufactures in Ireland ?—No ; I do not think it is.

1777. Is not the absence of such industry in the main attributable to other causes ?—I do not mean to say that the other causes do not bear a larger proportion in the reason, and I do not say that coal alone is the only thing that is wanted.

1778. Is there not a great deal of water power in the centre of Ireland ?—Yes.

1779. Is not that sufficient for many branches of manufacturing industry, if there were not other causes which prevented its application ?—You cannot always compete in trade without the advantage of steam.

1780. (*Mr. Roebuck.*) I understood you to say that the difficulties in the way of transit and transport would prevent an increase of manufacturing industry in Ireland ?—Yes.

1781. If you increase the means of transit, and decrease the rates charged, you will at least create the possibility of establishing manufactures in the centre of Ireland ?—I think that they are the main essentials to the establishment of such an industry.

1782. The article of coal has nothing to do with it. what is wanted is the means of transit ?—There is a

Mr. W. Forbes.
10th May 1865.

combination of things, the coal, and the carriage of passengers and goods, and railway facilities of every sort are required.

1783. If you increase the traffic to a port, do not you thereby enlarge the market for agricultural produce; and do not you create an incentive to bring agricultural produce?—Yes.

1784. I suppose that that would be the advantage of your proposal, which would be derived by Ireland from an increase in the trade of a port like Galway?—Yes; the effect of course would be very considerably to increase the prices of everything produced, and therefore it would benefit very much the agricultural producer.

1785. (*Lord Donoughmore.*) Have any efforts been made to develop the fish traffic from Galway into Dublin and to the English markets?—There have been through rates established, and I think that they are absolutely necessary.

1786. If a moderate rate was established, do you think it would lead to an increase of the traffic?—I think it would; but not to the extent that that traffic ought to be developed.

1787. Why so?—Because of the great difficulty that is always found in dealing with the fisheries in Ireland. In Galway there is a class of men called "Claddaghmen," and they have always resisted every attempt to improve the fisheries on the west coast of Ireland. Two companies, I know, have been established, and they have found that they could not obtain labour, they have been interfered with, and they have been poached upon; and within the last 10 years, any attempts which have been made to improve the fisheries on that coast have entirely failed through the opposition offered by these Claddaghmen.

1788. (*Mr. Roebuck.*) I believe there is a large quantity of salmon caught in Galway?—Yes.

1789. How is that salmon transported to England?—The Galway fish almost entirely comes by railway; but from Ballina, where there is a much more important fishery, it is carried, although within 20 miles of a railway station, by smacks to Liverpool.

1790. (*Lord Donoughmore.*) Is that attributable to the high rates charged upon the railway?—Yes, to some extent.

1791. (*Mr. Ayrton.*) With regard to the development of the fish traffic from Galway, was there not a company established for that purpose?—Yes, several companies were established with that object in view.

1792. And they all failed?—Yes.

1793. Did they not fail in consequence of the opposition of the people in Galway?—Yes, the Claddaghmen; and every attempt that has been made of that sort has failed, in consequence of the opposition offered by those men; they have obstructed every attempt to improve the fishery; they have successfully resisted up to this time every attempt that has been made to improve the fisheries, and their own condition.

1794. (*Chairman.*) Are poultry and vegetables brought into Dublin by railway?—Yes.

1795. From what distance are they so brought in?—Poultry is brought from the extreme limits of the lines of railway, from Cork, Galway, and Sligo.

1796. Is it the fact that a great deal, taking a radius of 20 or 25 miles round Dublin, is brought in by carts?—No, not a great deal, I think.

1797. Do you think that most of it is at present brought in by railways?—Yes.

1798. Is it your decided opinion that there is no prospect whatever of the railway companies trying the effect of reduced fares?—Speaking from my own experience, I know that they are very reluctant to do anything in the way of reducing the fares, unless you accompany the proposition with an assurance that the immediate effect will be to increase the traffic. I have always found, when I have proposed a large reduction of the rates, with a view to the development of the traffic, that I have been met with this difficulty: They say, "It will not be of the slightest "use. There is only a certain quantity of traffic to "be carried, and we had better create the highest "rate for that traffic that we can."

1799. I think you have stated that the directors were justified in so viewing the matter upon the whole?—Yes; because there would be no doubt a certain loss for two or three years, which might not be recouped, although I think it would.

1800. Do you see no prospect of any change, unless there is some interference by Parliament in some shape or other?—I think not.

1801. But you have not formed any very definite idea as to what that interference should be?—Only the very crude idea which I have already expressed, that one-third should be guaranteed by the Government, one-third to be obtained by local taxation, and another third to be borne by the railway companies themselves.

1802. That is, that two-thirds of the loss should be guaranteed from other sources?—Yes; and that the companies should bear one-third themselves.

1803. (*Mr. Roebuck.*) You have excluded, have you not, the circumstance that the directors would lose in lowering the rates upon coals?—What I said upon that was, that I thought they would be repaid for any reduction they might make upon coals in about a year.

1804. But the directors seem to have the same aversion to any change in the case of coals, as in any other case?—Yes.

1805. It is not so much that they would lose their dividend, but they do not like the change?—No.

1806. (*Mr. Hamilton.*) Do you think that the railway companies have rolling stock sufficient to carry any much larger quantity of coal?—If not, they could easily increase it; at the present time they could carry a much larger quantity, I should say treble the quantity of coal, with the same rolling stock.

1807. There would be no necessity, in your opinion, for any large increase?—No. With regard to the passenger traffic, for a distance of about 50 miles below Dublin, I think I should be safe in saying that the number of passengers, taking the year round, does not exceed, in each compartment, two persons, and if they filled all those compartments they would multiply the number by nearly 20 times and that would not make any material increase in the expenditure.

1808. (*Mr. Roebuck.*) You stated that, in your opinion, the directors were not obnoxious to any blame for not reducing the rates in the case of coals?—That is their own opinion; but I thought that by reducing the rates to a halfpenny a ton per mile they would recover any loss they might sustain in the course of a year, but they were of opinion the reduction of rate would not increase the consumption of coal; you will hear a great deal of difference of opinion upon the coal question. Lord Lucan, who is the chairman of that line of railway, from Athlone to Castlebar, entertains very strong notions upon this subject. He says that it is a perfect fallacy to suppose that the Irish people will ever burn coal in the place of turf. I have formed a very different opinion, and a great number of resident noblemen and landed gentry, are also of opinion that coal supplied at about 1*l.* a ton would supersede the use of turf at their own hall doors, and elsewhere; but certainly Lord Lucan and others entertain very strong opinions to the contrary. They say that you will never induce the people of Ireland to use coal instead of turf, and that being so it is rather difficult to convince the directors of railway companies that a radical reduction in the rates charged is a desirable thing to make.

1809. (*Mr. Glyn.*) Do you think that a system of through rates in connexion with English railways would develop the traffic in Ireland, whatever there may be there?—Yes.

1810. (*Mr. Hamilton.*) But through rates would be equivalent to a reduction of the local rates, would they not?—Of course.

1811. (*Mr. Glyn.*) I understood you to say that that was your belief, if the rates on Irish railways were to be reduced to the level of those of England?—Yes.

1812. (*Mr. Dalglish.*) Who are the persons who principally complain of the mismanagement of the Irish railways; the shareholders?—I think that the complaints are almost universal, for if you take up any Irish newspaper, you will find that it is quite a popular subject, the complaining of the mismanagement of Irish railways in Ireland.

1813. What are the principal complaints that are made?—They complain of the high rates, that is the principal thing; they say that they ought to have very much lower rates.

1814. As low as they are in England?—Lower rates than those in England.

1815. (*Mr. Ayrton.*) Do you know what the cost of cartage is in Ireland?—Upon grain it is 4*d.* a mile.

1816. On common loads?—Yes.

1817. That is the ordinary cartage rate?—Yes.

1818. Is not that the proper standard from which to start before persons in Ireland complain of suffering a grievance at the hands of the Irish railway companies?—Do you mean to say that they ought to take 4*d.* a ton a mile as their basis, and that goods ought to be carried according to that on railways?

1819. If the charge by load is so much higher than that by railway, they could have no great grievance against the railway company, which charges them so much lower?—But I think that there is no sort of analogy between the cost of carriage on common roads and on railways.

1820. (*Mr. Glyn.*) Are the terminal charges in Ireland lower than they are in England?—Yes.

1821. Considerably lower?—Yes; they do not cart in Ireland at all; it is done by agents, forwarding agents as they are called; and the consequence of that is that the public suffer very much, and it operates as a great drawback to the interchange of traffic between the two countries. In Ireland there is a set of men, who call themselves forwarding agents, they are established generally in Dublin, having agents in the English ports, and if any goods are consigned to England, a crate of eggs, for instance, these men get hold of them, and the railway companies not being their own carriers in Dublin, these forwarding agents make any charges that they think proper upon the goods, and when they arrive at Manchester, for instance, the additional charges made by them amount to 75 per cent. of the railway charges.

1822. That is a matter extraneous to the railway system?—Yes.

1823. (*Capt. Galton.*) But it is the result, is it not, of not having through rates?—Yes.

1824. (*Mr. Glyn.*) It arises partly, does it not, from a want of communications at Dublin between the respective railways?—No, it arises from the railway companies not doing their own cartage in Dublin, because there is no doubt that any railway company can do its own work better than any agent can.

1825. (*Lord Donoughmore.*) You allude to Mr. Fishbourne?—Yes, and other men of that class; and their object has been not so much to develop traffic as to make as much as they can out of it.

1826. (*Chairman.*) Are there any other points upon which you wish to express your opinions to the Commission?—No.

1827. (*Mr. Ayrton.*) Is there perfectly free competition among the persons you have just spoken of, or is any preference given to one person over another?—The railway companies have no control over the forwarding agent; he does just what he likes with the traffic after he gets hold of it, unless it is delivered to him at a through rate. Mr. Fishbourne is the so-called agent of the Great Southern and Western Company; but they cannot control his movements when he once gets hold of the goods.

1828. So far as the railway companies are concerned, are persons perfectly free, if they choose to establish themselves in that business?—Yes, there is perfect freedom.

1829. (*Mr. Gower.*) You stated, I think, that you were in favour of the amalgamation of Irish railways. Would you enforce that upon them?—That is rather a difficult question to answer, but I think I would, rather than that it should not be done at all; if it could be enforced I think it should be done.

1830. Is there any amalgamation of railways in Ireland?—The Great Southern and Western Company have absorbed some of the smaller lines in the south of Ireland.

1831. (*Lord Donoughmore.*) The Dublin, Dundalk and Enniskillen line is also amalgamated, is it not?—Yes; that is amalgamated with the northern system as far as Londonderry.

1832. (*Mr. Glyn.*) Have the railways between Belfast and Dublin the power to amalgamate now?—No. I think that those powers have altogether expired. An attempt was made by some of the proprietors this year in the case of the Dublin and Belfast Junction and the Dublin and Dundalk, but it was rejected by the proprietors themselves.

1833. (*Mr. Gower.*) How do you account for there not being the same tendency to amalgamate railways in Ireland as in England?—I cannot account for it, except only in this way, that when the railway directors, say three or four boards of directors, come to discuss the question of amalgamation, they will have to consider a certain loss of patronage; there are certain fees attached to the different posts, and they do not like to lose them.

1834. (*Chairman.*) Do not these considerations arise in England as well as in Ireland?—Yes, they do no doubt, but they do not seem to have the same effect in England as in Ireland.

1835. (*Lord Donoughmore.*) The directors do not like to be dethroned, in point of fact?—No, I think that is it.

1836. (*Capt. Galton.*) In England they would have more opportunity to seek for another field?—Yes.

1837. (*Mr. Ayrton.*) Have you estimated what the annual saving would be by an amalgamation of all the Irish lines of railway?—No, I have not. Mr. Dargan has expressed some very strong opinions upon that point, but I do not agree with him as to the enormous sum which he says would be saved by amalgamation.

1838. (*Mr. Glyn.*) Have you calculated the working expenses at the present time of the different railway companies?—Yes, and I think that the average working expenses of the Irish railways at the present time is 49 per cent., and I believe that by a better system of management, by amalgamation or by a better union of interests, those working expenses could be fairly reduced to the extent of from 5 to 7 per cent.

1839. (*Lord Stanley.*) Is it not the general rough calculation that the working expenses absorb half of the gross receipts upon a railway?—Yes.

1840. That is in England?—Yes. If you are going to work or lease a line you take 50 per cent. as the fair working expenses.

1841. (*Mr. Hamilton.*) Generally speaking, it is less than that, is it not?—No, I think not; that is about it.

1842. (*Lord Donoughmore.*) Is not that what is generally allowed in common purse agreements?—Yes; on the London and North-western line I think it is 42 or 43 per cent.

1843. (*Mr. Hamilton.*) Do you speak from information which you have obtained of 50 per cent. being the usual allowance made for working expenses?—Yes.

1844. Are they not as low as 46 and 47 per cent.?—Yes, certainly it is so in some cases.

1845. (*Chairman.*) Do you think that there is a greater tendency to amalgamation on the part of railway companies in England, with a view to protecting themselves from competition, than there is in Ireland?—Yes. I believe that the absence of competition is most injurious not only to Ireland itself but to the railway interests in that country.

The witness withdrew.

Mr. W. T. Mulvaney.

10th May 1865.

Mr. William Thomas Mulvaney further examined.

1846. (*Chairman.*) You wish, I believe, to supply some deficiencies in the evidence which you gave on the last occasion before the Commission?—Yes.

1847. Will you have the goodness to state the points to which you now wish to call the attention of the Commission?—I wish particularly to show the impossibility of developing any system that may be contemplated in Ireland without a connexion with the various systems of railways that exist there in Dublin, and to which I referred on the last occasion, under the head of accessories for development of traffic; without that, no system like that of the German unions, getting the traffic from one part of the country to another, can be effected.

I also desire to call the attention of the Commissioners to the necessity of being able to make sidings and branches to places that would afford trade to a railway without the enormous cost which separate Acts of Parliament for that purpose require in England and Ireland.

Another subject which has occurred to me is the question of the supply of waggons. It has been argued in Germany that the waggons should be supplied by private parties, but the principle seems to be right and just that the railway company, who are the carriers, should provide waggons for the purpose. On that question, as an accessory to the development of traffic, I would call attention to the necessity of giving certainty to the consumer and to the producer, as to the transfer of his goods through the instrumentality of arrangements made for through rates, and without the trouble and expense of personal attention at the various places where, so to speak, the bulk is broken. In reference to the second point, the German union system and its applicability to Ireland, I omitted to state to the Commission that, in those unions so called, the waggon work is provided by the various companies of the union, who furnish for the purpose of through traffic their quota of waggons for that purpose to the common work; they arrange among themselves a tariff for the transport of goods, and they fix the rate at which each party shall be paid for its waggons in passing over the lines of another party. The arrangements on all these subjects have attracted a great deal of attention on the part of the unions in Germany; and they are all contained in a little book,* which I have fortunately found, in which the various unions in Germany are mentioned, and in which all their rules and regulations and tariffs are set forth. The rates in the German unions, as I explained before, are published, and the rates for all through traffic are known to every one; but there are special rates which are charged from time to time consequent on the development of new trades. I have had in Germany considerable difficulty in inducing those unions to adopt, as a principle, a per-centage deduction from those rates for full trains running through from fixed station to fixed station; and it seems to me that, inasmuch as it saves very great original cost to the company in the transport of goods, it might be a very great advantage if it were adopted in Ireland. It has been suggested to me that there would be a difficulty in adopting the principle of the German unions in Ireland, in consequence of their not being able to compel any intervening company or end company to join in the rates. For an island like Ireland, one would naturally propose that the whole country should be placed in one union with regard to the through traffic, but perhaps it would also admit of subdivision into sub-unions under one union for particular systems. But to meet the difficulty arising from any one company refusing to adopt what the majority of the unions was prepared to approve, it may be suggested that the decision upon such a point should be provided for by Act of Parliament, the matter to be referred either to arbitration or to the Board of Trade, or to some other properly constituted authority to decide it.

The third point to which I wish to call attention is more economical arrangements for working; and I was not before aware that that was one of the objects of this Commission. Apart from the question of low tariffs, and the principle that a mass of trade will of itself greatly economise the cost of transport, I may state that the organization of regular goods trains at fixed hours and fixed times running from one part of the country to the other has been found in Germany to have a very useful effect in stimulating the senders and receivers of goods to arrange for their being loaded in time, and furnished to those trains; and also in stimulating the traffic managers themselves to provide for the quantities to be taken by such trains, so that the locomotive which runs may have full work according to its power. The establishment of these trains has very often led to new traffic, and it is perhaps scarcely necessary for me to call the attention of the Commissioners to the fact, that nearly all railways have derived their chief profits out of the new traffic which has been created by them. In Ireland, upon the whole, I am afraid it must be admitted that very little new industry is to be expected to arise out of the present system, and it appears to me difficult to do it so long as the different lines of railway are not absolutely connected, so that the trains and carriages could run from one to the other, especially as long as the tariffs are so high as they are at the present time. With regard to the questions of direct and indirect freights, and varying and fixed rates of freight, I may observe that a fallacious principle seems to have governed them to some extent of late years in Ireland. The doctrine entertained by railway directors, that there was a fixed traffic, and that that could not be increased, has led to its natural consequences, at least in one instance, that as the traffic of passengers, owing to emigration or otherwise, diminished, the fares have been increased; and, as I have already ventured to express myself, the fares are now too high, and the natural result of that increase in the fares is proved by the dividends diminishing, and that system has naturally had the effect of starving the traffic instead of increasing it. With reference to low variable tariffs, I might perhaps call attention to this, that new markets might, in Ireland, be developed thereby. For instance, I will take agricultural produce; hay, in England and in many parts of Ireland, when I was well acquainted with that country, never exceeded from 30*s.* to 2*l.* a ton, which was the value of it in the place of its production; in most parts of England, especially in the mining districts, where they require large quantities of hay, the rates run from 8*l.* to 10*l.* In Durham it is frequently so, and in Northumberland. I am not so well aware how it stands in Lancashire, but I believe the prices there are very high; but notwithstanding this great difference in price, and I know that they can make first-class hay in Ireland, I take it that there is very little traffic in hay between the two countries. In Holland, a year or two ago, the demand for hay was so great from England, that the export of it commenced there by the introduction of one pressing machine to press the hay and prepare it for market, and I am quite satisfied that a very large and important return trade, even for the coal waggons, would be found in the various agricultural districts to be carried to a port for export, not simply in hay, but in many other agricultural products, such as roots, beans, peas, and vegetables, which go at the present time extensively to Scotland. But to enable these very cheap articles to be brought with advantage in large quantities, it is necessary, as I stated before, that the railway should come alongside the ship, and discharge these products without cost into the vessel. As an interesting result of the indirect profits arising from low fares, I may refer to the experience I gained in local agitation for reduced freights upon coal in

* Tarif-Taschenbuch, für den Güterverkehr auf Deutschlands Eisenbahnen, Von A. Rörig. Berlin.

Germany. The first consequence of it was an immediate demand for an increased quantity of rolling stock. So great was the necessity for providing waggons and locomotives, that a whole series of trades were set in motion, and these things of themselves being brought to the railways increased the transport of iron and wood, and of all the articles necessary for the manufacture of those waggons; and when I merely allude to that fact, the benefits resulting will naturally suggest themselves to the minds of the Commission. On the subject of varied rates and fixed rates, which occupy the attention of the Commission, I may say that fixed rates, however low, may nevertheless bear a certain new traffic, that appears to be essential in order to have elasticity in the question of freights as in all commercial matters. In Germany the internal traffic is taken for short distances at high rates, but they are adopting a system of a falling scale of rates for traffic in proportion as the distances increase, while for through traffic they have almost invariably much lower rates than their local traffic rates. In this way, cattle, for instance, whether dead or alive, from Ireland might be usefully brought from one station to another with a view of being taken to the great market for agricultural produce from Ireland to England; and to enable the cattle to be brought with advantage to the English market, it is probable that not only a reduced rate, but greater accommodation in regard to waggons and vessels than at present can be afforded would be necessary at lower rates. This is another evidence of the necessity for power to vary the rates. I may mention, with regard to passenger traffic, a fact which has come to my knowledge. A person in the north of Ireland, I believe his name was Roe, and he told me the fact himself, leased a railway from Londonderry to the sea. He leased it from the company for a certain number of years. There were very high rates charged upon it, and I think that the special rate for passengers that he mentioned to me was 4*s.* 6*d.* He adopted then a very low rate, 1*s.* or 1*s.* 6*d.*, at his own risk as lessee, but he immediately produced by this reduction a very vast increase in the traffic, bringing important benefits to himself. But when his lease dropped the railway direction put on the high rate again, and the traffic immediately fell off. In the same way with the harvest men who come in large numbers from the western districts of Ireland into England, the rates are charged according to the period of the year by the railway company, and with advantage for the men at the time, but after the time when the rate put on for the harvest men has passed away, they walk instead of going by the railway waggon. With regard to the question of passengers, the suggestion that I would respectfully make with regard to Ireland is that the German rates should be adopted as a maximum, 1½*d.* for first-class passengers, 1*d.* for second-class passengers, ¾*d.* for third-class passengers, and ⅜ths of a penny for fourth-class passengers. They are very nearly about one-half of the present rates; and I may perhaps be permitted to observe that without the construction of much more railway stock the change could be effected, if adopted, by adapting the present first-class carriages generally as second class carriages for the second-class passengers in Ireland, which would be precisely the state of facts in Germany; for the second-class passenger carriage in Germany is fully equal to the first-class passenger carriage in almost any part of England or Ireland, and so through the various classes.

With reference to the subject of coal, and the coal trade generally, I wish to show, simply looking at the circumstances of Ireland, what was effected in Germany by a reduction of the rates. It was conceived that because Westphalia was very rich in coal, a parallelism did not exist between the circumstances there and the circumstances in Ireland, and my object was to show that the distance from the Westphalian coal field to the districts, very often purely agricultural districts, to be supplied with coal, was not in Germany much greater than it would be from the English coal districts on the coast to the interior of Ireland. It was very nearly double in the case of Germany. I would also beg to state, in reply to a question which has been already put as to the various coal districts which exist in Ireland, and which are certainly not developed for want of railways being taken to the mouths of the pits, but I believe the introduction of English coal into the interior of Ireland would lead directly to the development of those districts. I believe that the south-western part of Ireland has not yet in any way been fully explored by making borings or otherwise to ascertain its capabilities in the production of coal. Those which are in Kilkenny, Tipperary, and Tyrone, and the north are better known.

The only other matter of interest which it strikes me to mention to the Committee, is with reference to the question of how the change, which appears to be so necessary, may be brought about without destroying the principle of private enterprise and handing the railways over to the Government to manage. With reference to that I beg to recall the attention of the Commission to what is done in Germany. The Government, as I have already stated, guaranteed the interest to the private companies, and not only so, but a system was organized in the open money market by the issue of obligations in the shape of amortisable obligations, which are payable off from time to time by lot, and very large sums of money are obtained in this way at very moderate rates of interest. In the case of the Cologne and Minden Railway, which I have at present in my mind, the government from time to time guaranteed interest upon 46,000,000 of thalers, which would be very nearly 7,000,000*l.*, and about 22,000,000 of thalers besides this were taken up in the shape of obligations by private parties in the open market, and these are regularly paid off out of each year's income from the railway; for instance, in the year 1863 the net profit on the Cologne and Minden Railway was 700,000*l.* That was devoted to the payment of interest and the redemption of those obligations; 295,864*l.* is the loan proportion; the state duty is 55,000*l.*; the reserve fund is 82,000*l.*; but through the instrumentality of this system of financing, the company were in a position to pay their own shareholders, as they stated on the last occasion, 12 and ½ths per cent. upon their subscribed capital, the total sum which they paid the shareholders being 252,000*l.* Now it appears to me that it would be possible, with reference to the debt in Ireland on the various railway companies, that either this debt might be reduced by a similar arrangement into a terminable annuity payable off by degrees, at a low rate of interest, either directly through the instrumentality of the state, or through an enactment similar to that which is so very extensively used on the Continent, not merely in Germany, but in Belgium and France. If the Irish railway system were by such means relieved of a portion of its debt, they ought,—if the directors can be convinced by the experience which has been obtained in other countries, of a certain increase of traffic arising from a reduction of the freights,—they ought either to be in a position to effect these reductions themselves, or at least it is to be assumed, that the facts being known to the public, parties would be found who would guarantee to the shareholders a minimum dividend upon the prospect of the future, so that they would be able to obtain loans for a certain number of years, and recoup themselves by increased profits for the losses which everyone anticipates, in a country situated as Ireland is, would in the first instance follow from a reduction of the freights. These are the only further observations which it occurs to me to make.

1848. (*Lord Donoughmore.*) Referring to the opinion which you expressed at the commencement of your evidence to-day as to giving further facilities to existing railway companies to make sidings and branches, I think you stated that the present system

Mr. W. T. Mulvaney.

10th May 1865.

entailed very great expense upon the companies ?—Yes, as I understand it.

1849. Will you be good enough to explain what further facilities should be given, and upon what plan you would propose to decrease the expense of making sidings and branches ?—The plan which exists in Germany is laid down by a universal railway law, that any such sidings or branches, or even a whole railway, is merely conceded by the Minister of Public Works and Commerce, after he has made the necessary investigation, almost without cost, and following his concession, which is approved of by the Crown. There is an expropriation of the land and all rights belonging to the railway system.

1850. Have the parties whose property would be expropriated by the operation of these concessions any power or right to be heard by counsel or witnesses against the project of a railway company ?—They have only a right to be heard before the Ministerial department. There are official and impartial valuators, or arbitrators, named to value the property, and upon their valuation being made the concessionaires proceed with their works, and reference is then only made to the Minister, so far as my memory serves me.

1851. Is the decision of the valuators as to the compensation which the owners are to receive final ?—Yes ; subject, in cases of dispute, to an appeal to the Minister.

1852. There is no appeal made to a jury ?—I think not.

1853. Do you think that in this country, where the people are free, and rather like to enjoy their property without let or hindrance, such a system would be borne, either in England or in Ireland ?—I think that we do bear it at present, but not certainly without an appeal. There is an organized system, and in which I took part at an early period, for the purchase of property ; it was adopted first on the River Shannon, and it is now prevalent all over Ireland, and that arbitrarily enables property to be taken.

1854. That is, after passing an Act of Parliament ?—Yes ; and I take it that that *modus operandi* for expropriating property will still continue in that country, I believe it does, subject to an appeal to the assistant barrister ; but the great question is, not the question of expropriation, but the great expense which is incurred in parliamentary contests before the Act of Parliament is granted, or it may pass through unopposed, and it will cost more money than the siding that is wanted.

1855. Are you aware that a General Act was passed last session to give power to railway companies to construct works, subject to the approval of the Board of Trade, and without an Act of Parliament in cases where they obtained the consent of all parties ?—Yes, and that might have the effect of debarring them from making those works ; whereas in Germany, when once the concession is given, then the power of expropriation from the mode of valuing that exists there follows.

1856. Before a concession is granted to a railway company by the minister, do the persons whose property would be so expropriated receive notice of the intention of the parties to apply for a concession ?—Yes ; public notice is given in the newspapers that such a concession is to be applied for.

1857. Is it anything like the notice which is given in this country, notice being personally served on each owner, accompanied by a statement of the manner in which his property will be interfered with, the quantity of land proposed to be taken, and a sketch being given of the line, as intended to pass through the property ?—I rather think that it is not in such detail, but full notice is given in the local papers, and persons who object can appear before the minister and state their objections.

1858. Is the minister assisted at all by a jury ?—No.

1859. He alone is entirely responsible, and decides according to his will and pleasure ?—No ; he decides according to the Act of Parliament, and I believe there is a general Act in Prussia with regard to the making of railways, giving powers and laying down the rules and regulations under which they shall be conceded.

1860. Do you think that any British subject would be content if a minister of the Crown, by his mere *ipse dixit*, were empowered to say that his property should be taken away from him whether he liked it or not ?—I am not competent to give an opinion upon that, but if it is not so done, the system which prevails clogs your whole railway system with enormous expense. As I stated before, as far as I recollect the statistics upon the subject, the preliminary expenses taken together for the construction of railways in this country exceed the cost of all the railways in Germany.

1861. (*Mr. Ayrton.*) In Germany, I believe, they do not object to level crossings over any road ?—They are nearly all level crossings.

1862. They do not make bridges over roads, even at the very entrance to a large town ; they do not incur that expense ?—The system of level crossings is very prevalent in Germany, and I must admit is very much subject to complaint, and I think it is generally found now, where the traffic is increasing extensively, to be injurious, and that causes them to regret that another system was not adopted in the first instance.

1863. Do you not consider that the circumstances connected with the development of the coal traffic in Germany were quite exceptional, because the country is very cold during a long period of the year, there is very little fuel, and that is extremely expensive in many parts of the country ?—No. The private consumption is a small matter in the whole affair, and it has not yet at all been worked up to the extent to which I believe it will come. Wood, I believe, is still burned from preference in Berlin and in various other towns. It is the manufacturing industry that has taken the greatest advantage of coal, besides which the collieries in Germany have been for a very long time in existence; vast numbers of them exist there, but the trade in coal was always limited from the want, I believe, of the means of transport.

1864. The cost of transport by land was so enormous that practically it limited the consumption of the coal ?—Yes.

1865. They had to rely chiefly upon wood as fuel for manufacturing purposes and for domestic consumption ?—Yes ; before the railways were introduced, although within a few miles of the coal pits they were obliged to rely on wood.

1866. Therefore the construction of railways caused a sudden increase in the consumption of coal as fuel ?—It did not do that, as I stated before, until the rates were reduced, for they burned wood in the locomotives in Bavaria, and in many other parts of the country they burned turf in the locomotives, in Bremen, and in many other parts of the country.

1867. (*Chairman.*) Would not your plan of raising money on terminable annuities add considerably to the charges upon railways at present ?—No ; my object is to reduce the cost.

1868. They would have to pay a higher rate of interest, would they not, if it was to be paid off ?—No; not a higher rate of interest, for they would be gradually paying off the interest and the principal, but I was addressing myself to the question of the rates.

1869. (*Capt. Galton.*) If you can borrow money on a permanent annuity or a mortgage bond at 4 per cent., and you convert that into a terminable annuity, must you not pay something more than 4 per cent. during the whole time that that terminable annuity has to run ?—Yes, perhaps 1 per cent. to a sinking fund.

1870. That would be a greater charge upon the railway company than the present mortgage debt, would it not ?—Yes, and of course that would be a useful stimulus to them to develop the traffic. The proportion is very large of loan and mortgage debt to the share capital in Germany.

1871. (*Chairman.*) The latter is very small, is it not?—Yes. The alteration that I would make with regard to Ireland in its present difficulties, with a debt of about ten millions on the railways, is this: if that debt, instead of paying the present high rate of interest could be converted into a terminable annuity, and either guaranteed by the State or guaranteed to be paid off in 30 or 40 years, like the Drainage Loan in Ireland, it would be such a boon as ought to induce the existing companies to make some effort to obtain the increased benefits which would be derived from low fares.

1872. (*Capt. Galton.*) But that would diminish for some time, would it not, the dividends payable upon the shares?—No, they are paying interest now which is equivalent to what would make a sinking fund and pay interest.

1873. Do you mean if the Government gave a guarantee?—Yes; if you take it at 3½ per cent. interest. I am assuming 3½ per cent. for interest, and in this particular case of Ireland, that the debt was only to pay interest for the first five years during the experiment, and that the repayment of the principal was only to commence from that day forward. It would be in that shape practically a great benefit conferred upon the present railway companies.

1874. (*Mr. Glyn.*) You would make it 4½ per cent., including the interest and sinking fund?—Yes, after five years.

1875. (*Chairman.*) Do you think that parties would be found willing to make the experiment, to raise the loans, and then run the risk, during the first three or four years, of going without a dividend?—I have not the least doubt of it in this country; I find that the English railway companies are extending their traffic into Ireland, and very judiciously so; *i.e.*, the Western companies into the south of Ireland, and the North-western from Holyhead into the north; and communications may be made from other railway companies, and these very railway companies might lease the Irish systems of railways or portions of them, and still keep up that same spirit of competition which I think is so desirable for the future benefit of the public in Ireland.

The witness withdrew.

Mr. William Oxlade examined.

1876. (*Chairman.*) Will you be good enough to make any statement you wish of the grievances of which you say you have to complain?—The first grievance that I have to complain of is, that the North-eastern Railway Company select their customers. The second grievance that I have to complain of is, that the Court of Exchequer and the Court of Queen's Bench decide differently from the Court of Common Pleas. When I bring an action at common law, they say to me, "Take it into the Court of Common Pleas, "it is under the Railway Traffic Act, with which the "Court of Common Pleas deals exclusively." The Court of Common Pleas decides in contradiction to the Court of Queen's Bench and the Court of Exchequer; and they say, "Your remedy is by action "at Common Law; there is a case which has been "decided of Johnson *v.* the Midland Railway Com-"pany, and that is your remedy, to set that judgment "aside. If we are wrong in that case, we are wrong "in all." So that I am knocked about from court to court, and get no remedy at all.

1877. I suppose you think that there ought to be some alteration in the law?—I think that if the words "undue and unreasonable" in the Railway Act were struck out of that Act, the Judges in the Court of Common Pleas would have no difficulty.

1878. (*Mr. Glyn.*) What do those words particularly apply to?—They say that the words "undue "and unreasonable" are to be considered in this way, that if the interest of the railway company is prejudiced, that would be "undue," but they do not weigh the interests of the public in one scale and the interests of the railway company in the other. In weighing the terms "undue and unreasonable," they take my trade and stop it, and they say that it is not "undue and unreasonable" to stop my trade, because it would be against the interest of the railway company to let me carry it on; and what is the case with me is the case with every one; but the difference that this makes in the price of coals to the public is 4*s.* a ton, and as far as I am concerned it amounts to taking 2,000*l.* out of my pocket, besides the stoppage of my trade, and preventing me from earning my living, and my contracts are all thrown away.

1879. Do you send your waggons to be forwarded, and do the company refuse to take them?—Yes.

1880. You tender your loaded waggons?—Yes, I tender my waggons in the usual way, and the objection that they make is, that I am not a colliery owner; that is the only objection that they raise; they say, "You are not a colliery owner, and therefore "we refuse to carry your coals."

1881. (*Chairman.*) How are you connected with the coal trade?—I have large contracts, perhaps for 25,000 tons. I purchased a colliery, or I paid a deposit upon it, and the bankers guaranteed it in one case, and I had another contract for 5,000 tons, and the railway company undertook to carry the coals so long as the coal owner made himself answerable for the charges. I pointed out to the coal owner that I was providing my own waggons, and my own men to load and unload, and pay my own men to pay and keep the accounts; that other persons had all the necessary facilities provided for them by the company, while I was charged 2*s.* more for the carriage. His answer to me was, "I cannot help that, the account is kept "in my name. I must pay it, and you must pay me." Well, I did that for sometime, but at last he said to me "I see that you are not fairly dealt with, and I "will not pay these charges," and all the reasoning that I could use upon the matter would not induce him to do so. He said, "I will not pay these "charges any more, you shall pay them." Then I go to the railway company, and I tender to them 50*l.*, and they say, "We will not take any sum from you; "we will not let you carry on your trade at all, unless "you get the coal owner to enter into an arrangement "with us, to pay us what we charge." After ten years' stoppage of my trade, Mr. Thompson, the chairman of the railway company, entered into an arrangement in writing to let me carry on my trade, that is to say, we were to shake hands, and in accordance with that I did begin again, and I made some large purchases, and got my own waggons, and upon the first consignment of coals that I sent to York they charged me 2*s.* 7*d.* per ton. I then wrote to the coal owner, and pointed this out to him, and he said that it was necessary we should go together and see the railway people, in order to ascertain whether that was the charge which they intended to make. If so, it was only a question of how many coals he could supply, 1,200 or 800 tons, and what would they charge. We met, and we went and saw the general traffic manager, Mr. Quelch. The coal owner put the question to him, and said, "You have charged Mr. Oxlade this month "for coals 2*s.* 7*d.* per ton. Is it to be understood "that that is the charge which you intend to make?" And he said, "Yes, that is the charge we have made, "and we intend to make the same charge." Next month I sent 400 tons, and the next month I think I increased upon that quantity, and I went on sending a larger quantity; they kept back the dues account for three months, and then they sent the dues account in, charging 5*s.* 2*d.* Now just consider that case. As soon as I learned what I did, and I thought that I had done everything I could do, that the charge was to be 2*s.* 7*d.*, I issued bills and sold my coals at 10*s.* 6*d.* instead of 12*s.* 6*d.*

1882. (*Capt. Galton.*) Had they not made a contract with you or with the coal owner?—No.

Mr. W. Oxlade.

10th May 1865.

1883. (*Mr. Glyn.*) When you made this arrangement with Mr. Thompson, it was an arrangement between you and the company, was it not?—Yes; so far as giving me facilities under similar circumstances. What he said was, "You are to understand "that the account is to be kept in the coal owner's "name?" I did not object to that, nor do I now if they will deal fairly with me.

1884. (*Capt. Galton.*) Was not a contract entered into when the goods manager told you that 2*s.* 7*d.* per ton was to be the charge for the future?—No; that would not be held to be a contract in law.

1885. But surely it would in a Court of Equity?—No, it is only held to be so between the coal owner and them. If I complained, they would say, "We "talked to Mr. Forster."

1886. It would be held to be a contract with the coal owner?—Yes; they would say, "We cannot "enter into litigation with a common man; you must "pay us through the coal owner."

1887. (*Mr. Glyn.*) He would not let you use his name?—No. The way in which my trade was brought to a stop was this; that was in the case of another coal owner; and my great grievance is that they pick and choose their customers; they say, "We "will carry for certain persons, but we will not carry "for you." When I meet them on the circumstances, and I get a coal owner to go with me to them and say, "Now I will do everything that you wish me to do, "give me the same facilities that you give to others;" they say, "We will not do so;" and the effect of that is that it ruins me. That applies to the Yorkshire coals, and they will not give me the same facilities as they do to others under similar circumstances. The Court of Common Pleas say, "If you are dis-"satisfied, you must bring an action at common "law."

1888. (*Mr. Roebuck.*) Can you suggest any reason why the railway company treats you in this way?—I can only suggest this, that there is a division amongst the directors themselves, and some of them are anxious to have this question settled, and they think that I am a likely person to get it settled; they have told me so, and this is so far as I am at present situated.

Ten years ago, or in 1854, Mr. Sherriff, the traffic manager, sent for me. I waited upon him by his own appointment, and Mr. Mason was the party who went with me to see him. His object was to have a share in my trade. My book stood then in this way; there were about 3,000*l.* of book debts, and I had about 3,000*l.* at my bankers. He said, "I wish to have an interest in your coke trade." I was then carrying on a large trade in Staffordshire, and I could buy a great deal more then, because I had capital to pay for it. I could sell more than I could buy for want of capital. I pointed this out to him, and he said, "Well, I will use my position in "the company's service, and see that you have an "unlimited supply of waggons." I had none of my own. He also said, "I will see that you have low "rates for carriage, and I will see that you have long "credit in the leading charges." I pointed out to him that, with all that, before I had been in the trade for six months, I should be completely out of my depth as to capital, for, instead of sending me 10 waggons a day, he would have sent me 40 or 50, never thinking that I should object to it. After that I weighed his suggestion in my mind, and I said to him, "Where "is the money to come from?" I should mention that Staffordshire is a place where, at the end of each quarter-day, you must draw bills upon the parties at three months or at four months; they will tell you when to draw. When a railway company, or, say, the Midland Company, want to be paid, the coal owners will tell them when to draw. I said to him, "If you send me a large number of waggons "every day, in less than a week I shall be unable to "pay beyond my capital." Then he said, "We will "get your bills discounted for you." I said, "Who "will discount them? Let me have a good under-"standing with them, and then I will look at the "matter." He said, "I shall not let you know that "until you make yourself liable." I said, "I shall "not do so till I know who they are, and for no "other reason than this, that the persons who dis-"count my bills and you will divide my profits. I "shall have none by paying discounts and your "dividing the profits. I shall have nothing left, "besides taking all the risk, and I will not be put in "such a position."

1889. (*Mr. Glyn.*) How long is it since this occurred?—It was in August 1854, I said to him, "If "anything takes place, I must take all the risk, and "somebody else must take all the profit;" then he said, "We will stop your trade if you do not do it." I can well remember how I felt under that, for I thought that I was quite independent of such a position as that. I saw that I was to be put in a very dangerous position, at the risk of a sudden stoppage of my trade, or that I must become liable for more risk than I could cover. I studied for ten minutes about it, and then I said, "I will do this in order to meet you. If "you have got any money I will go and buy coke "for you, and sell it for you. My servant is George "Bright, you know him, and you will know who "buys it, and the people at the collieries where I get "the coke from shall keep the account for you. I "will give you the profit, and charge you nothing for "doing it." He said, "Pooh, pooh, nothing of the "sort. I will not do that." I said, "The other will "not do for me." Then he said, "We will stop your "trade," and in less than three weeks they did stop it; they unloaded three waggons when they came to York and took the coke out, and so my trade remained stopped until the beginning of 1863, and then they allowed me to carry it on again under sufferance.

1890. When did Mr. Sherriff cease to be connected with that line?—A few months afterwards; I think 12 months afterwards. I knew Mr. Robson, who had lent himself to the West Hartlepool people in lending money, and I had a long consultation with him about it; he was possessed of money, and he got into it by advancing large sums of money for the purposes of trade. There is no doubt that the ball was at my foot then, if I had chosen to take up that position, but I should have been representing a very great sum without having the capital, and also taking the risk.

1891. (*Chairman.*) Did not you complain of this traffic manager's threat to stop your trade?—Yes, but no relief was given.

1892. (*Mr. Glyn.*) Mr. Sherriff left, you say, in a few months?—Yes; he then went to the Oxford, Worcester, and Wolverhampton Railway as general manager there. The same thing was done with Gooch and Pryor, E. and A. Prior; the locomotive superintendent of that railway got them to lend themselves to everything when a proposition was made; these young men lent themselves to it. I saw them at Peterborough, and they had then 75,000*l.*, I believe, in the bank, and they were then large buyers of coal, and were carrying on an immense trade. After this had been going on, I think for 18 months, one of them said, "I am going to leave the company, "and shall withdraw from your trade;" he brought no capital in, and they gave him 15,000*l.* when he went out. He then went on to the Great Western Railway, and invested his money in collieries there, but it ruined them; they became bankrupts, and that was the cause, there is no doubt, of the stoppage of my trade, although I struggled against it.

Then look at the Court of Exchequer, when an action was brought, I did not know much about law then, and I was at the mercy of the gentlemen whom I employed. An action was tried at York with regard to that coke, and the verdict was in my favour; it was then brought to London, and the verdict was set aside on the ground that the tender upon the branch railway that runs to the colliery was not a proper tender, and I had all those costs to pay. They said that there was no tender; that the tender must be made with a horse and cart at the station where the company hold

themselves out to carry, and that you must take the goods to the station where they hold themselves out to carry. Now I do that; I take them in sacks, coals in sacks in a cart, but that is no use to me; you may see that it is impossible to carry on the coal trade by putting coals filled in sacks into a horse and cart, and then taking them to the station, but to bring them within the law you could do that. The question was tried before Mr. Baron Martin, and it was ruled in my favour, but instead of their having all the damages to pay, I agreed to assess the damages at 1*s.*; and then we come to the Court of Common Pleas, and they set the verdict aside, on the ground that it was not a holding out to the public to carry; that taking them to the station as I did was not the usual way in which coals were taken, and that you must tender in the usual way. Then I took the case into the Court of Error, and there we had the Judges of the Court of Exchequer, and the Judges of the Court of Queen's Bench, and they were of opinion that the tender had better be made, and a new trial had; but with a view to starting my trade I ought to make another application to the Court of Common Pleas. I made another application to the Court of Common Pleas, and they said "your remedy is by an action at law." So that I was thrown about from court to court in this way. I must beg again to refer to Johnson's case, and to say that that case is not like mine. The case of Johnson *versus* the Midland Railway Company was this; a railway was made up the Okeham Canal from Melton Mowbray; the Midland Railway Company bought the canal from Melton Mowbray to Okeham, and for years before that railway was made, Mr. Johnson had been in the habit of sending his coals up that canal to Okeham, but the moment the canal communication was taken away from him, he had no means of getting his coals to Okeham except by the railway. The access to his coal was by the canal from Melton Mowbray, he brought his coals to Melton Mowbray by the canal, and he wanted his coals taken to Okeham from Melton Mowbray, and he did not know how to do it. At that time the Midland Railway Company never provided any waggons for the carriage of coal, nor held themselves out to carry coals from Melton Mowbray; they did not carry coals from Melton Mowbray for anyone, but these coals were brought by canal to Melton Mowbray, and Mr. Johnson wanted to put them on to the railway; he took his coals to the station in a cart, and he said, "Here are "my coals, I want you to take them to Oke-"ham," upon which they said, "No, we do not "provide waggons for the carriage of coals; we "have no such accommodation; we do not do it for "any one." The court ruled in that case that the company were not common carriers, as they did not carry for any one else from Melton Mowbray. My coals are brought and the only difference is, that the colliery owner pays the charges with my money, and I pay him cash at the end of the month, but he pays them by an acceptance; that is how the usual trade is done.

1893. You still carry on business in coal, do you not?—No; my business is stopped entirely; all my money is locked up in one place; there are three of my contracts now as to which I have only given a guarantee. I cannot get the coals carried; they will not take them, and they stop my trade entirely.

1894. (*Chairman.*) It is not that they charge you high rates, but that they will not take the coals upon any terms?—Yes, they stated that the reason why they stopped my trade before was, because I refused to pay the charges; they will not let the coals be carried in my name; they will carry the coals in the name of a colliery owner, but they will not give me now the same facilities that they give to others; they tell me that they have not room for me. They will give the coal owner every facility, and he will do everything they wish; they let him have the same facilities as they let other people have, and I say, "Let me have the same means for my coal," but they say, "No."

1895. Has this coal owner other contracts with other dealers?—Yes, lots of them.

1896. (*Capt. Galton.*) Are there no dealers on the North-eastern line?—No.

1897. (*Mr. Glyn.*) Do they carry other coals for other dealers?—Yes, there is a coal owner in the county of Durham and in Yorkshire; and I should have every facility from these coal owners if I could get the North-eastern Company to let my coals come on.

1898. (*Capt. Galton.*) Is it not the case that the North-eastern Company allow a certain number of coal owners to send their coals to every station on their line, but that their station master acts as the agent for those coal owners and sells their coals to the public?—Yes.

1899. There are no dealers allowed at any of the stations?—There are one or two stations where there is an exception, and there are stations where all the facilities are let to one man; he is the great merchant for that station. There are a few stations where all the facilities are let for so much a year, and any man wanting to supply coals must supply them to that man.

1900. As a general rule the railway company allows a certain number of coal owners to send their coals to the several stations to be sold by the agent at that station?—Yes, as the coal owners require; but the public can only get such coals as those collieries supply. The coal owner may be on one side of the railway and they will take 4*s.* 4*d.* a ton; then another coal owner on the other side of the railway will have no facilities given to him, so that he cannot get to the same towns at all that the other one can; they say, "We have not room for you."

1901. (*Mr. Gower.*) What remedy have you to propose for these evils?—If the Railway and Canal Traffic Act had these words "undue and unreasonable" struck out, and they altered the word "may" into the word "shall," so that I might say to the Judges, "Here is a case where the traffic is stopped. "The Act does not say you 'may' order it to be "forwarded it, but it says you 'shall' order it to be "forwarded," that would give me a remedy, and they could not stop my trade. Then I should have sufficient grounds to bring an action against the company, and to settle it on the other side of the question; but so long as the word used is "may" the court would say, "There is no remedy."

1902. (*Chairman.*) How is it the interest of the company to interfere with your trade?—The only way in which I can see it is this: There is a colliery owner, say, who supplies the line with large quantities of coal, and I think I can say to whom the company allows credit, and who owes a large sum of money for carriage, and if they were to let everybody in, that man's trade would fall off; he would no longer have the monopoly; and some one else would come in, and the money which he owed for charges would be at a risk. There are cases in which some coal owners pay every month, while some give their acceptance. I know that large credits are given in the leading charges. I know from Mr. Forster, one of the colliery owners, that he pays by an acceptance.

1903. (*Mr. Glyn.*) You say that they do not only exclude dealers, but also some of the colliery owners?—Yes; there are colliery owners, and there is one in Yorkshire, who said that he should have been here, but I find that he has not been. They exclude coal owners, and if any one sells coals at a lower price than another, they stop him. Suppose, for example, you live at Richmond in Yorkshire, or within 30 miles of the coal pits in Durham, if you want your coals from a particular colliery, you must pay 1*s.* a ton more for them than anybody else, and 1*s.* a ton in a large trade amounts to a large sum. I consider that 6*d.* is more than I want for profit; if I get 6*d.* a ton I am satisfied; but their system of management defies you to realize a profit, from the variety of charges there are to pay every month. After I commenced

Mr. W. Oxlade.

10 th May 1865.

this last time, the account showed that the charges are hardly ever made the same month after month; that they vary as much as a shilling, as in the case I mentioned in Yorkshire.

1904. (*Capt. Galton.*) Is it not the case that this system is adopted by the North-eastern Company, because they say that their stations do not afford sufficient accommodation to enable them to allow any one to come in who chooses?—I do not know that they swear that. I think that they might say that, but I will not say that they swear it. If they made an affidavit it would not be true, because they have plenty of room, and if they had sworn it I should have them upon the affidavits, but they cannot swear to that, for they swear that their system is to deal with the colliery owners exclusively, and they also pick and choose the colliery owners.

1905. (*Chairman.*) Is it within your knowledge that any coal owners have complained of being excluded?—There is not one but who would be glad to see the system broken up, for, as Mr. Robson said to me, "I have invested my money in coal and coke works, "and if the railway company chose to stop my "trade, they would ruin me in less time than they "would you. I cannot get away, and I am in a "false position, for, as the law stands, there is "no dependence upon this coal branch of mine; "they might say, 'We will not carry for you at "all.'" The coal owner is, therefore, afraid of the company, and every coal owner in Durham would like to see the trade thrown open, so that they could sell to any person they thought proper; but they are afraid of the North-eastern Company, knowing that they would bring their weight to bear upon them at once. I know that in my own case, if Mr. Forster was called, he could say that if he sold the coals to Mr. Sparkes, they would be charged less for than if they were sold to me.

1906. (*Mr. Glyn.*) Can you assign any reason for this?—Only this reason, perhaps, that there is a good understanding existing between certain parties. I do not know that there is, but I know that Mr. Sparkes was a friend of the present accountant, and they were considered as partners at one time, before the Leeds Northern was amalgamated and they used to have a trade amongst them. I know of nothing else.

1907. (*Chairman.*) Do you know that of your own knowledge?—I know that it was the case at one time. I do not say that it exists now; but there was such a thing before the Leeds Northern was amalgamated with the North-eastern Company. Mr. Sparkes sent nearly all the coals on to the Leeds Northern line.

1908. You said that Mr. Sparkes was a friend of the accountant's, or was acquainted with him?—That was a general remark. I could not prove that; but I know that Mr. Sparkes can have every facility afforded to him that I cannot.

1909. (*Capt. Galton.*) Who is Mr. Sparkes?—He is now representing himself as the owner of the West Belmont colliery; and when I first began trade Mr. Sparkes had a sort of private agreement with them, that if he sent 10,000 tons, they were to be carried at a halfpenny; but he never could send 10,000 tons when my trade was going on; but as soon as my trade was stopped, he sent the stipulated quantity, and he got a large drawback from that time. Mr. Sparkes was in a very different position then; he is now a coal owner, and he was then an agent for the colliery. The Great Northern Railway Company were dealers in coal at one time. I was then taking all the produce of the West Belmont colliery, and the Great Northern Railway Company made an arrangement with myself and Mr. Thomas Bell, the coal fitter, at West Hartlepool, for all the coal, and in large quantities it came to London.

1910. (*Mr. Glyn.*) Did you send your coals over the Great Northern line?—Yes.

1911. From that colliery?—Yes.

1912. First on to the North-eastern line to York, and then on to the Great Northern line?—Yes. I was taking at that time from the West Belmont colliery the whole of the produce, and they put it to me in this way: If you can take more than we can draw up this shaft, we will put down another shaft. Mr. Bell was kind enough to say that, and to let us have the same rating. I was too off-handed at that time, and I said, "No, we have confidence in "you, and I will take all the coals." But the moment I got that trade opened, Mr. Bell, who was a coal fitter, a son to the gentleman of the same name, stepped in, and made an arrangement with some of the Great Northern people for all the best coal. Now, observe, I had bought it previously to that, and they charged him 2*s.* 7*d.*, but when I got the dues account for all the coals that I took, the charge was 5*s.* 2*d.*, and nothing less.

1913. You were carrying coals from the same point that Mr. Bell was?—Yes.

1914. They charged him 2*s.* 7*d.*?—Yes.

1915. And they charged you 5*s.* 2*d.*?—Yes, and he had of course got the coal owners over in this way; he would say, "I can give you 9*s.* a ton at the "pit; Oxlade can only give you 8*s.*" As soon as I saw that I said, "I should be very sorry to stand in "the coal owners' way; I can go to another pit; "let it go." I said, "If you can get another shilling "a ton more get it." I saw how it was to be done, and that was the first time that I saw it. My coals went on to the North-eastern line then, and the coke over the Midland line, and on to the South Staffordshire.

1916. (*Chairman.*) You have now described the general nature of your complaints?—Yes.

1917. You complain that, in certain instances, the North-eastern Company charge much higher than their authorized tolls?—Yes.

1918. You have addressed a letter to the Royal Commission containing a number of alleged instances, in which you say that the North-eastern Company charges higher than its authorized tolls; you assert that those charges were actually made?—Yes; that has been done since Mr. Thompson became chairman, and previously to that.

1919. Have you anything to state in addition to what is contained in your letters, or do they contain all the facts that you wish to lay before the Commission?—Those letters contain all the facts (*see Appendix* G.), and if there is any point that you desire to have explained, I will explain it. I charge them with making charges upon the public higher than their proper toll; for example, they charge for agricultural produce 10*d.* a mile, the highest toll is 3*d.*

1920. (*Capt. Galton.*) Is not the toll that you have just mentioned the toll which they charge when they do not provide the locomotive and carriages?—That includes everything; it includes engines and waggons, and no further charge is to be made, except a reasonable amount for loading and unloading.

1921. Between what places do they charge these high tolls?—At every station on their line.

1922. (*Chairman.*) I suppose they justify the charge on the ground that they are terminals?—No, what they say is, "That is our charge, if you do not "pay it, take the goods away." I allude to the North-eastern Railway Company's agent; and if any individual took goods to the station, that would be the charge. If it was furniture that he took, it would be 1*s.* 2*d.*, but their highest toll under their Act is 3*d.*

1923. (*Capt. Galton.*) Do not people complain of that charge?—Yes, they do; but then the railway people immediately point to "Oxlade," and they say, "Look at what we have done with him; if you begin "to complain, we will serve you the same," and that is how they frighten people. They deal with them in that way; it is quite sufficient to tell them that they will serve them in the same as they did "Oxlade." They do not want any more. Suppose any person raised a question about these overcharges,

the railway company would say that they were not common carriers, and you would be in the same position as I am. You could not help yourselves. If they are not common carriers for one thing, they are not common carriers for anything. They could say, "We will not carry furniture for you, just the same "as in the case of coal." They charged me 10*s.* 10*d.* for a ton of coals taken to the station in a cart, for a distance of 62 miles, which ought to have been 5*s.* 2*d.*, but they gave up that sum and paid it into court.

Mr. W. Oxlade.

10th May 1865.

1924. (*Chairman.*) Have you anything further to state?—No, but I can attend again if necessary.

The witness withdrew.

Adjourned to Friday next at 12 o'clock.

Friday, 12th May 1865.

PRESENT:

His Grace the Duke of Devonshire.
The Right Hon. the Earl of Donoughmore.
The Right Hon. Lord Stanley, M.P., F.R.S.
J. A. Roebuck, Esq., M.P.
T. B. Horsfall, Esq., M.P.
Robert Dalglish, Esq., M.P.
Geo. Carr Glyn, Esq., M.P.
A. S. Ayrton, Esq., M.P.
Capt. Douglas Galton, R.E., F.R.S.
E. T. Hamilton, Esq.
J. R. M'Clean, Esq., Pres. Inst., C.E.
W. Pole, Esq., F.R.S., *Secretary.*

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S., in the Chair.

Mr. William Kirby Sullivan called in and examined.

Mr. W. K. Sullivan.

12th May 1865.

1925. (*Chairman.*) You are professor of chemistry to the Museum of Irish Industry at Dublin?—Yes.

1926. Has your attention been much directed to the subject of Irish railways?—Yes, especially in connexion with the transport of mineral products.

1927. Do you wish to confine your evidence solely to Irish railways with reference to mineral products?—I should like also to offer some evidence with reference to agriculture.

1928. Are you prepared to give evidence generally upon the subject of Irish railways?—I am.

1929. Do you consider that the fares and rates of carriage for goods and parcels charged in Ireland are injurious?—I do.

1930. Do you consider that the produce of the mines and quarries and agriculture generally would be greatly benefited by a cheap scale of fares and rates?—Certainly.

1931. Are you of opinion generally that cheap rates and fares would stimulate trade?—Yes.

1932. Will you state your opinion as to the effect which you think will be produced by the diminution of fares?—I believe that the first effect would be a considerable development of mining; I also think that agriculture would be very considerably benefited, especially in the portions of the country which are most backward because most distant from the markets; I believe as there is now a tendency to engage in manufacturing industry in Ireland, more than perhaps has existed for 20 or 30 years, that it will greatly stimulate that tendency.

1933. Are there any facts upon which you ground your opinion, that a diminution of fares would be accompanied by a large increase of traffic?—I will first direct the attention of the Commission to two cases in connexion with mining, which will show what is the influence of the present rates of transport upon that branch of industry; I may observe that although we have a great number of mines in Ireland, they are not very rich and they are scattered through the country, many of them only giving produce of a low value, as, for example, sulphur ore, iron ores, and zinc ores. The present rates which are charged upon these products are exemplified in the case of the Wicklow Copper Mining Company. The Vale of Avoca is the centre of the largest sulphur mining operations perhaps in Europe. Formerly copper was extensively obtained there, but latterly, say for about the last 20 years, the sulphur ore has been the chief product, and from 80,000 to 120,000 or 130,000 tons annually have been exported. Iron ore is also found there in great abundance, and is now extensively worked. The distance from the Vale of Avoca, where the mines are situated, to the stations at Kingstown is 39½ English miles, and the charge for the sulphur ore to that point is 4*s.* 3*d.* per ton, making consequently a rate of something more than 25 per cent. of the total value of the product, which is 16*s.* per ton free on board.

1934. (*Earl of Donoughmore.*) That includes terminal charges?—Yes; the railway charge upon the iron ore is 3*s.* 9*d.* per ton.

1935. (*Chairman.*) Where is that from?—From the same locality to Kingstown. I take Kingstown, in the case of the sulphur ore, rather than the Harcourt Road Station, because practically very little except the local consumption of Dublin itself would be delivered there; 3*s.* 9*d.* per ton upon iron ore is very nearly 50 per cent. of the total value, because they have to pay, besides the 3*s.* 9*d.* for the carriage of it to Kingstown, a charge of 3*d.* per ton for taking it from the depôt at the mine to the station itself; so that virtually the charge is 4*s.* or exactly 50 per cent. upon the total value. Independently of the more valuable ore, there is an article called "smalls," which are the broken pieces, the value of which is only 6*s.* per ton, delivered free on board. They cannot send that at all, because the charge would be the same for that as upon the ordinary sulphur ore. It would be 4*s.* 3*d.* per ton to Kingstown, leaving, therefore, only 1*s.* 9*d.* as the margin for cost of production and profit. So that the present charge would be 72 per cent. of its actual value. The produce of this one mine for the year ending the 1st of March, 1865, was, of common pyrites, 30,600 tons; and of iron ore, 15,164 tons. The total produce being 56,576 tons.

1936. Then you include some other item?—I have included all the other varieties of ores which have a higher value, and therefore do not come under the categories which I have mentioned. I have included the copper ore, and a portion of the deposit of copper; which make a total of 56,576 tons. That produce could, were it not for the charges paid, have been raised to a very great extent. The company had, I am informed, contracts for this year which would have enabled them to sell 80,000 tons altogether of ores from that single mine, but they could not fulfil them, owing to the difficulties with the railway company. The "smalls" are of course not sent at all. There is one other port to which ores are sent, which is only 6¼ miles distant, namely, the Port of Arklow, which is only available in the summer months in consequence of the bar.

1937. (*Earl of Donoughmore.*) In point of fact it is not a port at all. It is only an open roadstead?—It is an open roadstead. The charge to that place is 2*s.* 6*d.* per ton for the 6¼ miles, or about 4·8 pence per mile. On the 9th of May, in consequence of those charges, and the difficulties with the railway, the mining company had 120 carts carrying ore to Arklow, having thrown the railway company overboard

Mr. W. K. Sullivan.

12th May 1865.

altogether, finding it cheaper to deliver it in that way at Arklow, than to take it to Kingstown.

1938. (*Mr. M'Clean.*) Is there a tramway to Arklow?—The tramway was made originally by Mr. Hodgkin, but it has been sold to the railway company.

1939. (*Mr. Horsfall.*) Which railway company is it?—The Dublin, Wexford, and Wicklow Railway Company. I may add that that is not the only loss which the Vale of Avoca as a mining centre suffers, because we lose the advantage of return freights from the coal trade. The coal vessels coming into Dublin are obliged to return chiefly in ballast; of course they do not go to Arklow, and so the mining company loses the advantage of that return freight which the delivery in Dublin or Kingstown would give them; and now that we are to have a line of screw colliers, the advantages of return freights would be more certain.

1940. (*Chairman.*) Do you know whether the Wicklow Copper Mining Company have ever made a representation to the railway company upon the subject of their charges?—Yes.

1941. (*Mr. Glyn.*) Have they refused to make any reduction?—They have refused the offer made to them by the mining company.

1942. (*Mr. M'Clean.*) Do not the mining company pay a very high dividend?—They do.

1943. And the railway company a very high one?—Yes; that railway is perhaps the one which pays the best dividend in Ireland. As I have no direct interest in either the railway or the mining company, I have mentioned the case only as an illustration of the influence of the cost of transport upon our mining. I can also mention other cases.

1944. (*Chairman.*) There are mining companies in the Vale of Avoca besides that, are there not?—There are several. There is another district, the traffic of which comes upon a different line. It would be one of the largest mining districts after Avoca itself; it is in the centre of Ireland, in the county of Tipperary, where the influence of the cost of carriage is still more important upon the produce, namely, the district of the zinc mines near Nenagh. The ore is peculiar there, a portion of it is very rich, quite as rich as that of the zinc mines in Germany or Belgium, but a large portion is also mingled with ochre, which has to be removed by an expensive process of washing, and the consequence of that is, that a large portion of it cannot be transported at all. In one month the net return of the mine was 307 tons, valued at 692*l.* 8*s.*, and the cost of the carriage was 217*l.* upon that. The total quantity of zinc ore exported in 1864 was 3,500 tons, and of fire clay 100 tons, so that the total sent by rail was 3,600 tons; and there was brought from Waterford 500 tons of coal. The total tonnage of ore, coal, and fire clay was, therefore, 4,100 tons. This is exclusive of stores and of other ores.

1945. Where was the carriage to?—That is a good illustration of our railway system. The nearest port would be Limerick which is not many miles distant, but they are obliged to carry to Waterford. It costs about the same to Waterford, to Cork, or to Dublin. Limerick is nearer, but they cannot take it there, and the cause of that is that there are no railway wharves, therefore the cost of taking it to Limerick would be greater in consequence of having to cross the city than it would be to send it on to Waterford.

1946. Do the railways come nearer the wharves at Waterford than Limerick?—They come alongside, which makes it more economical for them to send it to Waterford than to Limerick, although the distance is nearly three times as great.

1947. The charge is something like 15*s.* a ton, is it not?—No, the charge compared with the usual charges is moderate enough, because they have more facilities for carrying it up to Waterford. They carry it at 6*s.* per ton; the charge of 15*s.* includes the freight to Swansea.

1948. What is the railway charge?—It would be 6*s.* per ton.

1949. How many miles?—It is about 80 miles from Limerick to Waterford.

1950. (*Earl Donoughmore.*) What is the station?—The station is Bird Hill. The chief difficulty is that the Bird Hill station belongs to the Waterford and Limerick Company; and the mines are several miles distant from it; so that there is a large expense in carting the ore to the Bird Hill station. They are only about a mile and a half from a branch of the Great Southern and Western, which runs from Nenagh to Bird Hill. Looking to the access to that district by the other line the Great Southern and Western very naturally did not like to go to the expense of a station at Shallee, for which they would have to pay all the expense, and only be benefited by the receipts of two or three miles; so that the existence of the two companies on the one line of communication threw a great obstacle in the way, and raised the traffic charges very considerably.

1951. (*Chairman.*) Are there any other mines that you wish to call the attention of the Commission to?—I should say that the limit of production in those mines will not be reached for very many years. I have been down in the mines myself, and I know what the extent of their production is; and I must say that if there were facilities of transit given at a cheap rate, say at half of the present rate, I am sure the quantity of ore which would be sent would be certainly three times what it is at present.

1952. Do you think it could be put on board ship for 3*s.* a ton?—I think it could, and that would leave a considerable profit.

1953. Is the production from the mines capable of being rapidly increased?—Very rapidly indeed. All the investigations, as far as sinking is concerned, are made, and the levels are driven through the mass of the ore, so that at any time the amount that could be raised may be easily calculated.

1954. Would it not be for the interests of the mining companies themselves to promote a branch line from their mines to one of these larger railway companies?—That is exactly the very point at issue now.

1955. Have the mining companies themselves ever promoted a tramway to one of those lines?—If they could get a station upon the Great Southern and Western they would I have no doubt make a tramway, because they would be able to bring the waggons upon the railway loaded, but the obstacle in the way of that being done is that there are two competing lines just at that point, so that the line which has the station and which would have to give them the right of running their carriages over it is precisely that which would have the least benefit from it.

1956. (*Capt. Galton.*) What is the value of this ore at the market at which it is sold?—The poorer ore which exists in the largest quantity could not realise more than about 30*s.* per ton.

1957. Sold where?—Sold in Swansea.

1958. What does it cost to raise that ore in the mine itself?—The cost is very considerable. I could scarcely enter into it now. All that I can say with regard to that at present is that it would not pay to send the ore.

1959. But they do raise it now?—No, they only send the richer. Considerable quantities of inferior qualities are obtained in the dressing of what is raised, but the poorer ores are not at present raised where it can be avoided.

1960. Are the mines deep?—Some of them are deep. They go down to ——

1961. Do they run into the side of the mountain at all?—Not this particular mine. The better ores would fetch from 42*s.* to 46*s.* per ton.

1962. (*Chairman.*) How much do they send in the year?—They cannot send the poorer ores at all, because there would be no margin for profit. Suppose the freights had been reduced to one half what they are at present there would have been a margin of 1148*l.* upon the zinc traffic arising from the operations of last year.

1963. (*Capt. Galton.*) What is the freight from Waterford to Swansea ?—About 2*s.* 6*d.* per ton.

1964. And the charge by railway is 6*s.* per ton ?—Yes.

1965. Therefore it would cost 21*s.* 6*d.* to raise the ore on the spot ?—You have always to add the cost of transport to Bird Hill station.

1966. What distance is that ?—About six miles.

1967. What would they convey that at ?—It would be at least 6*d.* a ton per mile. I believe it actually costs 3*s.* 6*d.* per ton.

1968. That would be about 19*s.* per ton ?—Yes.

1969. And it would cost that to raise the material ?—It would cost that. They would have to dress it.

1970. What is the process ?—They have to crush it, and then they have to subject it to a very elaborate series of washings so as to remove the whole of the ochre.

1971. Has it to be subjected to any heating process ?—No. An attempt is about to be made to convert it into oxide of zinc so as to diminish as much as possible the weight of stuff which is to be sent to the smelting works in Swansea.

1972. If they could get coal at moderate prices would it be worth while then to reduce it on the spot ?—Not perhaps to reduce it but to make oxide of it.

1973. At what price ought the coal to be in order to enable them to do that ?—I have not made the calculation and it will be a very difficult matter. I should not like to venture just this moment to say what it would be. In fact the experiment is in process of being tried and it might be premature to say what would be the effect, but I know that the charge upon the coal is itself an obstacle to making the attempt.

1974. (*Mr. Roebuck.*) Is there any use made of the ochre ?—As yet none, most of it is run into the river.

1975. (*Mr. Horsfall.*) I think you stated that it would pay the companies to carry this ore for 3*s.* per ton for 80 miles ?—It would. If it had been carried at 3*s.* per ton instead of 6*s.* it would have given a margin of profit on the operations of 1864 of 1148*l.*

1976. (*Chairman.*) A profit to whom ?—To the mining company on their zinc ore.

1977. (*Mr. Horsfall.*) Have you entered into any calculation as to what would be the profit to the railway company at these rates ?—I have not, because I consider that the increased produce that would be raised from the mine would give them a slightly higher interest than they have at present.

1978. Do you know what the expense of working the line is, how much per mile ?—The working expenditure on the Waterford and Limerick line was 301·39*l.* per mile for 1863.

1979. What is that per ton ?—That includes their whole working expenditure. I have not the means of determining the cost of the goods traffic per train mile.

1980. What proportion of that 3*s.* per ton would fall on the company who work the line ?—Considering that they have a sufficient rolling stock to do the work at present, and that they would bring back a considerable portion of coal, I do not think the increased expense would be very much. I do not think the increased quantity would be any additional expense at all.

1981. (*Mr. Glyn.*) They would carry in fact full loads ?—Yes.

1982. What increased produce must the mining company give to allow that reduction of the railway rate ?—If it reduced it to half, the mine should give double the produce, for instance, the 307 tons ought to be 614 tons.

1983. You have no doubt at all of the capability of the mine to produce a very much larger quantity ?—I have a perfect certainty of its being capable of producing a three times larger quantity with the greatest facility.

1984. Therefore in point of fact the directors of the mining company could make a contract with the railway company for the delivery of a certain quantity, provided they reduced their rate ?—I am quite certain they could do that, subject of course to the variation of the market in England.

1985. (*Capt. Galton.*) How far are they now from the River Shannon ?—They are, at present, not more than 9 or 10 miles from the River Shannon, but between them and the Shannon is a range of mountains, or rather high ground, lying between Nenagh and Killaloe.

1986. Is it not less expensive to them to get down to the Shannon, and go to Limerick that way ?—Much more expensive, in consequence of the carriage across to the river, and then of course there would be the transhipment on board, and a second transhipment again on the Shannon itself. If there was a railway wharf at Limerick it would be very easy to send it down to Limerick, which would reduce the rate to one-third. It would be quite possible to send to Limerick if there was a railway wharf there at the rate of 2*s.* per ton, which would be one-third of the present rate.

1987. (*Chairman.*) Is there any extension of wharves at Limerick in contemplation at present ?—I do not think that in the present condition of Irish railways, unless some change is made by amalgamating them all, any extension of that kind is contemplated, except perhaps in Dublin. With regard to Dublin, the change will be made, because a Bill has passed which will connect all the docks, which are now more or less useless, with the railways ; there is a circular railway for that object. That is the only case of a railway wharf being proposed that I am aware of in Ireland, and I am not aware that it is contemplated to do so in either of the ports of Waterford, Cork, or Limerick.

1988. If the railways to the south of Ireland were amalgamated, do you think it would be for their interests to make a branch into these mines of which you have been speaking ?—I certainly think it would.

1989. What saving would there be in that distance between the mines and the Bird Hill station ?—The saving would be fully 2*s.* per ton, allowing a large margin for filling and other expenses.

1990. Would the freight from Limerick to Cork be the same as from Limerick to Waterford ?—About the same, because you can get a chance of return freights. It would be to the interests of the company to own the vessels themselves, and in fact to bring back coal in return.

1991. Do you know whether the Great Southern and Western have ever considered the practicability of carrying the ore on their own line to Cork, with the view of shipping it there ?—It would be too great a circuit, because they would have to go back to the junction upon the main line, and then carry it for nearly double the distance on their Cork line. In order to get to their Cork line through Limerick they would have to pass over two lines ; they would have to pass over the Waterford and Limerick and the Foynes Railways.

1992. (*Capt. Galton.*) Are those two lines worked by independent companies ?—Yes. The Great Southern and Western Company have running powers over the Foynes line from Patrick's Well to Limerick.

1993. (*Earl Donoughmore.*) I suppose if the Great Southern and Western Company had a station at Shallee to accommodate this Calamine Mine, that they could charge the maximum rate under the six miles clause for going to Bird Hill ?—They could.

1994. Have the Great Southern and Western Company ever made any proposal to the promoters of those mines to take their ores for them to Dublin ?—I do not think they have, because the mining company never contemplated going to Dublin in consequence of the absence of a railway wharf, but perhaps that would be remedied by means of the new line connecting the railway termini in Dublin. The cost of transport to the Great Southern and Western Company of their own coal, in consequence of the absence of wharves, amounts at present to about 1*s.* 9*d.* per ton. That is the actual cost of the carriage from the

Mr. W. K. Sullivan.

12th May 1865.

ship's side in Dublin to the Great Southern and Western depôt. The cost of the transport of ore would of course be equal to that. Then there is the loss sustained by carting it across Dublin, which, from the ore being so to speak in a state of mud, would be very considerable; the loss on the ore as it is, amounts to nearly three per cent.

1995. (*Mr. Horsfall.*) You spoke of the export of sulphur as being between from 120,000 to 130,000 tons. To which port is that exported?—To Liverpool and Glasgow.

1996. (*Mr. Glyn.*) I understood you to say that if a communication was made between the termini of Dublin by the Great Southern and Western, it is probable that it would all come by that route?—I am quite sure that it would be more economical than by the present system; but evidently as branch lines do not intervene, if there was only one company to deal with, and the same facilities were offered in Cork as in other markets, it would be cheapest to send it by Cork. If you have a separate large coal trade with South Wales it would give a back freight.

1997. I suppose the general freight is a little more for the Welsh ports?—The Great Southern and Western coal costs 3*d.* per ton less at present delivered in Cork than in Dublin.

1998. (*Chairman.*) The charges for the minerals that you have alluded to on the Irish lines are larger than the charges usually are in this country for mineral ores?—They are, because the mines are situated in a very different way from the English ones. Ours are scattered about, and the produce has all to be brought to a central point, whereas in England the greater portion of the ores of low value lie round the districts where they are smelted, and consequently are carried on a very large scale.

1999. Is the rate per mile higher in Ireland than in England?—Yes, because in Ireland the carriage of these ores has never really been developed in consequence of the scattered position of the mines, and it being impossible to make a rate for them. They are included in the general merchandise and goods at ordinary rates.

2000. Have there to your knowledge ever been any negotiations between the railway companies and the mining companies to get up a traffic of that kind?—There is that particular case of the Vale of Avoca. The Wicklow line was made through the Vale of Avoca under an impression that one of the chief sources of revenue would be mineral traffic; that, in fact, it would be a mineral line.

2001. (*Capt. Galton.*) Who finds the waggons?—The railway companies in all cases in Ireland.

2002. (*Earl Donoughmore.*) Do you know anything of the port of Wicklow?—Something.

2003. That is not so bad as Arklow?—It is not so bad as Arklow. Ores were formerly carried to Wicklow when the carts were used.

2004. Are you aware that before the railway was constructed there was a great deal of the sulphur carried by the shipping?—Yes.

2005. Are there no facilities for the shipping of ores at the port of Wicklow now?—I believe they are shipping from Wicklow, as far as the return freights will enable them. The great advantage which was expected to arise from the line to Kingstown was the existence of a large fleet of return vessels, which would have carried it back in place of ballast. Now there is a very active competition in sulphur ore, a very superior quality being brought from Spain, and even from Iceland; so that it is a trade in which there is a very active competition indeed.

2006. (*Capt. Galton.*) Are those ores superior to the Wicklow ores?—Yes; because of course they will only carry that portion which is superior from a great distance.

2007. (*Earl Donoughmore.*) Is it not the fact that Sicily is a country from which an important part of the sulphur is derived?—Yes; but since the differences arose, about 1840, between the King of Naples and our Government the importation from Sicily has very much diminished. A very large portion of the sulphuric acid of Great Britain is now made from pyrites, and it is owing to that that we are enabled to carry on a large chemical trade even in Dublin itself.

2008. Are there chemical works in Dublin?—Some of the largest works for the manufacture of bleaching powder in the United Kingdom are in Dublin.

2009. Do they use this material which you speak of?—Exclusively; it is in fact owing to the advantage of having it that such a trade has been enabled to grow up there. First, one large works was built, and then another; and I believe a third will be built soon. Besides that, there are two manufactories for oil of vitriol using chiefly pyrites, and only a very small portion of sulphur.

2010. (*Mr. Glyn.*) This is in the face of these high rates?—It is.

2011. (*Chairman.*) Are these mines which you have spoken of in the principal mining districts in Ireland, or are there other mineral districts of importance?—There is one other large district, which is near Carrick-on-Shannon, containing iron ores and a coal field. The iron ores there are extremely rich, but the coal is not very good; and though abundant enough for a local trade it could scarcely ever become the basis of large smelting operations; some furnaces were erected there, but they are not now worked. I have no doubt that if facilities existed for transmitting the ore to Dublin, even at the present prices, that it would pay to take it from Lough Allen to Carrick-on-Shannon.

2012. There is a railway communication now from Carrick-on-Shannon to Dublin?—There is; but the charges at present would preclude the possibility of sending the ore that way.

2013. Do the railway companies think it would not be to their interest to charge such rates as would enable them to carry this iron ore to Dublin?—If the traffic were to come into existence the railway companies, I daresay, would reflect about it, but it is the absence of the traffic which prevents them thinking about it.

2014. Are the mines at Lough Allen worked to any extent?—Not at all; an attempt was made latterly to send some portion of the ore to England, but I do not think it was very successful.

2015. Do you know what description of ore that was?—Clay-ironstone of very superior quality.

2016. (*Mr. Glyn.*) Do you not think that the communication about to be made between the several railways of Dublin and the quays will obviate a great many of these objections?—It will; but obstacles will still exist from the number of different companies.

2017. The cost of carting from the termini to the quay in Dublin must in point of fact be prohibitory?—Quite so.

2018. Therefore many of the railway companies could scarcely have thought of the traffic as a remunerative traffic?—It would in any case be a speculative traffic, even though a person who is perfectly acquainted with the resources of any mineral district may know how far they could be developed. I am quite certain that it would ultimately pay, yet you cannot expect that twenty Boards of Directors, or even five or six, would all agree that that speculative hope would be fulfilled. Consequently, they will not make any improvements, especially in the presence of their shareholders, who, with a diminution of their passenger traffic, and a diminution of goods traffic, are afraid to make the slightest change of any kind.

2019. (*Mr. Hamilton.*) Has there been a decline of the traffic?—Yes, a steady decline both in passengers and goods traffic upon all the Irish lines.

2020. According to a parliamentary return which I have before me there was an increase comparing 1862 with 1863. Has the decrease taken place in 1864?—If you take the whole series of years you will find that the total receipts per mile will show a de-

crease. It will not do to take the total receipts of the number of miles open ; the mileage receipts must be taken ; thus, in 1859 the receipts were 1024*l.* per mile per annum ; in 1860, 1003*l.* ; in 1861, 1017*l.* ; in 1862, 904*l.* ; and in 1863, 872*l.*

2021. (*Capt. Galton.*) That is the receipts per mile ?—Yes.

2022. The mileage has increased ; but the traffic has not increased in proportion to the mileage.—Exactly.

2023. Had any comparatively unimportant lines been opened in the interval on which the traffic was small ?—A few branches but not any very important lines.

2024. (*Lord Stanley.*) Your theory is that the lines not paying better than they do is due to the rates of fares adopted being too high ?—Certainly. If you draw a line from the north of Ireland, say from Londonderry to Cork, you will divide the country into two portions. The greater part of the population west of that line is extremely poor, and cannot afford to travel ; owing to the peculiar organisation of the agricultural classes there, the small farmers have scarcely any ready money, and the labourers have no wages, and therefore both have no money to travel with. A considerable change is now taking place in the country, wages are more frequently paid in money, and are gradually increasing, and although the population is diminishing, and there is a decline of traffic upon the whole of the railway system, I have not the slightest doubt that if the fares were reduced there would be a proportionate increase of the traffic.

2025. How is it that railway companies who are in all other countries supposed to be the best judges of their own interests have never seen the matter in that light ? — Some do see it in that light and some do not. It happens that there is a greater conflict of opinion in Ireland as to what measures would benefit the country than any other country in Europe, and that conflict of opinion has been very injurious to the country. One set of persons will tell you that there is only one remedy, and another set will argue that there is no remedy at all ; that the resources of the country are limited and are rather decreasing ; and if you were to halve the fares you would only halve the receipts and that you would not get more traffic.

2026. (*Mr. Glyn.*) All the directors appear to be of that class ?—I should think not.

2027. None of them have reduced their rates ?—I have just heard that the Wicklow Company have reduced their rates to the original fares that were paid on the Dublin and Kingstown line.

2028. For passengers ?—Yes.

2029. How long has that reduction been made ?—Only since the present movement with regard to railways began.

2030. (*Chairman.*) Then that experiment has not been tried sufficiently long to know what the final effect of it would be ?—No ; but Mr. Dargan's intention is, I understand, to propose a very considerable reduction of fares and rates. The present condition of things in Ireland, I am sorry to say, is such as nearly to paralyse any bold speculative effort of that kind ; when you have to deal with so many different interests, however speculative a man may be, he cannot carry it out. A man like Mr. Dargan would of course see the probability of success clearly.

2031. Do you think that that difficulty would be diminished if the total number of companies to be dealt with were smaller ?—Or better, if the original plan when railways were first contemplated in Ireland were carried out, of having one central administration.

2032. One company for the whole of Ireland ?—Yes ; or some arrangement by which the traffic rates and the existing fares might be regulated by one company. I have no doubt that with a limited board they would see that their interest is clearly to develope the traffic within the area which feeds each line.

2033. (*Lord Stanley.*) Whether you have one company or many, would not the same difficulty arise that exists now, that whatever ultimate gain there might be there would be a considerable temporary loss, and the shareholders who might possibly not intend to retain a permanent interest in the concern would not be prepared to incur that loss for the sake of the ultimate benefit ?—I daresay that there would be a certain loss in the first instance ; but there would be some gain from the amalgamation by lowering the cost of administration, and perhaps the traffic expenses also would be diminished somewhat, which might in part compensate for that loss. I have no doubt there would be for some time a loss, but there would ultimately be a proportionate gain.

2034. (*Chairman.*) Have you reason to believe that there is room for any considerable reduction in the cost of management and in the conduct of the traffic ?—Perhaps not much ; the traffic as a rule is economically conducted on the Irish lines. The total working expenses might perhaps, by consolidation of all the railways, be reduced to 39 or 40 per cent.

2035. Is not the cost of management a very small per-centage ?—It is not a very large item. The proportion of working expenses to total income in 1860 was 45 per cent. ; in 1861, 44 ; in 1862, 48 ; and in 1863, 49.

2036. (*Mr. Hamilton.*) Will you give what it is per train mile ?—The expenditure per mile in 1860 was 456*l.* 8*s.* ; in 1861, 451*l.* 2*s.* ; in 1862, 436*l.* 6*s.* ; and in 1863, 431*l.*

2037. Is that per train mile ?—Per mile of line opened. I have not calculated the amount per train mile for all the Irish lines, but on the Great Southern and Western it was about 2*s.* 4·2*d.* in 1864. This would not be far from the general average for the entire of the Irish lines.

2038. (*Chairman.*) Are there any companies working as low as 39 per cent. in England ?—Not in England.

2039. Or elsewhere ?—Yes. Some of the lines in Belgium and Prussia. The working expenses on the Cologne and Minden line I think are as low as that. The expenditure of the Cologne and Minden line was in 1861 39·75 ; this return includes not only the amount of the working and traffic expenditure but also the cost of management, rates, taxes, and everything included, in the same way as they are in the usual returns of the English and Irish lines. The Cologne and Minden line is not a small line, but a line of 301 English miles.

2040. You have spoken chiefly with reference to the possible development of mineral traffic ; do you consider that there is also a possibility of a great increase in the passenger traffic and in the carrying of agricultural produce in Ireland ?—I have no doubt whatever as to that. The one great obstacle which I have always seen to the increase of passenger traffic in Ireland, as far as the third-class passengers are concerned and a portion of the second, arises from the small incomes of the persons who form those classes. A portion of the people do not go at all upon the railways in Ireland. They cannot afford to pay the fares, and they will walk 30 or 40 miles rather than go upon the railways, because the fares would be greater than they could possibly afford. In one half of Ireland the agricultural labourers receive no money-wages but are paid in kind ; that is to say, they get a piece of conacre land or receive the grass of a sheep and matters of that kind as wages ; they scarcely ever have any money. The only money that they do see is what they receive for eggs, butter, and things of that kind that are taken by the carts going along the road. The development of a system of cheap parcel traffic rates upon the Irish lines would be one of the greatest benefits to the whole district to which I have alluded by giving these people small sums of money.

2041. Do you think that the passenger fares could be reduced sufficiently to enable these very poor people to travel upon the railway ?—I am quite sure it would now compensate them to pay half the present fares in order that they themselves may sell their eggs and other produce at a large market town. There is a system of huckstering going on along the road. They sell their goods to hucksters instead of

Mr. W.K. Sullivan.
12th May 1865.

sending them by the rail. I was greatly struck with an instance of that in the north-west corner of Ireland, during this past year, where I saw immense quantities of cabbages in all the small plots of land in the county of Mayo and North Galway absolutely rotting, when in Dublin we can hardly get it. The working classes there are really very badly off for them. It is a curious fact, that Dublin now supplies a great deal of vegetables to Belfast, Glasgow, and Liverpool, indeed a large portion of the cabbages produced there are shipped away. I asked one of those people why he did not send his cabbages to Dublin. He was a peasant who was in the habit of visiting England during the harvest, and he told me that the thought had struck him already, and he had made a trial, that is to say, he had made inquiries at the railway station, and he found that the cost of transmitting half a ton or a ton of his cabbages, having to send them there without knowing much of Dublin arrangements, would be more than the total value.

2042. (*Mr. Glyn.*) What would the charge per ton be to Dublin?—The charge from the point I am speaking of would be, at the lowest rate charged for any merchandize, 11*s.* per ton; I do not think, however, that cabbages would be carried at the lowest rate.

2043. By the railway company?—Yes.

2044. You think that if they were taken at half that charge it would pay the company?—Yes, certainly.

2045. What is the distance?—The distance is about 130 miles to the place I am speaking of. I know a gentleman in the county of Wexford, who is in the habit of sending crops of that kind to Dublin at the rate of 8*s.* 9*d.* per ton.

2046. (*Capt. Galton.*) Would it be possible for the railway company to carry goods of that sort, for which they would be liable in case any damage should occur to them, at such a low rate as 6*s.* per ton for 100 miles?—I have no doubt that it would be, considering that their waggons are half empty. The average load of a goods train in Ireland is not more than 42 tons.

2047. (*Mr. Glyn.*) It would all serve to make up a train load?—It would.

2048. (*Capt. Galton.*) With reference to your remark that the passenger traffic had decreased in Ireland, you did not mean that the total number had decreased, because I find from the return that the numbers of those who travelled in 1863 as compared with 1862 were 1,140,000 as compared with 1,000,000, but that the mileage had increased from 1,400 to 1,600 miles. Therefore, while the passengers had increased one-tenth the mileage had increased one-seventh?—I did not. I have no doubt that the number of passengers will continue to increase.

2049. Do you think that there will be a large traffic in people who wish to carry their produce to market towns so as to enable them to sell it in those towns instead of to the hucksters as you have described?—I have no doubt of it.

2050. What sort of fare would enable that to be done?—I should say that it ought to be done at a halfpenny per mile for the third class. One penny is the present rate for the third class, for no reduction is made upon return tickets. The third-class passengers are excepted in Ireland from the advantages of a return ticket, so that the man who makes a journey of 20 miles to a particular place and returns, pays 40*d.*, whereas the second-class man only pays 45*d.* for the same distance, which is only one-eighth of a penny per mile more.

2051. (*Mr. Glyn.*) You would say it should be a half-fare for a certain distance?—Yes, I should say if it were reduced to $\frac{1}{2}d.$ per mile that that would be within the income of a very large number of persons.

2052. (*Chairman.*) Has the experiment ever been tried on any line in Ireland of the effect of low fares?—The only case which would afford an answer to your question that I can recollect is that of the Foynes line. I do not know whether it is quite to the point. The circumstances of the Foynes line were these, that they increased the fares both on the Foynes line, and on the steamer which was connected with it. The increase was put on in the year 1863; in the year 1862 the total numbers carried were 87,256.

2053. Will you state what the fares were then?—The fares were raised to Rathkeale, which is an important market town, from 2*s.* 6*d.* first-class, 1*s.* 10*d.* second-class, and 1*s.* 1*d.* third-class, to 2*s.* 10*d.* first-class, 2*s.* 2*d.* second-class, and 1*s.* 5*d.* third-class. The total numbers carried to Rathkeale in 1862 were 87,256; in the year afterwards, when the increased fares came into operation, they fell to 71,383; and in 1864, to 63,046. A little steamer connected with the line and carrying passengers from Foynes to Kilrush which was called the Kelpie, during the four and a half months of the summer of 1858 was plying at opposition fares of 1*s.*, from Limerick to Kilrush, and she carried 14,047 passengers, producing 1,358*l.*, which would give for the half year 18,729 passengers, or 1,810*l.*

2054. What season of the year was that?—The summer season; the traffic of that line is chiefly a pleasure traffic. Kilkee, to which the passengers repair from Kilrush, is a considerable bathing station.

2055. (*Earl Donoughmore.*) A sort of Ramsgate?—Exactly. The numbers for the half year ending 31st December 1859, which is the next season after the opposition fares had been in operation the fares were raised to 3*s.*, 2*s.*, and 1*s.*, were 14,997 passengers, producing 1,702*l.*; and in the two last seasons, the fares being 4*s.*, 3*s.*, and 2*s.*, the numbers were for the half year ending 31st December 1863, 8,304 passengers, producing 959*l.*, and for the half year ending 31st December 1864, 10,362 passengers, producing 1,138*l.*, so that it would thus appear that a reduction of more than one-half produced exactly the same amount as did the very highest fares that they charged.

2056. (*Mr. Horsfall.*) Have they no low fares upon market days in Ireland?—I only know of three places where there are such trains. In the neighbourhood of Belfast they run one on the Banbridge line; on the Waterford and Limerick there are three each week from Carrick-on-Suir to Waterford; on the Cork and Passage there is a Saturday market train.

2057. What is really the reduction?—On the Cork and Passage line I think a return ticket is issued at a single fare. I do not know what the reduction is in the other cases. Special trains are sometimes run on fair days on many Irish lines, but the usual are I believe always charged.

2058. (*Mr. Glyn.*) If the third-class fare were reduced would it not give an opportunity to the people to go to market and sell their produce themselves instead of selling it to hucksters on the road?—I think so; and that such a reduction, coupled with a reduction of parcels rates, would greatly assist the development of trade in Ireland. At present persons who send butter from the counties of Wexford and Wicklow to Dublin, are charged as much for three cools of butter (a cool is a sort of tub in which they send it) as for one; and the same rule applies to return empty cools. A large trade has sprung up between Cork and Dublin in butter, and those who send it are small farmers. It is a very peculiar trade, and being unsalted butter it will not keep very long. The day before I left a person who is a farmer, and who first established the trade, came to Dublin to see whether he could do anything with regard to the rates at which it was carried, and he found it impossible to get any reduction from the company.

2059. (*Chairman.*) Is the butter trade restricted in consequence of the high fares on the railway?—It has a great effect upon the price in Dublin.

2060. (*Capt. Galton.*) What is the price of butter in Dublin?—The price at course varies, but that butter sometimes comes up to 1*s.* 6*d.* per pound. It is a trade which has grown up gradually, and is now very considerable.

2061. It is a great export trade, is it not?—This is a particular kind of Cork butter, in fact, there are two kinds of Cork butter. The export trade in Cork, salted butter is about 1,000,000 firkins per year; but there is a fresh kind of butter in which there is a considerable trade; it is of a better kind than the other.

2062. What does the other good butter sell at in Dublin; is that dearer or not than the other butter?—We do not get any of the other butter at all from Cork.

2063. I am referring to that which is sent to the market of Dublin?—That is dearer.

2064. What is the price?—The price varies from 1*s.* 2*d.* to 1*s.* 6*d.*

2065. Of the 1*s.* 6*d.* per pound for the best Cork butter what is due to the carriage; what does it cost to convey a certain number of pounds from Cork to Dublin?—That particular kind of butter must be sent in small parcels because it does not keep, especially in summer, therefore it must be sent every day. The parcels rate upon the line are very high. There are between 30 and 40 dealers in Dublin, each of whom receives his parcels separately.

2066. Would a parcel weigh between 30 and 40 pounds?—Some would weigh only 20 pounds, some 15 pounds, and some as little as 12 pounds. The distance from Cork is 165¼ miles, and the rate upon a parcel of 14 pounds is 1*s.* 3*d.* up to 100 miles.

2067. Then it will not be above 1*d.* per pound upon a parcel of 15 pounds weight?—It would only be 1*d.*, but there are other charges.

2068. Do they deliver it for that?—Yes, they deliver it to certain places for that; not to all.

2069. What reduction could be made which would make any appreciable difference in the price of the butter?—They could reduce it to one-third of a penny.

2070. But that would only save two-thirds of a penny upon a pound out of 1*s.* 6*d.*?—Although the people who use that butter can afford to pay for it, nevertheless, this small reduction is of some importance. I am referring to this particular traffic, however, more as an illustration of the effect of high parcel rates upon the smaller agriculturists.

2071. Do you think much more would be sold at 1*s.* 5½*d.* per pound instead of 1*s.* 6*d.*?—I think so.

2072. (*Mr. Glyn.*) In fact it does not come in large quantities?—It comes in small quantities, which in the aggregate, make a great deal; it is a gradually growing trade.

2073. Have the dealers ever tried to make a contract with the company for the conveyance of it based upon quantity?—It would be no use making a special contract for sending a large quantity, because that kind of trade branches out, and you cannot tell what the quantity you may want at one period, and what it may be at the next period.

2074. (*Mr. Horsfall.*) Have you heard any complaints in Ireland as to the unequal rate of charges between town and town?—Yes; as an instance I may mention the case of the mining company of Ireland. We have only one smelting works in the whole country, namely, the smelting works for lead and silver near Dublin. Considerable quantities of sheet and pipe lead, shot and red lead are made there. The margin for profit must be very narrow, considering that we have to import the coal, and have to pay for labour, labour being dearer in Ireland than it is in England, although, and indeed because, the wages are so much lower. The rate from Dublin to Newry by rail is 15*s.* per ton for lead, and the rate to Belfast is 12*s.* by rail. It is cheaper to send it the whole of the way to Belfast than to the intermediate station of Newry.

2075. What is the mileage to Newry?—It is very nearly 70 miles to Newry, and 113 miles to Belfast.

2076. (*Mr. Glyn.*) Is that inequality caused by the competition of the railways?—There are three lines in that distance. It is carried 113 miles for 12*s.*, and by steamer for 10*s.* 1*d.*, and it is carried to Newry which is not quite 70 miles, by rail, for 15*s.*

2077. (*Earl Donoughmore.*) Are there steamers between Dublin and Newry?—None.

2078. There are between Dublin and Belfast?—Yes.

2079. (*Mr. Glyn.*) Then the competition of the sea rules that?—Precisely. The result is, that the whole of the district which derives its supplies of lead and other articles from Newry by the inland lines branching from it, is shut out entirely from our only smelting works. That difference has been quite enough to drive the Dublin manufacturers out of the market, so close is the trade in these three articles.

2080. (*Mr. Horsfall.*) Do you think that the rate of 12*s.* to Belfast pays the company?—I think it ought to do so. That question depends much upon the total amount of their trade. If the amount of the trade was as much as it ought to be between those important places I have no doubt it would pay them very well.

2081. Can you give any idea what the extent of that trade is?—It must be very considerable. I can give the ordinary returns. It is composed of three lines. We have first the Dublin and Drogheda, then the Dublin and Belfast Junction which commences at Drogheda and goes down to Portadown, and then there is the Ulster line which goes on from Portadown to Belfast. The Dublin and Drogheda Company's total income per mile was 1,125*l.* for 1863, which is the only year for which I have the return at hand. The income of the Dublin and Belfast Junction was 1,128*l.*, so that the trade is practically the same upon more than two-thirds of the whole distance. The income of the Ulster line was 1,035*l.* per mile.

2082. (*Earl Donoughmore.*) Those figures do not give an accurate estimate of the trade between Dublin and Belfast, because both the Drogheda Company and the Ulster Company have other lines which do not form part of the main lines?—No, they do not; but there is a compensation in this way, that upon each separate division of the line there are other lines entering which feed the main line. For instance, the Drogheda line is fed by the line to Navan passing through a portion of the rich grazing grounds of Meath. There is also a direct line from this district into Dublin. Then the Dundalk line gets a good deal of the inland portion of the Ulster trade over it, and the upper part of the line gets a portion of the Armagh and Tyrone trade, so that each of them has a feeder of its own. The return for each division of the line is nearly practically the same per mile, and a great deal of that trade actually comes down to Dublin.

2083. (*Mr. Horsfall.*) Are you aware of any complaints of unequal rates upon any line where there is not a sea competition?—Yes; on the line between Cork and Limerick; for instance, from Bruree to Limerick butter costs 9*d.* per firkin, and to Cork, which is about double the distance, only 5*d.* I have an instance upon the same line with regard to the carriage of turf and coal. One truck with 5 tons of coal costs 17*s.* 1*d.* from Cork to Bruree, and a single ton 6*s.* 3*d.*, and it costs nearly as much from Limerick. For turf brought from the Rathmore station on the Killarney line to Bruree, about the same distance as from Cork, they charge 1*l.* 7*s.* 6*d.* for a box, which would be about 3 tons weight of turf; and as 3 tons of turf is not more than the equivalent for heating purposes of 24 cwt. of coal, it is a perfect prohibition of that important source of industry.

2084. (*Mr. Horsfall.*) Do you think if there was an increased traffic in coal that it would at all supercede the trade in turf?—The coal trade of Ireland is one source that I would look to for an increase in the traffic. In 1825 the coal trade was about 750,000 tons, and in 1835 it was over one million tons. It is now fully double that, yet, it has only effected an entrance as it were upon the margin of Ireland. I have no doubt it will be four or five millions of tons before many years.

2085. (*Earl Donoughmore.*) Do you think that that will have the effect of very materially increasing the consumption of turf?—I do not think so. I think

Mr. W. K. Sullivan.

12th May 1865.

the consumption of turf will increase, but its price will gradually rise. Unless there are some other means of cutting it than those in use at present, it will be only able to supply the places around the bogs. In the south of Ireland turbary is gradually decreasing in quantity. Wherever the upper part of the deep bogs has been cut away, it is reclaimed and used as grass land, which is more valuable than to cut it down to the marl, especially where it is of a large extent. Where coal is dear, then, of course, turf pays for cutting. A ton of turf averages from 90 cubic feet to 250, that is as stacked for sale; it will be easily understood, therefore, that it is not likely in its raw state to be sent in any large quantities. Coal which can be brought in a concentrated form at a cheap rate as compared with turf, will supercede it, except upon the immediate margins of the bogs.

2086. (*Capt. Galton.*) What is the size of a ton of turf as compared with a ton of coals?—It would vary from three to six times.

2087. That is, one ton of turf would occupy the space of six tons of coal?—Yes, that is the extreme.

2088. A railway waggon would not carry more than one ton of turf?—Not more perhaps of the light, which practically would never be carried. Turf cut from the upper portions of a deep bog and air dried in the usual way, would have a specific gravity of 0·4 or 0·6, and towards the bottom of the same bog it would be from 0·8 to 0·9. Some of bottom turf may even have a greater specific gravity than water.

2089. (*Lord Stanley.*) Have all the attempts which have been made at various times to compress it so as to make it easily portable been perfectly unsuccessful? — They have been perfectly unsuccessful in producing an article capable of competing with coal for general purposes, because the cost of pressure is so enormous.

2090. (*Chairman.*) Can you name any other description of traffic which you think would be developed in Ireland by low fares?—I would say generally that there might be a large traffic in most articles of agricultural produce. More cattle, for example, would be sent upon the railways than now. On the Bandon line no cattle are now carried; they are all walked from Bandon to Cork.

2091. (*Capt. Galton.*) Have they ever been carried on that line?—They have to some small extent.

2092. Is the fare higher now than it was then?—Much higher.

2093. (*Mr. Glyn.*) What distance is that?—Twenty miles. In the neighbourhood of Dublin, which is of course the great centre of the cattle traffic, being close to the English market, nearly all the cattle are walked to market. The Honourable Mr. Massey, who grazes a large number of cattle, says that he buys a great many cattle in Tipperary and distant fairs, and he finds that he can always drive them by road for half what it would cost him to send them by rail. At the last fair of Ballinasloe he found that it was better to send the cattle by boat to Dublin, although there is a railway station on the line to Dublin a quarter of a mile from the town. A person who is most largely connected with the cattle trade of Dublin has given me the following information, which I am also able to substantiate myself. That "In October 1863 the Midland and "Great Western Railway Company raised their "cattle rates at all the intermediate stations between "Ballinasloe and Dublin. The following May the "number of cattle and sheep conveyed, as compared "with May 1863, fell off considerably, and in October "1864 the great proportion of the store cattle were "walked home. Within the last two years the cattle "traffic of the Grand Canal has risen from a mere "nothing to from ten to twelve boat loads of live "stock weekly." That bears out what Mr. Massey stated with regard to the last Ballinasloe fair. One of the chief objections urged by owners of cattle against the management of the cattle traffic of the Great Southern and Western, which, upon the whole, being a very long line of railway, is well conducted, is, that the drover who has to go with a whole waggon is charged half a fare with the carriage of the cattle, and will have to pay third-class fare upon his return. In addition to that, they make a distinction at certain stations between half a waggon and a whole waggon. A whole waggon is supposed to hold eight beasts, and they allow three for half a waggon; but if the drover puts four into it they charge him the price of a whole waggon. I would like to mention here another instance of the effect of high fares connected with the herring fishery in the neighbourhood of Dublin, which has grown to be a most important trade. The poor persons engaged in the local trade walk from Dublin to Howth, a distance of nine miles, because the cost of a third-class ticket would be often as much as their profit for a day. The consequence is, that any traffic which would be derived from that source is lost.

2094. (*Capt. Galton.*) What is the rate of a third-class ticket?—The usual fares per mile on the Irish railways are, first-class, 2*d.*, second-class 1½*d.*, and the third-class 1*d.* for a single ticket. A third-class ticket to Howth costs 8*d.*

2095. (*Mr. Glyn.*) A half fare would help them very much indeed?—I have asked several of them, and they have told me that a return ticket, at a half fare, would enable them to travel by it.

2096. (*Mr. Hamilton.*) Are you aware that in the neighbourhood of the metropolis the fares are much less than half the fares by the trains carrying the working classes being something less than one farthing per mile?—I believe so.

2097. (*Mr. Horsfall.*) With reference to a question that was put to you, as to the new lines which have been made in Ireland, there are some as we know which have been nonpaying lines; do you consider, putting those out of view, that for the traffic upon the substantial lines the receipts have decreased?—I think not. Although I have stated that there has been a gradual diminution according to the mileage returns, I am rather hopeful about the future.

2098. (*Mr. Glyn.*) Has not that reduction arisen chiefly from the opening of branches which have not yet developed their resources?—No doubt that is the chief cause; but of course there has been a considerable depression owing to two or three bad years; in fact, the country is in a transition state.

2099. You stated that there was a considerable cattle traffic as between Navan and Dublin?—Yes; Dublin is the chief port for cattle. A great deal goes by Drogheda direct. There is a line of steamers from Drogheda direct.

2100. Are they carrying cattle at lower rates upon that line than upon the rest of the Irish railways?—I cannot answer that question, for the simple reason that I did not apply to that line for their traffic rates, because they do not print traffic rates, and you have to copy them off boards kept in the office. The traffic rates are very liable to vary.

2101. I understood you to say that the cattle traffic had developed itself?—No, they walk all to Dublin now.

2102. You stated some time back that in making the aggregate receipts for one of the northern Irish railways the cattle trade to Belfast formed a very considerable item?—Or, rather, the cattle trade to four ports upon the whole line from Belfast to Dublin, namely, the cattle trade to Belfast, the cattle trade to Newry, the cattle trade to Dundalk, and the cattle trade to Dublin.

2103. Have the rates for cattle upon the railways connected with those towns been at all diminished?—No; in the case of one of the lines feeding Dublin they have actually raised the rates.

2104. In spite of those rates they continue to send them that way?—Yes; but from places 20 or 30 miles off, where the cattle are sent to be finished, they walk them to Dublin, which is a very great disadvantage to the cattle.

2105. Even for long distances?—Even for long distances, and fat cattle especially.

2106. (*Chairman.*) It must require a very low fare, must it not, to enable the store cattle to be carried on the railways? — Certainly, considering the fluctuations in the price of store cattle, the margin left for profit when they are fattened is very small, and to be profitable they ought to be carried at a very low rate.

2107. Has any scheme ever occurred to your mind by which the experiment of low fares can be fairly tried in Ireland?—Beyond that of an amalgamation of lines, I would rather not make any statement as to what would be the best mode of doing it; but I should say that one first step should be to amalgamate the lines, because I do not think that anything can be done unless the whole of the lines are placed under one central management.

2108. Do you see any prospect of that being the opinion of the directors generally, and that they would be willing to concur in an Act amalgamating all the railway companies in Ireland? — I could not say what would be the individual opinion of the directors, but I know that there is a general feeling in Ireland that such a plan would be very advantageous. I do not think the boards of directors would throw any difficulty in the way; that is, always taking into account that the arrangement left them at least in as good a position, financially, as at present, or that it was advantageous to the shareholders.

2109. Supposing the lines to be amalgamated, have you any reason to suppose that they would be willing to try the effect of low fares?—That is a question which I would rather not venture to suggest. If I were a director myself I certainly would venture upon it.

2110. (*Mr. Horsfall.*) Would the amalgamation do any good unless they did agree on a reduction of fares?—It would do good in this way, if in no other; it would enable rates to be made which would suit particular localities; it would make the rates uniform, and enable branches to be made at a trifling expense, because all the railways would concur to have what I think is most important, namely, wharfs established at the different ports. It would also diminish the actual expenditure. These would be the substantial benefits of amalgamation. Supposing the fares were not reduced, there would be still substantial benefits, which could not fail to be effective of much good in the country. I venture to think that it is only when the lines would be amalgamated that the boards of directors would begin to see what they find in other countries, that it is their business to develope the resources of a locality. They have the monopoly of the carriage, and every town or district in which they create a traffic, will ultimately improve their condition.

2111. Would it not be the fact that if the expenditure were diminished, and the rates not lowered, that it would benefit the railway companies?—I should certainly be in favour of lowering the rates, but I only answered a portion of the question, that there would be substantial benefits, even to the country, from an amalgamation by a uniformity of rates, and by the removal of the anomalies which now exist, by the facilities of coal wharves and other matters, even supposing there was no substantial diminution of rates. I was going to add that it appears to me that the same principle ought to be applied to railway traffic which is actually applied to the valuation of land in Ireland through the country, and that is, the further you are from the market the lower the valuation must necessarily be.

2112. (*Captain Galton.*) How do you apply the principle of the value of the land to railways?—I mean the valuation for fiscal purposes, which after all regulates the actual market value of land to a great extent, is in this way—first, you have the actual intrinsic value of the land.

2113. But how would you apply that to railways; do you mean that as far as the railway is from the market so would you diminish the rates?—I would do it exactly in the same way as is practised in Belgium with so much success, and which, with the permission of the Commission, I will add to my answer. The principle has also been tried in France upon two or three of the French lines. In the report recently published by the Railway Commission appointed by the French Government to take into account the whole circumstances of the French railways in 1863, it is stated that this reduction was made by the companies of their own will. It is a differential rate of the kind which I suggest. They have applied it chiefly to ores and other metals. The French commissioners hope that this principle will be adopted generally.

2114. That is a uniform rate of charge?—No; a differential rate according to distance (*a paper was here handed in, which is printed as Appendix* A. E.).

2115. (*Chairman.*) Are you prepared to recommend any change in the Irish railway system generally, such as the amalgamation of all the lines into one great company?—I should say that that is rather a question for the Legislature. I am quite satisfied that in Ireland there is a disposition to have one regular system adopted for the whole country with uniform rates, in the regulation of which the resources of the country would be studied. That was also the opinion put forward in all the reports made on the subject of the establishment of railways in Ireland. In the debate upon Irish railways, after the second report was presented, the late Earl of Carlisle, then Lord Morpeth, proposed to make one great line, and to raise a large sum of money by guarantees obtained for it, and the fact is mentioned by him in his speech that several meetings were held in the towns in favour of the system which we now find would be beneficial; and in the Report of the Railway Commissioners nearly all the advantages which I have imperfectly pointed out are referred to.

2116. (*Mr. Glyn.*) Did they not rather propose to divide the country into districts and not into one central management?—Yes; that was one of the propositions, but that would come more or less to the same thing.

2117. Do you think the whole of Ireland could be managed by one central board?—I think it could.

2118. Do you not think, looking to the separate interests which are at stake, that it could be more easily managed by dividing it into three great districts? —Unless those three different boards could have some intimate relations with each other, and the means of settling their disputes, I am afraid they would be a very great disadvantage.

2119. Suppose there is that legislative power of some sort given?—It is a matter which I can scarcely venture at the present moment to give any fixed opinion upon.

2120. What reduction would you propose in the present rate upon the coal traffic as necessarily to bring about its development in Ireland; take a given rate and say what the reduction ought to be?—Taking 30 or 40 miles the cost of a ton of coal would be from 3*s.* 6*d.* to 4*s.* for that distance. To this you have to add about 1*s.* 9*d.* which is what it costs the Great Southern and Western to carry their coal to the railway depôts. If they were to have a wharf, and reduce the 1*s.* 9*d.* to 6*d.*, and the railway carriage to half the present rate, it would make a very substantial difference to the manufacturer. It would make a serious difference to him to be able to save 3*s.* per ton in the cost of his fuel. I think it should be at least a reduction of one half of the present charge, in order to make a very substantial inducement to anyone who would be disposed to attempt manufactures.

2121. (*Chairman.*) Have you ever thought that the growth of flax might be stimulated by low rates for carriage?—Undoubtedly, especially in the whole of the Midland districts. One of the great disadvantages under which the attempt to cultivate flax has laboured has been the getting up of scutch mills; scutch mills cost a considerable sum of money, and unless they are fed throughout the year and very carefully worked they do not produce a very large profit; a great number of persons are indisposed to erect those in consequence of the high rates of the railways. They may

Mr. W. K. Sullivan.

12th May 1865.

grow flax, but the mills may be completely idle, and the consequence is that in the remote districts of Ireland if they do grow flax it is left on the hands of the small farmer and he cannot sell it; if he attempts to send it unscutched of course the bulk is considerable and the rate which he would have to pay would swallow up the entire of his profit if he has to send it for any considerable distance inland. If the rates were very low, that is, if they had that differential tariff which I have spoken of for certain articles, there can be no doubt it would be very advantageous and have the effect of concentrating scutching mills. There would be greater facilities for sending the flax by rail to one central station, and there would be a larger profit realized by it.

2122. (*Mr. Glyn.*) Would not the flax be injured in its transit?—Not when it is steeped and dried; I assume that that should be done by the farmer. When once the straw is dried it can be sent by the rail. Of course the green flax could not be sent.

2123. (*Mr. Gower.*) Have you ever considered what effect the amalgamation of all the railways into one company would have on the future extension of the railway system of Ireland?—It would be beneficial if there were any railways to be made; it would obviate the enormous expenses which are now attendant upon obtaining Bills, because it would remove the opposition to them which now exists, and it would take away the chance of making lines competing against each other and carrying them through districts which do not require them.

2124. Then no new lines would be made competing with the existing lines?—Certainly not, under those circumstances.

2125. Do you think there would be as many lines made in consequence?—I think on the whole there would. I do not think it is always an advantage to the whole country to have lines made through districts competing with others. I do not think it is an advantage to carry two lines through the same district. It may be to the persons immediately concerned for the moment, but ultimately it must be injurious if neither of the lines pay.

2126. Would it not be a great advantage to the districts through which such lines might be taken?—If you have two lines competing for a certain time they will ultimately amalgamate, or one purchase up the rights of the other. We have a very good instance of that in the case of the Grand Canal and the Great Southern and Western Railway. The Grand Canal, which has a separate board of directors, is unconnected in fact with the Great Southern and Western; but its rates of carriage per ton are exactly those of the railway, even for substances like brick and coal. They have had a fight for a long time, and then they have came together and made arrangements by which they created a monopoly. It is a curious fact that it costs just as much to carry a ton of iron ore by railway, or a ton of anything, from Carrick-on-Shannon as it did in 1835 by that canal. I got the rates at which they carried goods upon the Grand Canal, and I find that practically they are, in several instances, the same rates.

2127. (*Capt. Galton.*) The rates are the same upon the Grand Canal now as they were in 1835?—For most of the distances there is very little difference. They are lower in parts, but taken as a whole they come to substantially the same thing.

2128. (*Chairman.*) Are there any other points which you wish to direct the attention of the Committee to in connexion with Irish railways?—I intended especially to have drawn attention to the undue proportion which the cost of carriage of the agricultural produce of our poorer lands bears to its value. Considering that Irish agriculture has now to compete with the entire world, and that we are transferring part of our population from the poor lands of Ireland to the richer ones of Illinois and other portions of America, that, in fact, in the case of a large number of poor farms, the rates of carriage to the markets amount to nearly the rent in some cases, any substantial reduction of fares on the lines, especially with differential rates such as I have alluded to, would be one of the greatest advantages which could possibly be bestowed upon Irish agriculture.

2129. (*Earl Donoughmore.*) Are you aware that it costs less money to transport a fat bullock from Normandy to London than it does from the pastures of Limerick to London?—Precisely. A friend of mine was actually disposed to go to Holland and buy store cattle and take them to Galway to fatten, and he expected a very considerable profit upon them.

2130. I presume you have heard of Mr. Pollock, the great agriculturist?—Yes.

2131. Are you aware that he has very large farms in the neighbourhood of Ballinasloe?—Yes.

2132. Did you ever hear that he was in negotiation with the Midland Railway Company about special rates for the carriage of his cattle to Dublin?—I heard that he and others were negotiating for that purpose.

2133. Did you hear that Mr. Pollock, not being satisfied with the terms which the railway company were inclined to give him, actually went to the expense of hiring land at different distances along the road to Dublin, so that he might be able to drive his cattle?—Yes, that is one of the points which I intended to draw attention to. Mr. Pollock would not send the cattle at all, but drove them along the road, stopping at night on the different plots of land that he had hired. He preferred walking the cattle to paying the rates which were demanded by the railway company. Some of the directors of the Midland line do actually walk their own store cattle alongside the line.

Mr. R. Mallet.

MR. ROBERT MALLET called in and examined.

2134. (*Chairman.*) Are you a member of the Institution of Civil Engineers, London?—Yes.

2135. And a fellow of several of the scientific societies?—Yes.

2136. And I believe you are President of the Institution of Civil Engineers of Ireland at the present time?—I am.

2137. Have you been long resident in Ireland?—I have. I have not been resident in Ireland for the last six or seven years; but previous to that I resided the greater part of my life there. I may mention that between 1836 and 1856 the engineering firm to which I belong, consisting of my father and myself, (either I as a civil engineer, or our house, as mechanical engineers,) were concerned with almost every public or other large work being carried on in Ireland during that period; and I therefore became familiar with almost every part of the country from one end to the other.

2138. Do you include railways amongst those works?—We executed large quantities of works for the Irish railways.

2139. You are well acquainted with the industrial elements of Ireland generally?—I think I am. We employed several hundred hands for many years in Ireland.

2140. Of course you are of opinion that railways are of great importance to any country: but are you inclined to think that there are reasons which make railways of more importance to Ireland than to almost any other part of the British dominions?—I think there are. It is obvious to those who know anything of Ireland, that its trade is almost wholly confined either to domestic wants, or to export and import trade with other portions of the British Empire. Its outgoing trade is altogether from the east side, the west side which faces the Atlantic is almost a blank. For the produce which goes east it is all important that

it should have a ready means of transport across the land, in fact, the main of the export trade goes across the land in greater or less degree before it reaches the seaports, from whence it is exported. That is one reason. But there is another reason, that refers to its domestic trade. To contrast England with Ireland for a moment, taking for example the Black Country, the coal owners send their coal from perhaps half a mile to a mile to blast furnaces where the pig iron is made; and the sale of the pig iron takes place within a quarter of a mile of the man who puddles it and rolls it into bars. And then again the bars or plates are sold in Birmingham and the neighbourhood. The whole manufacture and trade goes on within a narrow circle up to the point of reaching the consumer. The products of Ireland being mainly agricultural, (although there ought to be a large amount of mineral products which are as yet imperfectly developed,) would have to traverse a much larger space before they would reach the consumer, or any market in which they could be made available. Besides that, they are products very bulky and of small relative value, upon which, therefore, transport bears more heavily than upon a vast proportion of the manufactured products of England and Scotland.

2141. Will you state your views as to the importance of coal being carried upon Irish railways upon low terms?—It may seem at first sight that in a country provided with such a superabundance of peat as Ireland, and with labour presumably at a low figure, coal would be a matter of comparative indifference, inasmuch as peat would be a substitute for it. I have found, however, from experiments conducted in past years on a large scale in Ireland, that the peat even on the bog close to where it is collected, stands at the same value as coal, taking heating power and cost into account, viz. 14*s.* per ton. That was before the Irish famine, when wages were greatly lower than they are now in Ireland. At the present moment the relative value of peat fuel to coal is probably about 17*s.* per ton.

2142. (*Earl Donoughmore.*) That is to say that if you could bring coal at 17*s.* per ton it would be more advantageous to use imported coals than to use peat?—It would. In point of heating power they would be alike; but in actual use at 17*s.* per ton, coal would be the cheaper, because the labour expended in handling, required for using peat as fuel, is enormous. It burns so fast that the reduction of heating power due to almost constantly keeping open the furnace door, to keep up the fire, is considerable, so that this and the amount of labour required form serious elements to the disadvantage of the peat itself.

2143. (*Chairman.*) That is using the peat as fuel for manufacturing purposes, and not for domestic purposes?—Yes; this comparison as to the value of coal and peat, has been derived from long experience in great mills.

2144. (*Capt. Galton.*) Do they use peat on railways?—Peat has been attempted to be used on railways, but in its best state it is scarcely available for locomotive engines at all. It so light that it is either blown up right through the tube in broken particles, or goes off in dust. In the compressed state it may be used in locomotives, but not with advantage. Mr. Vignoles and myself were joint patentees in Prussia for a mode of carbonizing peat by the aid of superheated steam. We expected to have done great things with it upon the Prussian Railways, but we found it was an utter failure. The carbonized peat, although pretty hard, had the fault of breaking up into small fragments as soon as it was heated.

2145. How much peat can a man cut in a day?—That will depend very much upon the nature of the bog. The best way in which peat fuel can be procured is to follow the course employed exclusively in the grand duchy of Oldenburg, and in Northern Holland, where peat bog is found in great abundance; namely, not to cut the peat at all, but to take it out in the state of mud, and make it into what they call in Ireland "hand turf," and then let it dry. You thus break up the natural fibres, which greatly facilitates the evaporation of the water. The peat dried in the best manner upon the surface of the bog contains about 25 per cent. of water, and you must burn as much of the fuel as will evaporate its weight of water before the remainder of the peat can be available. When I say 25 per cent., that is the very best which can be procured; in turf made in unfavourable weather, there is often from 30 to 50 per cent. of water. I consider the existence of peat in Ireland is a positive disadvantage to the country, and I believe the best use that can be made of a large portion of the Irish bogs is to burn up a certain depth from the surface, after drainage, and reclaim them, and turn them into agricultural land. Cutting peat is a sort of work very injurious to the habits of the people, because the season that is occupied in cutting the peat is the spring of the year, when the dry weather is precious to the husbandman, and ought to be employed in labouring in the fields. It is at best a sort of idle gossipping work. Men and women engaged in cutting the turfs, spreading them, and turning them over, are really only half employed.

2145*a.* (*Lord Donoughmore.*) Is it possible to burn the surface of bog to any depth?—Yes. I have ascertained that it is by previous draining, conducted in a proper manner, in ordinarily favourable summers. Where the drainage is deep enough, and the egress for the water secured below the level of the bottom of the drains, the peat dries and contracts amazingly, and can then be burnt to some feet in depth without difficulty. Thus a large portion of the grand canal was executed through bog, merely by draining and letting the original surface subside. This method of treatment, however,, is only applicable in certain cases, burning the bogs universally would be a highly wasteful mode of reclamation.

2146. (*Chairman.*) Ireland possesses a large amount of water power, which is not at the present moment made use of, does it not?—The water power of Ireland is more restricted in its area than is generally supposed. There is a large portion of the middle region of Ireland in which, although there is a great deal of water, there are very few mill sites. The character of the streams is such that natural sites for mills often do not exist, but over almost every portion of Ireland, the character of the streams and land are such as to present facilities for the artificial production at very small cost of mill sites by the impounding of the water. The result of operations of that sort, which have been conducted both in this country and in Ireland, is to shew that for every 500*l.* expended in impounding water in reservoirs, you may impound about 1,000,000 cubic feet. It can be shown that horse-power can be obtained in that way nearly as cheap as you can put down a steam engine, assuming the cost of coal to be 1*s.* per day, of 12 hours, per actual horse power, which is the average at the price of 17*s.* per ton.

2147. (*Earl Donoughmore.*) Would not the consumption of coal in steam engines be very much according to the construction of the boilers?—I am assuming that the engines are well constructed. In engines of 30 horse power or upwards the consumption ought never to exceed 3lbs. per hour per horse power. Power obtained in the way I have alluded to, viz., impounded water power, however, is always liable to serious disadvantages. It obliges the placing the factory where the water power is found, regardless of the proximity or other relations of markets, whereas the steam engine gives us free choice as to the place to locate a manufacture. I come back to this, therefore, that it is all important to get coal into Ireland at a far cheaper rate than it has hitherto been got. I believe by proper arrangements at three of the Irish ports, at one in the north, at Dublin, and at one in the south, for the taking of coal from steam colliers direct, and giving the steam colliers a back freight in mineral produce, and with proper arrangements for low freights along the lines of railways, that coals can be supplied over three-fifths of Ireland, and to

Mr. R. Mallet.

12th May 1865.

2,000,000 of its inhabitants, at a reduction of from 3*s.* to 4*s.* per ton. on the present price.

2148. Making it what?—Making it from 10*s.* to perhaps 12*s.* a ton. I do not think it would in any place exceed 14*s.* per ton.

2149. (*Chairman.*) At the railway stations?—At the depôts established along the lines of railway. At those depôts proper arrangements could be made by which the coal could slide at once into carts, free from breakage or needless labour in handling, and be taken direct to the consumers. The great point to be kept in view is, that there should not be any unnecessary handling of the coal.

2150. (*Mr. Glyn.*) In point of fact using the same appliances that they do in England for that purpose?—Yes.

2151. (*Mr. Hamilton.*) What is the price of coal at the port of delivery, take Dublin?—The price of coal in Dublin now varies from 14*s.* or 15*s.* per ton up to 22*s.* per ton according to the state of the wind. Sometimes with a contrary wind the colliers cannot enter Dublin, and then I have known the price of coal to rise almost to a famine price.

2152. You mean that it cannot be delivered at the railway station at that price in Dublin?—No, I am speaking of the actual price at the quay at Dublin.

2153. It can be delivered at one railway communicating with another railway at the price that it is now?—At the port, and then you must add the cost of taking it along the railway.

2154. For a distance of 60 miles what would that be?—I am satisfied that coal can be delivered at a profit upon the Irish railways at present at a farthing per ton per mile, provided you get back freight for the train, and a halfpenny per ton per mile if the waggons must come back empty.

2155. Have you calculated the scale at which it will be necessary to carry coal in order to carry it at a profit?—Coal could be carried at a profit at that rate if you only have 100 tons in the train; you might have 1,000 tons if necessary.

2156. You say that coal can be carried at present at a farthing per ton per mile if the locomotive only took 100 tons?—That would be so, provided the run was 100 miles or more.

2157. Are you acquainted with the evidence which was given in the House of Commons last year upon the subject of coal traffic to the north on a new line to come in competition with the Great Northern?—In part; yes.

2158. Are you aware that it was then stated that in order to carry coal at a farthing per ton per mile your gradients must not be worse than one in 400?—All I can say then is that I dissent from that calculation. I am quite sure you are not likely to get from railway companies very impartial evidence on such a point.

2159. This is not evidence given by railway companies. It is evidence given by some of the first engineers of the day, Mr. Fowler, Mr. Hawkshaw, and Mr. Bidder. Do you dissent from that evidence?—I do not believe that the question of gradients would at all enter so largely into that question. I may remark that as far as regards Irish railways the gradients are particularly good the country being very flat.

2160. (*Capt. Galton.*) You think that coal can be carried at a farthing per ton per mile if they get back freight for the trains; and a halfpenny per ton per mile if they go back empty?—Yes. It is a fact that at this moment on many of the lines in England coals are carried at a halfpenny per ton per mile, and actually pay a profit of between 200 and 300 per cent.

2161. (*Chairman.*) The present price exceeds what you think it ought to be delivered for into the interior at present?—Quite so.

2162. What means do you propose to take for lowering the price at Dublin? that does not depend on the Irish railways?—No; but it depends upon bringing the coal in in suitable vessels, and discharging them in a suitable way. At present the coal comes up to the quay side, and is discharged into bags by hand labour altogether, and is distributed by carts, except a certain quantity which is discharged by hand over the ship's sides into canal barges in the harbour and is transmitted by the two canals which go out of Dublin into the interior.

2163. Is a very large proportion of the cost of coal in Dublin occasioned by the manner in which it is landed in Dublin, and the character of the ships in which it is brought?—There would be a considerable saving by the use of steam colliers and mechanical coal whipping machinery, to take out the coal by mechanical means in place of hard labour, and place it directly into the waggons on the rails.

2164. Are any steam colliers used in the Dublin coal trade at present?—No, not as yet. At this moment there are steam colliers about to be started. I am the author of a project, of which I believe some notice has been taken before this Commission already with a view to making docks in Dublin in connection with the Dublin Trunk Connecting Railway, sanctioned last Session, for the express purpose of carrying out this vast trade in the coal supply of Ireland.

2165. Do you think it practicable that back carriage could be obtained for the coal trucks which would deliver the coal into the interior?—I do.

2166. How is that to be created?—I think that would create itself, if the freights upon railways were diminished to the figures which I have mentioned. It would enable a number of mineral products of small value relatively to their bulk and weight, to be brought into play, which are at present altogether precluded from use or market.

2167. (*Capt. Galton.*) Are you not aware that in England back freights are never adopted, owing to the delay which arises from the coal trucks having to wait before they can be filled; and that upon all the English lines the coal waggons almost invariably return empty?—The fact is as you say, but I do not see that it forms any precedent. It simply arises from want of proper arrangements, and chiefly from the fact that those country stations at which back freight might be obtained are not properly arranged for rapidly filling return waggons; and it is therefore cheaper on the whole to return them empty than to delay them. But it does not follow that if the stations and traffic arrangements are properly managed that would be the case.

2168. (*Mr. Gower.*) Then you think that with proper appliances the coal trucks would not go back empty in England?—Not to the same extent as they do now. I cannot think England is here a parallel case with Ireland. Time is much more money in England than it is in Ireland. It would be of infinitely less importance to retain a train of waggons for an hour or two in Ireland than in England. Very often in England it comes to be a question of obstructing the traffic, and they must send them on in order to get them out of the way.

2169. (*Mr. Glyn.*) The coal trade is so very large in England that waggons are required as fast as they can return for the removal of coal?—Very likely. That would be a question of having sufficient plant.

2170. (*Capt. Galton.*) It is also a question of outlay of capital to a large extent, is it not?—Yes.

2171. (*Chairman.*) And is there not involved an increased quantity of sidings for the waggons to stand upon?—All these points are of course involved, additional plant, and all that follows from that. Of course you cannot develope a new trade without having the necessary means of doing it.

2172. (*Mr. Horsfall.*) You stated that coal is at present delivered in Dublin at 14*s.*, what would be the additional cost of taking it 60 miles inland?—You must add 60 farthings, or fifteen pence per ton, to whatever may be the price landed at the port and put into the waggons.

2173. Do you give it as your opinion as an engineer that, without reference to the gradients, they can

carry coals at a profit at one farthing per ton per mile, provided they got back freights ?—I think there is no railway in Ireland, the physical features of which would sensibly alter the cost of the transport of coal.

2174. Do you know what the gradients are ?—Yes, I do. I think you will find very few gradients upon the Irish railways steeper than 1 in 60, and those which are steeper are very rare indeed.

2175. (*Mr. Glyn.*) Is the return carriage also to come to a farthing per ton per mile ?—I think the same rate should prevail for both the forward and the return freight.

2176. Do you take the wear and tear of trucks and everything into your calculation ?—Yes.

2177. (*Chairman.*) You have actually gone into the calculation, and have satisfied yourself that coal and other minerals can be carried with a profit at one farthing per ton per mile ?—I have. I do not give the calculation at random.

2178. (*Mr. Hamilton.*) Are you aware what the cost of working railways is per ton per mile ?—I am.

2179. What is it ?—I cannot answer the question in that general form, and I do not think I can answer it at all at this instant.

2180. You are not prepared to give any figures upon the point ?—I will supply them. (*See statement at end of evidence.*)

2181. (*Chairman.*) That rate of a farthing per ton per mile applies to trains carrying at least 100 tons, and going at least 100 miles ?—Quite so. When I say 100 tons, of course I do not anticipate that the train will be of that size, because they will be more than that size, probably from 300 to 500 tons each.

2182. (*Mr. Glyn.*) You put that as a minimum ?—Yes.

2183. (*Chairman.*) With no larger load than that you think it would pay ?—I do.

2184. (*Capt. Galton.*) What weight do the railway waggons carry in Ireland ?—There are no special coal waggons upon the Irish lines, but the goods waggons carry from 5 to 8 or 10 tons.

2185. The guage is 5 feet 3 inches, is it not ?—Yes. It would be advisable that the waggons upon the Irish lines should carry at least ten tons each ; that is, that they should be quite as large, if not larger, than those of the Great Northern.

2186. (*Chairman.*) To what class of manufacturing industry do you conceive that this coal is chiefly to be applied ?—It would enable a number of industries to be better developed in Ireland than they have ever been before. I can illustrate that in various directions. For example, there is scarcely such a thing anywhere in Ireland as a good brick, except in the neighbourhood of Belfast, and perhaps on the property of Lord Enniskillen, and one or two other great proprietors. The result of the existence of bad bricks in Ireland for ages, has been that the Irish bricklayers are the worst bricklayers in the British Empire. A mortar joint of nearly an inch thick is thought to be good work in Ireland. The effect again of the want of good bricks or good workmanship puts brick architecture out of use in Ireland. It is owing mainly to that that the Irish towns present some of the meanest architecture in the world. It is owing to that also that in the cottages of the peasantry, stone and mortar partitions are employed at an unnecessary cost, *i.e.*, when the cottages are of masonry and not of mud. Thus the size and comfort of the building is depreciated by it. The clays for brick-making in all the counties in Ireland, with the exception of five, are of very excellent quality for making first-class bricks, but at present a very inferior kind of clay is frequently employed, as the clay is chosen not so much in regard to its goodness as to its proximity to fuel for burning it into brick on the cheapest terms. It results from this often that the bricks have to be carried to an unnecessary distance. Thus, for example, when the Drogheda Railway was in course of execution the bricks were entirely made at Balbriggan, because the coal could be landed there close to the shore and to the clay-field. The clay there is a highly calcareous clay, and very much too poor in alumina to make good bricks, and so the bricks were of a very inferior quality. I mention that as one illustration.

2187. (*Capt. Galton.*) Would bricks ever become an article of export ?—I do not think bricks would be worth exporting. There are plenty of clays and fuel in England for brick-making purposes, and excellent bricks.

2188. (*Chairman.*) That is one purpose to which coals can be applied ?—Yes, there are many manufacturing purposes to which they may be applied also, in fact, coal is the obvious basis of all manufactures—coal and power together—power as the means of giving movement, and coal as the means of transmuting matter by change of temperature.

2189. Are there any other manufactures that you have especially looked to as being likely to arise in Ireland with an increased importation of coals ?—There are. It has been commonly said that Ireland can never be a manufacturing country, that it has been destined by providence to be merely an agricultural one. That is not true. There are certain classes of manufactures where the proportion of fuel consumed is very great in relation to the manufactured product, which cannot succeed in Ireland ; for example it would not be possible to establish crown glass works, where a ton of made glass requires eight tons of coals. It would not be possible to establish copper smelting works in Ireland, because a ton of copper requires about 15 tons of coal ; nor would it be possible to make iron in Ireland, where about five tons of coal are required to produce a ton of made iron. But there are a number of manufactures which might and ought to succeed in Ireland where the quantity of coal required is much smaller in relation to the value of the manufactured product.

2190. What manufactures are those you are speaking of now ?—I may mention *en passant* in connection with the late brick question, that drain and roofing tiles and other things, as well as coarse pottery and earthenware, such as would suit the wants of the agricultural labourer, might be made with advantage. I will now mention one or two sources of manufacture which might become large ones in Ireland in relation to coal, and in relation to its mineral products also. At this present moment, or at least very recently, for various public works in Ireland hydraulic lime was brought from Halkin Head, from Aberthaw, &c. There exist in the middle limestone of Ireland, in what is called in Ireland the calp series, large numbers of beds of limestone quite of the same character as the Aberthaw. That was ascertained by an elaborate train of experiments by a member of the Board of Public Works in Ireland several years ago. A very large trade in that Irish hydraulic lime might be developed by lower freights. Artificial cements having all and more than the qualities of hydraulic limes, and of the nature of the Portland cement which is made here, might become a manufacture in Ireland. The Antrim chalk, in some places, consists naturally of a chemical compound of silex and lime, and such silicious chalk burnt and ground, with the addition of colourless clay, in fact, if the process which is employed for obtaining Portland cement here were employed upon the materials naturally existing there, a large trade might be made in a very superior cement equal to the English Portland cement in setting quality, and far superior in point of colour, for it might be made perfectly white. Pottery and earthenware works might be developed in Ireland with profit and advantage. I have been informed by Messrs. Kerr, of the Worcester Potteries, who are large dealers in earthenware in Ireland, that the loss from the breakage of earthenware sent into the interior of Ireland amounts to something like 1-6th of the value of the article. That loss alone would offer a considerable inducement to the production of earthenware in Ireland. There are some of the very finest porcelain clays existing in Ireland. I discovered myself a porcelain clay at Howth

Mr. R. Mallet.
12th May 1865.

not many miles from Dublin, which we use in our works for making crucibles for melting brass and copper, and which has since been so employed by many others. Similar clays to that exist in many parts of Ireland from which earthenware might be made in Ireland, through which not only the habits of the people might be greatly improved, but a certain amount of wealth produced for the country ; to do that it is indispensable to have coal at lower prices than they have it now. I have directed my attention, in the evidence I proposed to give, rather more to the question of the actual back freights which could be at this moment obtained, than to the developement of new or special works.

2191. Will you give your opinion as to the back freights that could be obtained ?—I will just mention a few as an illustration of those materials which exist in Ireland beyond question in sufficient abundance, and which by ready means of communication and lower freights could be brought into play. Sulphur stone or sulphur ore is exported from Ireland. The greater part of it is sent from Wicklow or Arklow. Some years ago it was attempted to export sulphur ore at the time of the Sicilian monopoly from a place called Silvermines in the interior of Tipperary, but it had to be given up on the ground of the expense of transport. The material was undoubtedly valuable, and there was no end to the market which could be obtained for it ; but it was not valuable enough to be able to pay the inland freight and sea carriage afterwards. If they could get it transmitted at the low rate of one farthing per ton per mile it would become a valuable commodity. Sulphur-stone is not of the same degree of importance now that it was at the time of the Sicilian monopoly, but still it is a material capable of being made available. At this moment vast quantities of sulphur-stone come from Germany. I had to report upon some very large deposits existing in the neighbourhood of Minden whence large quantities of ore now come to Newcastle. If it can be brought from that district there is, *à fortiori*, no reason why it should not pay to bring it from Ireland.

2192. Is not the German ore richer than the Irish ore ?—No ; iron pyrites always give the same quantity of sulphur unless mixed with inert material which is not the case with the Irish stone. I do not think the German stone has got any special advantage over the Irish stone, unless it be that the Irish stone contains arsenic, while the German stone is free from it, and produces a vitriol which is free from arsenic. There is a great deal of ironstone in the county of Leitrim and elsewhere in Ireland, and there is also hematite as well as clay ironstone. At a place called Arigna, in Leitrim, there are several beds of ore which are quite as good as the black band, which could be sent at a profit into England and even Scotland if they could reach the coast at a very moderate rate.

2193. (*Capt. Galton.*) At what rate ?—I think a farthing per ton per mile would enable them to be brought into market at present.

2194. They would go to Belfast ?—They would probably go to Belfast and probably to Newry.

2195. (*Earl Donoughmore.*) The richer district is on the edge of Lough Allan ?—Yes.

2196. Is there not a communication to that by means of the Shannon ?—Yes, but water communication by means of the Shannon is of no use for the transport of these ores. I do not say it might be of no use in connexion with railways, but then you would have double handling. What is essential is, that there should be railway sidings right into the iron ore quarry, and that the ore as taken out should be put directly into the waggons, and that without a change of waggons or handling a second time it should reach the port of shipment, and then be mechanically put on board. I do not think it is likely that iron will ever be made at Arigna. The quantity of coal there is very limited, and the character of the coal is bad, but the coal that is there might be made available for roasting ore so as to reduce its bulk and weight, so that in that shape the ore might be transmitted even at a still better rate of profit than it could be in its raw state.

2197. Have you ever known iron attempted to be smelted with turf fuel ?—Every attempt to smelt iron with turf fuel has ended in utter failure. It cannot be done. It has been tried by the ablest metallurgists in the world, by the Germans, over and over again, and they have given it up as a failure. After the pig iron has been once obtained every subsequent process can be performed with peat. You can puddle iron with peat ; you can roll bars with peat, and do everything with peat except smelt iron ; that is not possible, for the fuel is too fragile to "bear the burthen" in the blast furnace.

2198. (*Capt. Galton.*) Why cannot you smelt with it ?—You cannot get peat into the condition to, what is technically called, "bear the burthen." In the blast furnace peat crushes under the weight of the iron-stone and flux, and the furnace gets "gobbed," or it so reduces the temperature that you cannot make iron. Hematite exists in large quantities in the county Tyrone, where I may also state that there are enormous deposits of sulphur-stone which have as yet been absolutely untouched. At Sawell mountain, in the county of Londonderry, between Maghera and Newtown Stuart there are beds of iron pyrites of great magnitude and thickness.

2199. (*Chairman.*) Is the hematite of a rich description ?—The hematite is not so good as that from Cumberland, but it is very good, and quite as good as a large quantity of the hematite which is smelted in the west of England. I should think it would fetch in the English market, delivered into the ironworks, from 12*s.* to 15*s.* per ton. There are also in the south of Ireland, in the county of Cork, beds of brown hematite containing a large quantity of manganese ; these are, in fact, iron-ores very rich in manganese. Attempts have been made to get them into the market to form oxide of manganese for bleaching purposes, but without success.

2200. What part of the county of Cork ?—They are in the southern part of the county. These ores if smelted would produce iron highly valuable for producing steel, owing to the large quantity of manganese that they contain, I believe these ores would find a ready market in England.

2201. Are they not worked at all at present ?—I do not think they are worked at all. They have been attempted to be worked for the oxide of manganese, but without success.

2202. (*Mr. Glyn.*) To what has the want of success been due ?—They are in fact relatively poor in manganese ; therefore, for the purposes to which oxide of manganese is applied, they are a very bad material, for oxide of manganese, almost chemically pure, is not largely imported. I may illustrate this point of mineral resources further by noticing the fact that on the north west coast of Ireland, in the neighbourhood of Donegal, there is to be found sand of remarkable purity for making glass ; in fact, it is so pure that glass made from it is very much better than that made from the Dorsetshire sand or any sand that they are in the habit of using in England. That sand is at present absolutely isolated from use ; it would not be worth while to send round to a wild west coast without a harbour, and bring it by ship to any glass manufacturing place. But if that sand could be brought by rail to Newry or Belfast or Dublin and transported across to Lancashire it would be considered a precious commodity in the plate glass works at St. Helens and elsewhere. It would improve a trade which exists to a small extent in Ireland already, namely, the making of wine bottles. Our British wine bottles are a national disgrace to us ; they are the ugliest and worst glass bottles in the world, as all know who have seen foreign wine bottles. The French bottles are made from the sand of the Paris basin and other sands of the tertiary formation. This Donegal sand is almost chemically pure silex,

and is superior to any foreign sand that I am acquainted with. In the range of mountains north of Newry there exists white granite ; it is a very beautiful building stone which of itself might become an article of transport if the rates were lowered. The marbles of Ireland are very various and valuable, but they are almost unwrought. Both the white granite and the white limestone, as building stones, and the marbles, might be sent, if the rates were low, as back freight to Swansea or to Lancashire, where coal is raised and shipped in return. I may also observe lime for agricultural purposes could be greatly reduced in price in Ireland provided there were cheaper modes of transit.

2203. (*Capt. Galton.*) What is the price of the lime ?—In Ireland it is from 6*d.* to 10*d.* a barrel. A barrel is about five cubic feet.

2204. How many bushels would that be ?—It would be about seven or eight bushels. We burnt lime for a considerable length of time for our own works. We burnt it with the "breeze" or refuse coke from our iron foundries, and we could produce lime at the kiln's mouth for about 3¼*d.* per barrel, prime cost. There the fuel I might say cost nothing because it was waste fuel, or that which could not be used for any other purpose. The price of lime I understand at present is as low as 6*d.* per barrel in some parts of Ireland, at least so I have heard, but I cannot say so from my own knowledge, having been resident out of Ireland for some years ; but I know that lime could be bought five or six years ago at 10*d.* per barrel in various parts of Ireland.

2205. (*Chairman.*) You are not looking to lime as an article of traffic upon the railways, but as an article the cost of which might be greatly reduced by having coals cheaper ?—Yes. Turf is most expensive to use for burning lime, it takes about 25 cubic feet of turf to burn a ton of lime. Returning to other mineral products, there are many portions of Ireland from which flagging of very valuable kinds could be obtained if transport were cheaper on railways. At Mountmellick there are sandstone flags of great hardness and good appearance, and they can be got of extreme soundness, but they are almost unknown in the market at present. I know of but one instance of their having been largely used lately, namely, by Mr. Guinness for flooring St. Patrick's Cathedral, Dublin, after its restoration by him. The Yorkshire flags are imported at the present time into all parts of Ireland.

2206. Are there a good many Carlow flags used in Dublin ?—Yes ; the Carlow quarries might be better developed than they are. At this moment the streets of Dublin are being paved with paving sets obtained from Penmanmaur in Wales, whereas they might have obtained them within 40 miles, in Carlow county, and quite as good, if they had had the intelligence to look after them. There is no doubt with reference to the development of these things that you have got to deal with a country in which the lower classes are absolutely ignorant of even the rudiments of technical education. This is one of the very reasons why I conceive a reduction of the freights upon the Irish railways for passengers as well as minerals, would be of importance. Lord Bacon himself recognised travel as one of the most direct modes of education. I think it would have a decisive effect upon the peasantry of Ireland if they could travel about more freely, and so learn more what their neighbours are doing. It is very rare at present that they ever go 10 miles from the place where they were born.

2207. Has there been any tendency heretofore towards the development of these branches of industry ?—There have been desultory attempts at different times, but very slight. Ireland has been unfortunate with regard to its industrial developments from the want of technical knowledge displayed on the part of the promoters of projects. About 15 years ago a company was established in Dublin for making crown glass, and I was requested to become a shareholder. My reply was : When you can show me that you can make crown glass without using eight tons of coal to a ton of glass I will become a shareholder. No one who had the very rudiments of technical education could honestly attempt making crown glass in Dublin ; it is not possible that it could pay.

2208. (*Mr. Ayrton.*) How far are these flag-stones from any railway ?—The Carlow flag-tones must be from five to six miles, and those at Mount Mellick must be double that distance if not more, but flag-stones and other mineral produce of an extremely low value in relation to weight will not pay for carting five or six miles, nor even for carting at all.

2209. You want a railway made into the quarry ?—What is wanted is a tramway made from the quarry to the railway.

2210. How deep are the flagstones in the strata ?—The Mount Mellick stones are found quite near the the surface. The quarries are extensive, but of small depth. The Carlow flagstones are found by digging into the side of the hill. Again at Kilrush, on the Lower Shannon, there are flagstones of considerable value, which are employed at Limerick and the immediate neighbourhood ; but they are not known anywhere else.

2211. How far are they from the water ?—They are but a moderately short distance from the waterside, they are brought up the Shannon and carted from the waterside to Limerick. The latter distance is small. The Valentia slate has been acknowledged as a material of extreme value as a constructive material, but comparatively little use can be made of it from the fact that it is isolated where it is.

2212. (*Chairman.*) Is it a good slate for roofing purposes ?—It is not used for roofing at all, it is in slabs, it is not a fissile slate, it does not split.

2213. Do you know of any slate quarries in Ireland which produce slate for roofing purposes ?—There are several. I was pleased at the Industrial Exhibition of last year at Dublin to see roofing slates produced from no less than eight localities, some of them were very fair slates. The Killaloe slates are not bad ; there are some slates in the county of Wicklow which are very good. But the finest slates in Ireland will be found in Kerry, where the beds have received a greater amount of compression and where the lamination produced by compression has been most perfectly and regularly developed.

2214. (*Earl Donoughmore.*) If you were consulted by any person about to build a large building in any part of Ireland, would you not recommend him to employ Welsh slates in preference to the Killaloe slates ?—I certainly should prefer Bangor slates to the Killaloe slates, for this reason, that the latter slates are a good deal the heavier ; but that arises partly from the Killaloe quarry not being worked to a sufficient depth. There are thousands of buildings in Ireland which have no better roof than thatch, and although Irish slate may be inferior to Welsh, it would be important to develop the trade in these roofing slates, because it would obviate the necessity of these cottages being covered with thatch, which is at once the worst and dearest of all roofs.

2215. I suppose you will admit that no landlord in Ireland in these days would think of building a new house and thatching it. Would he not roof it with slate of some kind ?—Yes. I think even Welsh slate would be found to be a far cheaper roof in Ireland.

2216. (*Mr. Ayrton.*) Are you aware that the Irish tramway Act requires all tramways to be made of the same gauge as the Irish railways ?—Yes. I hope to live to see that condition repealed. I think a permissive power to execute railways both for passengers and goods on the narrow gauge would be of importance to many of the poorer districts of Ireland, and many of the districts of the other portions of the kingdom as well.

2217. (*Chairman.*) What do you call the narrow gauge ?—I mean a gauge not exceeding three feet.

2218. (*Mr. Ayrton.*) For slate quarries and all their ancillary purposes, you think there should be

M. R. Mallet.
12th May 1865.

as much freedom with reference to the gauge of the tramways as there is in England?—Quite so; for quarry purposes I should not think that a gauge of about more than perhaps two feet would be desirable.

2219. (*Capt. Galton.*) Would you make such narrow gauge railways in connexion with existing railways through a poor district?—I would make them as feeders.

2220. You would not object to the transhipment that would be necessary?—You cannot avoid that as a necessary consequence of the difference in gauge, but you may mitigate it to the largest extent that mechanical appliances will enable you.

2221. But still the fact of having a narrower gauge for branch lines would necessitate transhipment?—It involves a break of gauge no doubt.

2222. You do not look upon the objection to that as sufficient to prevent your thinking it desirable to adopt it in poor districts?—I do not.

2223. (*Chairman.*) What sort of districts?—I am alluding to Mayo and to the remoter west of Galway. To take one example of the minerals we have been talking of; we have all seen the green serpentine from Connemara. I myself accidentally discovered a serpentine greatly superior to the Connemara serpentine, in a totally different district of the west of Ireland. It is said to be worth 10*s.* per cubic foot in London, but at present quite unapproachable.

2224. (*Capt. Galton.*) But it is a long way from a railway, is it not?—It is miles from a railway.

2225. Could a branch line be made at a reasonable expense?—There would be no difficulty whatever in making a narrow gauge line; and I conceive that in these large thinly peopled and undeveloped regions, those narrow gauge lines should be made not only as mineral lines, but for passenger lines as feeders for the great lines.

2226. What gauge would you adopt?—I should adopt a gauge not exceeding three feet, and probably less.

2227. Does Mr. Fowler propose anything of that sort?—I do not think Mr. Fowler has. Ten years ago I proposed to form a line on the narrow gauge in the neighbourhood of Dublin, but the project dropped through for reasons which I need not detain you with. Since that I understand that Sir John McNeill has seen the importance of narrow gauge lines; and recently at the institution of civil engineers we had a paper read by Captain Tyler, R.E., giving an account of a Welsh narrow guage railway which has been made a passenger line. I may also mention that Col. Yool of the Bengal engineers has strongly recommended the Indian Government to adopt as feeders for the great trunk lines a number of small narrow gauge lines. The vast difference in the cost between a railway of 2 feet 9 or 3 feet and of 5 feet 3 inch gauge is not at all apparent at first sight.

2228. (*Chairman.*) How much saving per mile would it be in your opinion so to construct them?—I can best answer that question by saying that I believe in the west of Ireland, or over any portion of Ireland, in fact, narrow gauge lines might be constructed for from 3,000*l.* to 4,000*l.* per mile.

2229. (*Capt. Galton.*) Then in Ireland you consider that the gauge of 5 feet 3 has been one of unnecessary cost?—No, I do not, I think the Irish 5 feet 3 gauge is the very best in the United Kingdom, but I think that that gauge should not be compulsorily employed for every part of the country. All the great trunk communications should be of that gauge for carrying heavy locomotive engines and carriages; but when you have got a smaller traffic, and a traffic of a character which will bear subdivision, and the narrow gauge is suited to it, then I think the narrow gauge would be more advantageous.

2230. Have you considered what the average cost of transhipping from any of these narrow guage lines to the ordinary gauge would be for minerals?—I have not brought it out into figures, but I have considered what the cost would be, and I am satisfied that it would be very small with proper mechanical arrangements for changing the mineral produce from the waggons of one gauge to that of the other. For example, the small gauge waggon might go up a higher bank and the larger waggon be put below, and the upper waggon might be made to shoot its contents into the lower waggon.

2231. For flags and marbles the expense would be very much greater?—Flagging would admit also of mechanical means of transferring it from one to the other. For example, on the bottom of each narrow gauge waggon there might be an iron grid on which the flags might be laid, and attached to that there might be four hooks, and by means of an hydraulic lift the whole contents of the waggon might be taken up and dropped into the broad gauge waggon. It might be so arranged that the contents of five or six small waggons might be transferred to one large waggon.

2232. (*Capt. Galton.*) Are you aware that the Great Western railway in fact find very great inconvenience from the difficulty of transhipping, with all the appliances they have got, the coal and ores from the very narrow gauge lines which connect colleries and other works with their own broad gauge line?—It is not found to be the case in Durham and Northumberland where the coal is brought up from the pits in trucks running on narrow tramways. Very frequently the coal is transmitted from these over a screen and passes thence into the larger waggons.

2233. It breaks up the coal very much, does it not?—There is a certain breakage, but that depends upon the skill with which the machinery is devised. The coal slips by which, at Cardiff and the Tyne Docks, the coal is caused gently to slide in a continuous stream on board the ships, now scarcely break the coal at all.

2234. Was not the discussion upon the paper read at the Institution of Civil Engineers by Capt. Tyler very adverse to the adoption of the narrow gauge?—I think it was, but there were very few present except myself and one or two others who entered into a discussion of the merits of the narrow gauge at all.

2235. (*Mr. Ayrton.*) After all, each case will depend upon its own particular facts, will it not?—That is true only to this extent, the first element that must fix the gauge for any railway is the amount of traffic and the sort of material to be carried.

2236. And whether it is a hilly country or a flat country?—Quite so. Hilly countries will show themselves most favourable to the narrow gauge.

2237. (*Chairman.*) Do you think that no additional lines are required in Ireland upon the broad gauge?—I think there are some. A general feature of the Irish Railways is that they start like a fan radiating out from Dublin, and there is a great difficulty at present in making your way direct by railway from the north to the south of Ireland, especially in a direction north-east to south-west. If you attempted to send goods from Cork now, and sent them by rail by the shortest connexion of lines along the centre of Ireland, I apprehend they would not reach Londonderry under a fortnight. There have been considerable efforts made of late years to induce the cultivation of flax in the south of Ireland, in order that the flax cultivated there might be sent to the manufacturers of linen in the north. If that were successful (and it has been partially successful so far) it would be important to have the readiest means of transmission between the one and the other, both for those who grow the raw material and those who are concerned in the manufacture. It would be very desirable that the requisite number of links of communication should be formed which would be necessary to unite the northern system and the southern system without those breaks which now exist; but I think it far more important with reference to the extreme west of Ireland, which is not likely to be opened up for a considerable time upon the broad gauge, that it should be laid upon, and connected by means of tramways upon a narrow gauge. More important, however,

than either, is to make the best of the existing system, which is not done.

2238. Have you given much consideration to the cattle trade of Ireland ?—I have considered it with reference to improved means for the transport of cattle. At present the cattle suffer very much, both upon the railways and in the boats, between Ireland and England, and improved appliances and improved management are very much wanted.

2239. Are they as well managed in Ireland as in England ?—I apprehend there is not very much difference. The sufferings of the cattle are very great in both countries. Of course, upon the score of humanity it would be of no use saying a word ; it is merely a question of the value of the meat when it comes to the market. An unfortunate fat ox, or cow, goes up from Tipperary to London, and is kept standing upon a hard plank the whole of the time. The feet of the animal are off the grass, or other comparatively soft and damp substance which he has been standing upon for months, and will not bear the pressure of his great weight resting upon a timber floor, often for days, without intense pain, and the animal suffers very much in consequence, and he loses flesh and value by it. I think the cattle waggons ought to be provided with a stratum of dry peat. I have kept horses myself standing constantly in the stable on peat with great advantage to their feet. The peat might be thrown out of the waggons at the end of one, or after two or three journeys, and would be in itself manure. The droppings of the animals and their urine, which latter is all now lost, would be all mixed with it, and would be rendered comparatively inodorous by the peat, and the hoofs of the animal would be greatly relieved by it. Besides that, there ought to be means by which the cattle could comfortably stand without leaning against one another ; there should be bale-bars between every pair, and there should exist the means of supplying them readily with water ; there should be sidings in which there might be contrived troughs, by means of which the cattle without being removed from the cattle-vans could drink comfortably and without loss of time. The cattle boats are of an extremely defective description. The cattle are driven on board by blows and violence, and they stand either on the deck or confined in the hold. If the sea is rough in the winter-time, those who are in care of them, as well as the seamen, are sometimes afraid to go near them for fear of being crushed to death, and the cattle suffer very much. I have seen cattle arrive in Liverpool with their horns knocked off, and other injuries of a similar description. I have myself designed a special class of cattle boat which I hope to see employed hereafter in the Irish ports. These are boats of a greater beam, drawing a smaller quantity of water, and designed especially for cattle, sheep, and hogs, in which there would be the means for the cattle walking or board, and walking on to the shore. The cattle would be under deck cover, and their drovers would have the means of obtaining easy access to them through the voyage ; the cattle would have the means of lying down, and they would be foddered and watered during the whole voyage, and their manure would be carried off mechanically, so that they should not get covered with it as at present.

2240. (*Earl Donoughmore.*) If those steam boats were specially designed for cattle how would they get back freight from England ?—They could carry bale goods of almost every description, and they might even carry passengers.

2241. You think the peculiar adaption of them would not prevent their being used as ordinary steamers ?—I think not ; they would not answer for certain classes of freight, for instance, it could not be desirable to carry pig-iron in them because that would injure the fittings belonging to the cattle, but manufactured articles coming from England to Ireland might go in them just the same as in the present steamers.

2242. (*Chairman.*) Are you acquainted with the charges for cattle traffic at present in Ireland ?—I am generally acquainted with them.

2243. Are those charges higher than you think they ought to be, so as to be remunerative to the railway companies ?—I should not like to give an opinion upon that point. The cattle trade is one that I am not sufficiently acquainted with to be able to do so. I am clear that the fares for all mineral produce ought to be lowered materially ; I may also say that the fares for passengers ought to be lowered very considerably.

2244. I believe you have some observations to make as to the connexion between the Dairy Farms in Ireland, and the Railway system ?—I may most briefly answer that question by saying that, in the United States the large cities are supplied with milk brought from a very considerable distance by railway trains. The climate of the Northern States is very hot in the summer, and very cold in the winter, which necessitates special precautions by which milk can be brought very long distances by rail. A gentleman of the name of Borden has taken out a patent for concentrating milk to about one-third of its bulk for such journeys ; the process is peculiar. There have been many bygone attempts made in France to obtain a sort of portable milk, but none have been successful hitherto, arising from the want of knowledge of the organic chemistry of milk. This plan of Mr. Borden's has been successful ; he submits the milk in tall cylindrical cans to a temperature of about 190°, until it arrives at that temperature it is kept constantly stirred by machinery in these cans ; the milk at that temperature is withdrawn from the cans by means of suction into a large boiler or cauldron in which by an air pump worked by steam a vacuum can be produced. The air pump is kept going until the aqueous portions of the milk maintained at 190° Fahrenheit are evaporated nearly to two-thirds ; at that point the heat is withdrawn and cold water is permitted to pass outside the vessel where the steam for heating it was applied before, so as to cool the milk gradually. The air pump is still kept going simultaneously with the water process ; the effect of that is that some peculiar fœtid animal ether is withdrawn from the milk which seems the great element by which the fluid becomes putrescent in its natural state. After this has been removed the milk will bear to be transmitted to almost any distance and will remain many days without undergoing any sensible change. New York is supplied with concentrated milk in this form ; they mix it there with two-thirds of water and those who use it affirm that the milk so mixed has a richer taste than it had originally.

2245. Do you think that any trade of that kind can spring up in Ireland ?—I see no reason why the rich pasture land in the South of Ireland and also that in the North-west should not become sources from which a supply of milk to a large portion of the manufacturing districts in the south and north of England and the west and south of Scotland should be brought. By proper arrangements with the railway companies to provide milk trains, I have no doubt that a supply of milk might be sent from Ireland to England which would cheapen the price of milk in England.

2246. (*Mr. Ayrton.*) Do you know the price of milk in Ireland ?—I know some years ago in Dublin, milk was sold at 3*d.* per quart. It is cheaper now than in England.

2247. (*Earl Donoughmore.*) Do you think it would be worth the while of the dairy farmers, in the South of Ireland, who are now making a very considerable profit, so entirely to change their system of trade as to introduce this system of desiccating milk ?—I see no reason why one trade should interfere with the other, I suppose it will be admitted that the production of milk in the South of Ireland might be increased tenfold.

2248. (*Mr. Ayrton.*) Are you acquainted with the relative profits of farming, with reference to selling milk, and making butter, using the butter-milk ?—I had better say that I am not ; although I had 21 acres of grass in the neighbourhood of Dublin, and I found that if I chose to become a milk farmer, and

Mr. R. Mallet.
12th May 1865.

sell the milk, I could have made out of those 21 acres of land a large profit.

2249. Do you know whether it is more profitable for a farmer, within 50 miles of London, to make the butter and use the milk afterwards, than to sell the fresh milk?—I should consider it would have been more profitable within 50 miles of London, to have sold the milk than to have made butter of it. A great deal of the best butter which comes to London, comes from Cambridgeshire.

2250. (*Chairman.*) Have you formed any opinion as to the advisability of a temporary state control over Irish railways?—I think a control by the State, if it compelled the experiment to be tried of reducing the fares and freights, would be valuable and likely to be highly advantageous.

2251. Do you contemplate an Act of Parliament compelling the railway companies to reduce their fares very much below the present rate?—I presume some legislative means would be necessary in order to induce them to do so. I do not think they would have the courage to make the experiment themselves without that, and therefore, I think that amount of control would be necessary. I think it would be disadvantageous that the management of the railways should be at all placed in the hands of the state even in Ireland.

2252. You do not see any prospect of the railway companies themselves making the experiment of low fares and charges?—I think not. The management of the Irish railways betrays the utmost want of energy on all sides. They seem to lay on their backs and let the traffic come to them if it will, and if not, it cannot be helped. They have even shewn occasionally the most marvellous impolicy. Thus, where their freights have been falling off, they have actually raised their charges in order to keep up their dividend, and thus have totally destroyed that which was already a declining trade.

2253. Can you state distinctly to what extent you think the control ought to be exercised over the railway companies, and in whose hands that control should be placed?—I think the control should be placed in the hands of a mixed commission, upon which probably there should be some traffic managers and engineers. They should operate under an Act of Parliament. The lowering of the fares to a certain extent should be compulsory, and then the working of the railway boards of Directors should be merely supervised as it were, by such a commission, so as to be assured that they did their best under the existing new system, to develop their traffic, and did not in fact wilfully or perversely interfere with its operation. Beyond that, I do not think much control would be advisable or necessary, but to do that, I apprehend that a guarantee must be given, otherwise legislation would become a sort of spoilation. If these directors think they shall be at a loss for a time, and they would be at a loss no doubt for a time, you must guarantee them against that loss, although you compel them to make it up afterwards.

2254. (*Earl Donoughmore.*) From what source is this guarantee to be derived?—I think it ought to be derived from three sources; from the railway companies themselves, from the country at large, and from the State.

2255. By the country at large, you mean Ireland?—Yes. I think it ought to extend over a given number of years and be divided in something like this sort of way. I may just state here that when the Midland Great Western started they had fourth-class passenger carriages, but they very soon dropped them, and now they have nothing but third-class passenger carriages. The charges for third-class passengers over a large portion of Ireland are such as almost precludes the Irish peasant from travelling on the railway.

2256. (*Capt. Galton.*) Is it not the fact that it was the same charge as used to be charged by Bianconi's cars, a penny per mile?—Yes, the lowest fares are nearly double what the peasant ought to travel for in the interior.

2257. (*Mr. Ayrton.*) Do I understand you to suggest that this State administration should be on the basis of making the railway system profitable; that is to say, there should be return enough to pay a fair dividend after payment of all working expenses, or would you leave them unprofitable?—My opinion is, make the experiment, and it will be attended ultimately with a successful result. I think that you will create such an enlarged traffic in the course of eight years that the railway companies will not only be able to pay as large a dividend as they do now, but a great deal more.

2258. (*Capt. Galton.*) It would not be fair that the loss which might arise from such a guarantee should fall upon the country; ought not the railway companies to pay that eventually out of their future earnings?—I think that would be scarcely fair. You call upon them to make a great experiment, which they believe will be a perilous one, and which everyone must admit is an experiment.

2259. I am assuming that they will get larger dividends eventually than they get by their present arrangement?—I think it might be fair that if the dividends at the end of eight years were considerably better than they are now, the railway companies should be called upon to recoup the State and the country (that is, Ireland) from any guarantees which it has had to pay in the interval. I doubt, however, if after three years there would be any guarantee to pay at all. I should propose to divide the guarantee into four periods of two years each, and divide the guarantee between the railway companies and the State in the following ratios. During the first two years, the railways should pay three-ninths of the whole, the country two-ninths, and the State four-ninths. For the next two years I should propose that the railways paid four-ninths, the country two-ninths, and the State three-ninths. For the third two years I should propose the railways still to pay four-ninths, the country three-ninths, and the State two-ninths. For the last two years, or to the end of the eight years, the railways should pay five-ninths, the country four-ninths, and the State none.

2260. (*Mr. Ayrton.*) Do you mean that each county is to pay in respect of the railways in that county, or the whole of Ireland is to pay?—I think the whole surface of Ireland should be rated, but it should be rated upon the same principle that the watershed of a district is determined, that is by taking a dividing line between the railways, and that they should pay in some ratio to their distance from the lines.

2261. Do you mean that Ireland should be divided into certain railway areas?—Yes.

2262. Then that each of those areas should guarantee the lines within that area?—That would be one mode of doing it. I think it would be the fairest mode to have a universal assessment based upon this principle, that all land within 10 miles along the line will be assessed at a certain rate, and land within 20 miles at a certain other rate, and outside that again at a third rate; but that some rate should be universal over the whole country. If the tax came to be levied, and if there was a really serious loss, it might be better borne if spread over the whole country.

2263. Would it be right that a district at a distance from a railway should be taxed to support it?—I think so, because it would really be benefited by the railway in proportion to that distance.

2264. How would that district be benefited which is at a distance, unless the railway was used as a means of sending goods?—Assuming the railway to be in operation, I certainly conceive that those who are nearest the railway are mostly benefited by it; but all are benefited more or less.

2265. Would not that depend upon whether he sent his goods to market?—Clearly, a man might be rated who might say I have no interest in this railway, but I should consider him to have an indirect interest, and therefore he ought to pay as well as others.

2266. (*Earl Donoughmore.*) Take the city of Dublin, which is a seaport town, of course there is no part of the city of Dublin which is not within 10 miles of a railway. You propose, by your scheme, that the inhabitants of Dublin should be taxed upon the highest scale. How are the inhabitants of Dublin interested in this question at all? how is it just or fair to call upon them to pay upon the highest scale, when they have no interest whatever in the question?—I cannot admit that they have no interest in the question; on the contrary, I think that every man in Ireland is most vitally concerned in the attempts to make railways available, because in proportion as they are available so is the country prosperous.

2267. I will take the instance of my Lord Pembroke, who is the proprietor of large estates in the city of Dublin, how would the reduction of fares, which would enable coal to be transported to the centre of Ireland, or which would bring serpentine from Galway or sulphur ores from Wicklow, or stone from Kilkenny, effect the value of Lord Pembroke's property?—I might answer that by saying that they would raise the value of his property if they made Dublin more prosperous. But if the rate were an acreable rate as I propose, it appears to me that it would affect Dublin very little more than the other parts of the country.

2268. Then your proposition is that it should be an acreable rate, and not a rate upon the value?—I think so.

2269. So that an acre of poor mountain land, similar to that on the top of the Galtee mountains, would have to pay as much as an acre of rich pasture land?—No, because those mountain lands would be situated a great distance from the railway.

2270. (*Mr. Ayrton.*) Is it not the case that along the Galtee mountains there is a good deal of stony land?—There is some.

2271. Would it be right that this stony land, because it was within the narrow zone, should pay in a greater ratio than the rich fertile land which happens to be in the distant zone, and which would therefore produce probably three or four times as much agricultural value?—It should not only be a rate upon the acre, but the value should be taken as an element. I do not at all pretend to go into the details of how such a tax should be levied, or what might be the exact best mode of assessment. I think it is obvious that the country would be benefited by such a system, and I think it is therefore fair that the country should be called upon to pay its quota towards the risk or expense, and so in some way you must tax it.

2272. Is not the value of the land in Ireland regulated by its distance from ports and large towns?—That is one element.

2273. If you are to carry produce into the country at a loss, and tax the community for that loss, are you not in fact subsidising persons who have less valuable land at the expense of those who have the more valuable land?—I have no doubt that for a time, and in so far as the guarantee would become operative at all, that a certain amount of such apparent injustice would be done; it would be scarcely possible to do it otherwise, but I apprehend that the guarantee itself would melt into an exceedingly small sum when it came to be put into money value. I calculate that the loss could under no possible circumstances reach to more than 80,000*l.* a year.

2274. Would not the immediate effect be to raise the rates of the accessible land, and would not the relation of landlord and farmer, as regards their relative interests, be just as it was before; would not the effect be to raise the value of property, and so raise the rent of the less accessible land?—I think the amount of the assessment would be so small on the acreage that it would be almost infinitesimal, and perfectly without effect in altering the relations of value in land, or those of landlord and tenant.

2275. I am asking you as regards the whole of the land, would not the immediate effect of this be that the landlords would put on in the shape of rent all that the railways reduced in the shape of charge?—It would be the tendency of the landlord to do it no doubt, but he would scarcely find it worth his while to do it.

2276. Is there not such a competition for land as to keep the tenants at what may be called the lowest rate of tenant's profit?—Yes.

2277. Has not that been carried to such an excess that the tenant who is competing for the land will be content with even a less profit than he ought to receive with a view to the payment of his rent; has not that been the character of the relation of landlord and tenant?—That is unfortunately the fact. I do not think it arises so much from excessive rents as from the fact that the rent is not taken out of the land by the application of capital and industry to it.

2278. Has it not been from the extreme competition upon the part of the tenants to get possession of holdings?—In part.

2279. Are you not aware that if the landlord puts his farm up to bid by auction, or what they call in Ireland sets it, that he very often gets an active competition for taking the farm?—Yes.

2280. That being so, would not the immediate result of reducing the charge upon the produce of the land be to put the whole amount of that reduction after the next set of the farm takes place into the pocket of the landlord?—Yes; of course whether it was paid through the landlord in the shape of rent, of paid directly by the tenant, it would be a tax on what came out of the produce of the land, which is the source from which this and all taxes must come.

2281. Then the effect of the transaction would be this, that we should, out of somebody else's pocket put a great deal of money into the pockets of the landlord of the less accessible parts of Ireland?—I do not think practically that would be the result, for my impression is that, the guarantee would be found to be merely a just preservative against a possible contingent evil, but one that would to a very small extent come into play at all. I apprehend that after the first three years there would be no loss. I think it very questionable whether upon passenger traffic there would be any loss at all even at the very commencement.

2282. (*Chairman.*) To what extent do you think the passenger fares ought to be reduced?—I think the first and second class passenger fares ought to be reduced one-third if not one-half. The third and fourth classes for the working population I think should be reduced one-half, which would bring them to about a level with the continental Prussian, German, and French fares.

2283. (*Mr. Gower.*) Do you conceive there would be any danger, if you were to guarantee certain existing interests, of there being a great addition to the expense of the management of railways?—It is to guard against that, that I think Government control would be indispensable.

2284. (*Capt. Galton.*) What do you mean by Government control?—I mean that the working expenses of railways, their books, and their mode of conducting their business should be open to the inspection of competent Government officials at all times, in order that they may see that they were not engaging in reckless expenditure.

2285. Would not that fetter the whole of their proceedings most enormously? Would not that be practically taking the whole affair into the hands of these Government officials, or else referring every question to some central board to say whether anything can be done or not, and so create great delay?—I do not see that much difficulty of that sort would arise. I would only exercise a negative species of influence over the companies; I would not control their proceedings beyond a certain point.

2286. The question was whether the company would not be likely to be more careless in running their trains if there was to be this guarantee given to them. Suppose they put a train which was in the

Mr. R. Mallet.
12th May 1865.

opinion of the government official not likely to produce full receipts, would he not be likely to stop that train, or would it not be taking away entirely the responsibility of the company if you fettered them by means of a government official?—Some sort of ultimate appeal might be necessary, but I think the government official's duty should be, in the first instance, merely to point out in such a contingency to the railway company, "You are putting on a train here which I consider to be extravagant and useless; you must modify it in some way." Of course it is very easy to multiply supposed difficulties to the working of any plan, but I apprehend in practice there would be no serious difficulty felt.

2287. (*Mr. Ayrton.*) Do you think it possible, if any loss was to be paid out of these rates, to have any specific contract made for any particular district, or would not the railways have to be placed under some general rules as to uniform mileage rates to be rigidly enforced all through the country?—Yes, I think there ought to be uniform rates established throughout the country for special classes of merchandize and passengers.

2288. Would not the whole system have to be managed under a set of public rules in which the subordinate officers would not be allowed to make any change or modification?—Clearly there should be some such rules, which I conceive, if judiciously drawn up would greatly avoid mere questions of detail.

2289. Do you think the effect of the officers working under those general rules, not being allowed any discretion, would or would not be to lead them into a more formal mode of conducting business, like as government business is generally conducted without any energy or enterprise and very little skill?—Of course you would bring in that element more or less; but I apprehend if the controlling power was one in itself exercising discretion and energy, that the difficulties would be very much less than they appear. I have always remarked that in any new project it is very much easier to find supposed difficulties than it is to vanquish them when they come in your way.

2290. Is not the tendency of all government administration upon a system of method and rule and general order, just the reverse of that which is supposed to be characterised by private enterprise?—That is not found to be quite universally the case, in Germany for example, where every branch of industry is, more or less under government control, yet the Germans are not deficient in individual energy, nor do they lie helpless on their backs waiting for providence, nor is the control found to degenerate into officious interference.

2291. Do you think that the absence of effective industry in Ireland results in any degree from the habit the people have acquired of relying on the State for so many things rather than relying on their own industry?—There was a feeling of that kind which had grown up many years ago, when a large portion of the population of Ireland, before the Famine, was employed upon public works as a means of finding employment for them, but I think that has greatly diminished of late years.

2292. Is there not a Board of Works in Ireland through which the Government undertake to do a great many things which in this country are done by local enterprise?—The functions of the Board of Public Works in Ireland are almost identical with those of the Office of Works here, and it has a central bureau in Dublin which to a certain extent controls the expenditure on all works connected with the State. There are very few things going on now in the shape of public works that could be done by private enterprise.

2293. Is not the drainage of Ireland going on?—The drainage is now all over. The landlords put an end to it, but they are beginning now to find out that they had better have left the Arterial Drainage Act alone, the want of which, in operation, they now feel.

2294. Do you think that the effect of the system to which I have alluded has been to direct the minds of the Irish people to State assistance rather than to their own enterprise?—I think more has been made of that than is true.

2295. Do you think that the introduction of Government control over railways would tend to develope that private enterprise which you say is dormant, or the reverse?—I do not think you will have any rapid or great development of the industry of Ireland coming from the Irish people themselves, but if by altering the rates of freight on these Irish railways you were in a position to show that they could improve their condition by employing the material that Providence has thrown at their feet, and putting it into trucks for England, I think you would give them an incentive to follow our example here.

2296. Would not that be an indirect way of giving a bounty to any particular branches of industry if you carried goods at a less charge than would allow a profit to the people engaged in them?—Apparently so. I am ready to admit that the whole thing seems to conflict with theoretical political economy, but I do not think that theoretical political economy will turn out to be applicable to the facts in this instance.

2297. Do you think it possible if all the railways of Ireland were amalgamated into one system, or two or three large groups, that capitalists might be found who would be willing to lease the lines for a term of years, trusting to make their own profits from a better system of management, and a greatly increased traffic from a general reduction of charges?—I think that is not at all impossible. I say in answer to the first part of the question, that it would be of the utmost importance to amalgamate the lines, on account of the inconvenience which results at present from there being a number of little separate systems, for example, if you travel from Dublin to Belfast at present, you pass over what is in itself a continuous and not a very long line, and yet you travel through three if not four distinct railway properties, each with its little imperium of directors and officers, &c., and you are tormented at every hour to show your ticket, because you must show it at the end and at the commencement of every new property.

2298. (*Earl Donoughmore.*) Has such a plan as this ever occurred to you? Supposing that the Government were, by making acceptable propositions to the shareholders of these 18 companies in Ireland to become the proprietors of all the railways in Ireland, of course then they would become responsible for their obligations, and would become possessed of their assets; and then the State, having so made themselves the masters of the property, were to enter into an arrangement with a company to work and manage the lines upon certain conditions; first, with respect to rates for passengers and goods traffic, and also with reasonable accommodation to the public by the number of trains to be run in the day, and other conditions of that character, upon a lease for a certain fixed number of years: do you think it would be possible to get a great company to undertake that management on payment of such a rent to the Government, that they would be able, although perhaps losing something in the first period of the term, to recoup themselves in the latter period of the term in case there was a loss. I suppose the rent to be a rising rent?—I think it very likely that such an arrangement could be brought about. It would look a more symmetrical arrangement, probably than that which I have imperfectly sketched of a guarantee, but it would practically amount to the same thing. It would have to be a guarantee in any case. As regards the theoretical political economy of the thing, it is six of one and half-a-dozen of the other. If the Government became possessed of the railways, and assumed the responsibility of the companies, they must do either one of two things: they must either give leases at a low rent, which is tantamount to giving a guarantee, or they must take a reasonable rent as derived from corresponding traffic in England, or based upon the English lines, or upon the existing state of things on

the Irish lines, and then they would have to give a guarantee to the losses for a certain length of time.

2299. You are aware that a great portion of the capital which has been employed in making the Irish railways is borrowed capital, that is, capital raised up on debentures?—Yes.

2300. Upon that capital the railway companies are now paying a comparatively high rate of interest? —There would be no doubt considerable advantage in having the Government responsible for the interest, produced by the difference between paying a high rate and a low rate of interest.

2301. If the Government were to become the proprietors of the railways and responsible for their debts, as these debentures fell due the Government would be able to float them in the market at a far lower rate of interest than the companies themselves could ever expect to do?—Yes.

2302. Therefore, in that respect, as time went on, the Government would make a saving every year?—Clearly.

2303. That would be one source from which in time they would expect a reduction in the charges? —Yes.

2304. Then might it not be so arranged that the rent payable by the managing company to the leasing company should be a rising rent, perhaps not the first year or two, but rising gradually at fixed periods. Do you think it might not be possible, taking into consideration those two elements, first, a reduction of the charges arising from the debentures being gradually floated in the market at a lower rate of interest, and, secondly, the periodical raising of the rent payable to the company, that at the end of 21 years the Government might find itself entirely recouped? —I think the Government would find itself recouped, and probably within a shorter period, but I apprehend there would be found considerable difficulty in getting railway companies or proprietors who would speculate in Irish lines if you made such a reduction in the fares as would alone be likely to make the experiment successful in the end. If you were to reduce the fares to one-half or one-third of what they are now, I dare say you might still get them to undertake it, but I think they would undertake it only upon terms commensurate with the risk.

2305. I understand from your last answer that you do not feel quite so sure that the experiment of the reduction of the fares to half would be successful?—No. What I have just stated is not from any doubt on my own part as to the effects of the change, but from the difficulty of convincing those whose knowledge must necessarily be imperfect, and who would have the risk of advancing the money, and would take care to secure terms commensurate to their greatest supposable risk.

2306. (*Mr. Gower.*) I suppose you consider that on every railway a reduction of fares would prove advantageous?—I think so. I am quite satisfied that on some of the lines the effect would be almost electrical. Perhaps upon others the effect would be much slower, but I apprehend that within three years the advantage would be without question.

2307. But still you would recommend the same reduction to all railways?—I think in Ireland, to which I have alone referred, you would have to establish uniform rates both for goods and passengers all over the country. I do not see upon what principle you could take any other method.

Statement referred to in the Answer to Question 2180.

COST of WORKING COAL or MINERAL TRAINS.

Each train consisting of 30 waggons, with break-van, for a nett load of 200 tons average.

Cost of transport per train mile.

	Pence.
Locomotive power	9·50
Maintenance of way	1·00
Attendants on train	1·00
Use, wear and tear of waggons	3·50
Signal lamps	0·50
Offices and general management	1·00
Cost per train mile on a level	16·50

As the mean co-efficient of traction for waggon trains in good order is $\frac{1}{270}$, the only effect on the above of a gradient is proportionately to increase the consumption of fuel. The cost for fuel only per train per mile, included in the part mentioned above, (coal being at 14*s.* per ton), is 2·60 pence.

Hence we shall have with a gradient of 1 in 270. The cost per train mile - - - Pence $16·50 + 2·60 = 19·10$

Or with a gradient as steep as 1 in 90 - - $16·50 + (3 \times 2·60) = 24·30$

But the return on the nett load of 200 tons at one farthing per ton per mile is = 4*s.* 2*d.*

So that on a level line the nett profit returned will be—

pence. pence. pence.

50 — 16·50 = 33·50 or rather more than 200 per cent., and upon a continuous gradient as steep as 1 in 90—

pence. pence. pence.

50 — 24·30 = 25·70 or rather more than 100 per cent.

If the trains as proposed carry coal one way and return filled with minerals, the same rate of profits will be returned for the double journey, or each way.

If however the waggons return empty, the cost of return transport may be taken as follows:—

Engine and empty train per mile,—

Locomotive power	8·00
Maintenance of way	0·80
Attendants on trains	1·00
Wear and tear of waggons	2·00
Signal lamps	0·50
Office of general management	1·00
Cost per empty train mile on level	13·30
Or with a continuous gradient of 1 in 90, add	5·50
Pence	18·80

It is thus obvious that with such coal trains, returning empty waggons, a freight charge of less than one halfpenny per ton per mile would yield an ample profit.

Adjourned to Wednesday next at 12 o'clock.

Wednesday, 17th May 1865.

PRESENT:

THE RIGHT HON. THE EARL OF DONOUGHMORE.
THE HON. E. F. LEVESON GOWER, M.P.
THE RIGHT HON. ROBERT LOWE, M.P.
SIR ROWLAND HILL, K.C.B., F.R.S.
T. B. HORSFALL, ESQ., M.P.
ROBERT DALGLISH, ESQ., M.P.
GEO. CARR GLYN, ESQ., M.P.
A. S. AYRTON, ESQ., M.P.
CAPT. DOUGLAS GALTON, R.E., F.R.S.
E. T. HAMILTON, ESQ.
J. R. M'CLEAN, ESQ., Pres. Inst., C.E.
WILLIAM POLE, F.R.S., *Secretary.*

HIS GRACE THE DUKE OF DEVONSHIRE, K.G., F.R.S., IN THE CHAIR.

MR. JOHN RICKARD TINSLY examined.

2308. (*Chairman.*) You are mayor of Limerick? —Yes.

2309. Are you connected with the Chamber of Commerce in that city?—Yes.

2310. Has its attention been turned to the accommodation afforded by the railway companies and the fares charged upon them?—Yes.

2311. Has the Chamber of Commerce any com-

Mr. J. R. Tinsly.

17th May 1865.

plaint to make as to the accommodation or as to those fares ?—They have not authorized me to make a complaint.

2312. Has the management of the Irish railways been under the consideration of the Chamber of Commerce, and have any faults been found with respect to the traffic to Limerick ?—It has not been under the consideration of the Chamber of Commerce as a body, but the directors of the Chamber have had the subject under consideration, and requested me to appear here to give my impressions upon it. The members have considered the matter amongst themselves individually.

2313. Have you individually any cause to complain of the arrangements on the Irish railways ?—Yes.

2314. Will you state generally to the Commission on what points you have to make complaint ; first as to the passenger traffic ?—With respect to the passenger traffic, it is generally complained that the charges are too high, which prevents that intercourse with the western districts of Ireland that we would otherwise have if we had a lower rate upon the traffic from the metropolis and a lower rate of passenger charge.

2315. Do you ground your opinion that the traffic would be much increased by lower fares upon any facts, or, speaking generally, is it your opinion that low fares would naturally have that effect?—That is the general opinion of the gentlemen with whom I have been speaking and also my own.

2316. Have any experiments ever been tried between Dublin and Limerick with a low scale of charges ?—Not that I can recollect.

2317. What is the fare from Dublin to Limerick ?—23*s.* 8*d.* first-class.

2318. (*Mr. Glyn.*) What is the distance ?—I think the distance is about 129 miles.

2319. (*Lord Donoughmore.*) By which route do you mean ?—By the junction.

2320. (*Capt. Galton.*) What is the distance by the Roscrea route ?—I have not got the particulars of that.

2321. (*Chairman.*) What is the second-class fare ?—17*s.* 8*d.*

2322. What is the third-class fare ?—10*s.* 9*d.*

2323. In the opinion of business people at Limerick is there a sufficient number of trains each way daily ?—We want a four o'clock train from Dublin to Limerick ; the train at present leaves at one o'clock and arrives at half-past six, and the persons engaged in trade travelling from Dublin consider it a very great inconvenience to be obliged to leave so early, or they must wait till a late hour.

2324. (*Capt. Galton.*) Can you leave Limerick in the morning and go to Dublin and return in the evening ?—No.

2325. At what time does the morning train start to Dublin ?—The general train is the 11 o'clock mail train.

2326. How many hours is that going to Dublin ?—There is a delay of two hours at the junction ; it gets to the junction at 20 minutes past 12, and remains there till the Cork train comes up, and it is a late hour in the evening when it gets into Dublin. I have travelled by the four o'clock train, and it gets to Dublin at half-past nine, taking five hours and a half.

2327. Is there a morning train to Dublin ?—Yes, it leaves at 6 o'clock in the morning.

2328. When does it reach Dublin ?—It is due, I think, at half-past 11.

2329. There is no train which travels between Limerick and Dublin in less time than five and a half hours ?—No.

2330. (*Chairman.*) Going a distance of 130 miles ?—Yes.

2331. (*Mr. Glyn.*) You cannot return the same afternoon, can you ?—Yes.

2332. What time can you leave Dublin ?—At one o'clock.

2333. You only arrive at half-past 11 by the first train, and you must then leave at 1 in order to return ?—If you return the same day you should ; but in fact I do not know of anyone going up in the morning from Limerick and returning the same day ; you cannot do it, you would not have time to transact business.

2334. You cannot return the same day ?—Not since the four o'clock train was taken off ; there was a four o'clock train that landed passengers at half-past nine in Limerick.

2335. (*Lord Donoughmore.*) There is a night mail train to Limerick ?—Yes.

2336. (*Capt. Galton.*) When does it leave Dublin ?—I cannot tell you the exact hour ; it is after the arrival of the Kingstown mail.

2337. (*Mr. Glyn.*) What time does it reach Limerick?—At half-past one in the morning.*

2338. (*Mr. Horsfall.*) Do they issue return tickets upon that line ?—They do for the same day.†

2339. But they are comparatively valueless, are they not ?—Yes.

2340. (*Chairman.*) Do you believe that any large number of persons in Limerick are prevented from going to Dublin for want of sufficient railway facilities ?—Yes ; I think that a great many persons would travel to and from Dublin if there was a lower rate of charge.

2341. (*Lord Donoughmore.*) If they could return the same day ?—Yes.

2342. (*Sir R. Hill.*) Why was the four o'clock train discontinued ?—I do not know.

2343. Were there many passengers who travelled by it ?—Yes, a great many.

2344. (*Mr. Glyn.*) Is there much intercourse between Dublin and Limerick ?—Yes.

2345. Would that be increased, in your opinion, if facilities were afforded for a daily return train to and from those places ?—Yes.

2346. Is Limerick a market that the Dublin people look to very much ?—There is a great deal of business done between those two places.

2347. (*Chairman.*) Is there much communication between Limerick and Cork ?—There is.

2348. Are the trains convenient between those two places ?—Yes, they are.

2349. More convenient than between Dublin and Limerick ?—Yes.

2350. Do you attribute the want of accommodation to the means of communication being in the hands of two different companies ?—I should suppose that it would be more convenient if the matter was in the hands of one company, and that it would be more easily arranged.

2351. Between Limerick and Waterford what accommodation is there ; are there as many trains as you want ?—I believe so ; there is not much passenger traffic between Limerick and Waterford.

2352. And perhaps there never will be ?—I do not know that ; it may be promoted. I have not heard any complaint of want of trains.

2353. (*Capt. Galton.*) Do the Limerick people come to England by Waterford ?—They do ; but I have never travelled that way myself.

2354. It is the cheapest route, is it not ?—Something cheaper than the other, but the sea passage is longer.

2355. (*Mr. Ayrton.*) What is the class of the population who require additional railway accommodation ; are they private residents, or merchants, or retail traders chiefly ?—Merchants and traders.

2356. How many wholesale merchants are there in Limerick ?—I suppose about from 30 to 40.

2357. Do the retail traders in Limerick deal much directly with Dublin, or do they deal with the wholesale merchants in Limerick ?—They deal with the

* Witness subsequently explained that there was an error in the times given in the text. The morning train to Dublin started at 7.30 a.m., arriving at 3.35 p.m., and the return train to Limerick left Dublin at 7.45 p.m.

† Return tickets were available for next day.

wholesale merchants in Limerick, and a good many of them deal in Dublin also.

2358. Have you any resident population at present residing in Limerick of independent fortune, who may be termed idle persons?—Not resident in the city; there are some, but not very many.

2359. (*Capt. Galton.*) What is the population of Limerick?—Something under 50,000.

2360. (*Mr. Horsfall.*) Is there any great trade in cattle between Limerick and Dublin?—Yes.

2361. Are they sent by railway or by road?—By railway principally, I believe.

2362. What are the rates charged for cattle?—I do not know the rates for cattle.

2363. (*Mr. Ayrton.*) Do many travellers come to Limerick from the wholesale houses in Dublin with samples to take orders, or do they go out from Limerick to the surrounding districts?—A good many.

2364. By what class do they travel?—I am not very certain what class they travel by.

2365. (*Mr. Horsfall.*) Are the fares, in your opinion, considerably too high between Limerick and Dublin?—Yes. I have heard it generally complained of, that the fares are high, and that if they were reduced it would increase the trade and business of the city of Limerick, as well as give greater facilities for travelling, and many more persons would travel.

2366. It would increase the traffic both in passengers and goods?—Yes.

2367. (*Chairman.*) Have you any reason to suppose that the third-class passengers would increase in numbers by a reduction of the fares?—I think they would be very much increased.

2368. Do you ground that opinion upon any facts within your own knowledge?—Not particularly within my knowledge, but from having heard it spoken of.

2369. Is there any third-class passenger traffic between Dublin and Limerick, or is it chiefly from places in the neighbourhood of Limerick?—The larger proportion would be from Limerick. I believe that there is only one third-class train which leaves Limerick in a day, and that is very early in the morning—7.30 a.m.

2370. Do you think that, under any circumstances, any considerable third-class passenger traffic could arise between Dublin and Limerick?—I think it would.

2371. (*Mr. Ayrton.*) From what cause would it arise?—From a reduction in the rates.

2372. What third-class traffic would it be, persons going to pay visits in Dublin, or going there for occupation?—Persons going to Dublin for occupation.

2373. And when once they had gone they would remain in Dublin?—They may not.

2374. Do you mean that people would go there to be employed for a short time with the view of coming back?—Yes, tradespeople.

2375. Do the people in Limerick travel third-class when they go to Dublin?—I am alluding to tradesmen.

2376. Do you mean workmen?—Yes.

2377. Is there much movement of workmen between Limerick and Dublin?—Yes, at times. When there was a considerable amount of work in Dublin, and they required tradesmen, they would go from Limerick—labourers also—and come back again as soon as they found it convenient to come back to their families. I think there would be a good deal of third-class passenger traffic in that way created by a moderate rate of charge.

2378. What reduction in the rate would induce them to go up to Dublin in that way for employment for short periods of time?—I think about half of what it is now.

2379. (*Chairman.*) Is there any considerable influx of people into Limerick on market-days?—Yes, very great.

2380. How many market days have you in the week?—Two.

2381. From what distance do persons come into Limerick?—20 and 30 miles.

2382. Do a large number of them come by railway?—Yes, and for considerable distances too—20 miles—but for the short distances they consider it cheaper to come in on their own horses and carts.

2383. (*Capt. Galton.*) Do the railway companies run excursion trains on the market days?—No.

2384. They do not allow the third-class passengers to come in at a lower rate with a return ticket?—No.

2385. Do they issue no return tickets?—I do not think they do.

2386. (*Mr. Ayrton.*) Are there steamboats on the lower Shannon from Limerick?—Yes.

2387. Are they crowded with passengers?—They are not crowded with passengers, except in the summer season.

2388. Is that pleasure traffic or business traffic?—Both.

2389. Do you know the rates at which they carry passengers on the Shannon?—It is 2*s.* from Limerick to Kilrush; 3*s.* for first-class passengers.

2390. (*Chairman.*) Is there any large permanent population at Kilrush?—Yes, there is a large population.

2391. (*Mr. Hamilton.*) What is the distance from Limerick to Kilrush?—About 46 miles.

2392. (*Capt. Galton.*) Is there much traffic to Foynes?—No, there is not.

2393. (*Mr. Glyn.*) Did you say that they issued return tickets for the first-class passengers from Dublin?—I think they do.

2394. At what rate?—A fare and a half is the usual rate.

2395. (*Mr. Hamilton.*) I thought you said that that would only be good for the same day?—That is all.*

2396. Before that you could have gone to Dublin and have returned the same day?—Yes, but you cannot do that conveniently since the four o'clock train has been taken off.

2397. Then what is the good of a return ticket?—I suppose no one would take one now. I have not done so myself.

2398. Practically a return ticket is of no great value?—None whatever.

2399. (*Chairman.*) Have the fares been the same as they are now for many years?—They have been so.

2400. Has there been no alteration made, either in raising them or lowering them?—I think they have been advanced; three years since I think the fare was 21*s.*, I am not certain, and it was advanced to 23*s.* 8*d.*

2401. (*Mr. Hamilton.*) What is the ordinary line of communication between Limerick and England?—Through Dublin.

2402. Have you through rates by way of Dublin for passengers?—Yes.

2403. There is another line of communication by way of Waterford, is there not?—Yes.

2404. Can you book through by way of Waterford?—Yes, I believe so.

2405. (*Mr. Ayrton.*) Is it cheaper by way of Waterford than by Dublin?—Yes.

2406. Why do not persons go by Waterford?—The longer sea voyage prevents it.

2407. (*Chairman.*) Have they as good boats?—I have heard that they are excellent boats. I have not travelled in them.

2408. Pigs go over in those boats, do they not?—Yes, and cattle.

2409. (*Mr. Hamilton.*) You do not know whether you can book through from Limerick to Milford?—I do not, but I think I have seen it in one of their booking tables that you can do so.

* See note to question 2338.

Mr. J. R. Tinsly.

17th May 1865.

2410. (*Chairman.*) Are there any complaints in Limerick as to the charges upon the carriage for goods?—Yes.

2411. Will you be good enough to state the nature of those complaints?—Some time since the different railways into Limerick, the Great Southern and Western and the Waterford and Limerick, carried goods through from Liverpool to Limerick at a through rate of 15*s.* per ton.

2412. (*Mr. Dalglish.*) What class of goods do you refer to?—Heavy goods, iron, tallow, palm oil, sugar, and such heavy goods, and within the last two or three years they advanced the rates to 27*s.* and 30*s.* a ton, something equal to from 80 to 100 per cent., and we consider that that has done very considerable injury to the trade of our locality.

2413. (*Chairman.*) Are you able to state that the traffic of that description has fallen off since the raising of the charges?—It has.

2414. (*Mr. Ayrton.*) Are the sea risks included in the rates you have mentioned, or are they thrown upon the freighters; does the company bear the sea risk?—No, you have to insure.

2415. Are the goods carried over sea subject to the ordinary sea risks?—Yes.

2416. (*Lord Donoughmore.*) The Waterford and Limerick route to Liverpool is made up of the Waterford and Limerick line from Limerick to Waterford and the steamship company from Waterford to Liverpool?—Yes.

2417. The Great Southern and Western route is made up as far as the junction with the Waterford and Limerick and from the junction to Dublin of the Great Southern and Western, and from Dublin to Liverpool by the City of Dublin Steam Packet Company?—Yes.

2418. In order that there should be a uniform through charge by both routes, it is necessary to have an agreement between five companies, is it not?—Yes, the Cork Direct Company is now just as much interested as either of the others; it is another means of importing goods to Limerick and of exporting.

2419. Have you not some traffic by sea from Limerick to Liverpool direct?—Yes.

2420. What are the rates?—Twenty shillings; formerly it was only 12*s.* 6*d.*

2421. Who are the parties who are the owners of steamboats?—They are Limerick merchants.

2422. You stated, I think, that the railway companies charged 15*s.* a ton?—Yes, but now they charge 27*s.* When the railway companies were charging 15*s.* the Limerick Steamship Company charged but 12*s.* 6*d.* a ton.

2423. Is there not another route from Limerick to Liverpool by the river Shannon and the Midland line from Athlone to Dublin?—Yes, there is, but their rates are proportionately high.

2424. (*Capt. Galton.*) Is there not a route by Cork?—Yes, but they have advanced the charges; there is a combination amongst the companies to make those extra charges, and they have compelled or induced the Limerick Steamship Company to make the same high rates of charge proportionately with the longer sea voyage and the greater risk. They gave them an opportunity of charging from 20 to 30 per cent. lower than the railway charge. There are heavy town dues upon goods in Limerick coming by the long sea voyage, and also the uncertainty of so long a voyage from Limerick to Liverpool direct. They have given them the advantage of the difference between 20*s.* and 27*s.*

2425. What is charged by the River Shannon and the Midland route from Limerick to Liverpool?—I think it is 24*s.* 9*d.* to Limerick.

2426. That is cheaper than by the other route, by the Great Southern and Western?—Yes, it is 24*s.* 9*d.*

2427. (*Mr. Ayrton.*) Why is not the sea route used in preference, the charge being 20*s.* against 27*s.*?—Because it is a longer sea voyage, and there is also uncertainty as to the time of the sailing of the boats. They do not sail so regularly as they do from Cork and Dublin or from Waterford, and they have undertaken to pay heavy town dues, as much as 3*s.* 4*d.* a ton, in addition to the freight at Limerick, upon some of those articles.

2428. Referring to the articles which you have mentioned, do you suppose that that increased charge of 7*s.* a ton interferes with the consumption of goods in Limerick?—It interferes with the trade of Limerick, but whether it interferes much with the consumption of goods there I cannot say.

2429. Have you any reason to suppose that the consumption of those articles is diminished in Limerick by reason of the charge made for conveyance being increased to the extent you have stated?—I do not go the length of saying that.

2430. Sugar, for instance?—I cannot say.

2431. How then does it interfere with the trade?—It enables the merchants of Dublin and Waterford and of Cork to import goods at a freight I think of 10*s.* or 15*s.* into those places, and then they can send them within a very short distance of Limerick to some of the smaller towns, to the disadvantage of the Limerick import merchants.

2432. That is in competition one port with another in Ireland?—Yes.

2433. Is not that the necessary result of situation, the one being better situated than the other, and being nearer to the market or place of production, so that they can send the goods cheaper?—No, I do not think it is so in this case.

2434. Do you propose that the rates should be adjusted with a view to placing a more distant port on the same footing as a port nearer to the place of production?—The increase in the charge by the railway company to 27*s.* has been attended with this disadvantage as regards Limerick, that it has compelled our local companies or it has induced them to advance their rates to 20*s.*, whilst goods of the same class are imported into Dublin, Cork, and Waterford at 10*s.* or 15*s.*

2435. If the increase of the rate does not interfere with the consumption of the articles, the reduction would simply have the effect of making you a present of so much per ton to enable you to carry on your business in competition with the merchants of Waterford and Dublin?—We should have equal rates with them.

2436. But it would in effect be asking the railway companies to give you a sort of bounty or present to enable you to compete with the merchants of Waterford and Dublin?—Not to make it a present, the fact is the goods now do not come by the railways; in fact the rate is a prohibitory rate, for since they advanced it to 27*s.* the goods have scarcely come by the railways at all.

2437. I thought you stated that the grievance was that the goods were sent from Waterford a distance that brought them too near to Limerick, and that they ought to be sent from Limerick into the interior?—Yes, that is to places nearer to Limerick; a district that ought to be in connexion with Limerick is taken advantage of by a more distant city.

2438. The effect of a reduction would be to give you a bounty to that extent, and so enable you to send your goods further into the interior?—Not a bounty, but to give us the advantage of our local position.

2439. Are you not now suffering from the disadvantage of your local position by being further from Waterford or from Wales, where the iron is produced?—I think very little.

2440. What would be the difference in freight by sea from Cardiff to Waterford, as compared with from Cardiff to Limerick?—About 2*s.* a ton.

2441. (*Chairman.*) Is there any understanding between the Limerick Steam Ship Company and the railway companies as to the rates which they are to charge?—Yes.

2442. Have any of the railway companies an interest in the Limerick Steam Ship Company?—I believe one company has got some shares in it, one of

the managers; but there is an understanding between them, and a combination that none of them will take lower rates than those which I have named.

2443. Do all the steamboats trading to Liverpool belong to one company?—Yes.

2444. Has there ever been any proposal among the merchants of Limerick to set up steamers on their own account?—No, not in opposition.

2445. (*Capt. Galton.*) Who are the proprietors of the Limerick steam boats; are they Limerick people?—Yes.

2446. Are they merchants in Limerick?—Yes.

2447. Persons having an interest in the charges made for goods?—Yes.

2448. Does their interest as proprietors in the Steam Packet Company overweigh their interest as merchants?—Yes, and that makes them raise their rates.

2449. (*Chairman.*) Does the whole of the traffic from Liverpool now come by steamboats?—Yes, nearly all of it.

2450. (*Mr. Ayrton.*) Did they, in your opinion, make a large profit when they charged 12*s.* 6*d.* a ton?—No.

2451. Did they make any dividend at all?—Yes, they did.

2452. Why did they not continue to charge 12*s.* 6*d.* a ton?—Because I believe it was threatened that there would be an opposition if they did so.

2453. (*Mr. Hamilton.*) An opposition promoted by whom?—By the railway companies.

2454. (*Mr. Ayrton.*) You mean that there would be more steamers put on if they continued that charge?—Yes, very likely.

2455. (*Capt. Galton.*) Are you in business in Limerick?—Yes.

2456. In what trade?—I am an import merchant.

2457. Do you import any goods by means of the railways?—I have not done so for the last three or four years, or scarcely anything by the railways, but I did a great deal, almost all my business, by the railways until they advanced the rates; my goods are now carried by the direct steamers.

2458. (*Mr. Ayrton.*) Are the Commissioners to understand that the raising the rates from 12*s.* 6*d.* to 20*s.* has had the effect of preventing opposition by sea?—Yes.

2459. (*Mr. Horsfall.*) Opposition by the railway companies?—Yes.

2460. (*Mr. Ayrton.*) Is it open to anyone to offer opposition?—Yes.

2461. If 12*s.* 6*d.* is a profitable rate, how can you account for no one proposing to carry goods for that rate?—I do not know why persons do not do it.

2462. (*Mr. Hamilton.*) I understand you to mean this, that unless the steamboat company raised their rates to 20*s.* they would be run off the line, or would be met by active competition on the part of the railway companies?—Yes.

2463. (*Mr. Glyn.*) Can any of the railway companies establish steamboats?—Not as railway companies, but as individuals they could do it.

2464. (*Mr. Hamilton.*) In the interest of the railway companies?—Yes.

2465. (*Capt. Galton.*) What advantage has it been to the railway companies to raise the rates by the steamboats, seeing that by raising their own rates, as you say, they have driven all the traffic off their line of railway?—It takes the traffic direct to Limerick off their lines; but it gives them a great advantage as to the traffic coming within 20 miles of Limerick.

2466. (*Chairman.*) You mean the traffic from Dublin along the line?—Yes; the goods are imported into Dublin, into Waterford, and into Cork, and this has interfered with the direct trade to Limerick, while it has given the merchants of those places the advantage of supplying places all along the line.

2467. (*Capt. Galton.*) Has the result been to raise the price of goods in Limerick?—To that extent.

2468. Do you sell iron, for instance, in Limerick at a higher price?—Yes, to that extent.

2469. Is coal dearer in Limerick than it used to be?—It is rather dearer.

2470. What is the price of coal?—About 20*s.* a ton.

2471. How is coal brought to Limerick?—The greater part of the coal is brought by steamers.

2472. By steam colliers?—Yes, and trading vessels.

2473. Where is it brought from?—From Liverpool and Newcastle, and some is brought from London and from Glasgow.

2474. Do the vessels come laden with coal only?—No; they take in about half a cargo of coals and fill up the remainder with goods.

2475. Does any coal come from South Wales?—Very seldom.

2476. How does it come from South Wales?—It comes by sailing vessels from South Wales.

2477. And that coal costs 20*s.* a ton, delivered at Limerick?—Yes, there are steam coals as low as 16*s.* or 18*s.* a ton.

2478. Is much coal carried from Limerick into the interior of the country?—A great deal.

2479. The price is consequently enhanced beyond Limerick?—Yes.

2480. (*Mr. Ayrton.*) Is the trade in coal a close trade, so that the freights are regulated by any combination, or do the rates result from ordinary competition in the market?—I think the prices are regulated by ordinary competition in the market.

2481. (*Mr. Dalglish.*) What is the distance between Liverpool and Dublin, as compared with the distance between Liverpool and Limerick?—It is about one-half the distance, or less than half.

2482. Perhaps one-third?—Yes.

2483. Do you know what the freight is from Liverpool to Dublin?—From 10*s.* to 15*s.* a ton.

2484. Are there any town dues to be paid in Dublin?—I believe they have some small dues.

2485. The freight by steamboat is from 10*s.* to 15*s.* from Liverpool to Dublin?—Yes.

2486. But you do not know anything about the town dues?—They are very light. I believe there are dues, but very light ones.

2487. Nothing to compare with 3*s.* 4*d.*?—No.

2488. If you add 3*s.* 4*d.* to 20*s.* that gives you 1*l.* 3*s.* 4*d.*?—Yes.

2489. So that at Limerick you get goods carried from Liverpool to Limerick for about a third of the price that they would be carried from Liverpool to Dublin for; that is to say, the cost of goods to Limerick is 1*l.* 3*s.* 4*d.* per ton, including your town dues, whereas the cost of goods to Dublin is from 10*s.* to 15*s.* per ton—take 12*s.* 6*d.* as the average—and the town dues you say are very light; you get your goods from Liverpool to Limerick by steamer for 1*l.* 3*s.* 4*d.* per ton, the distance being nearly 500 miles, and the Dublin people pay 15*s.* per ton, the distance being only 120 miles?—Yes; the same rates apply both to Waterford and Cork as to Dublin, although the distances are greater.

2490. (*Mr. Horsfall.*) The insurance from Limerick to Liverpool is considerably more than from Liverpool to Dublin?—I suppose it is about 2*s.* 6*d.* per cent. more to Limerick than to Dublin.

2491. (*Chairman.*) When the charges upon goods were raised from 15*s.* to 27*s.* was it stated by the railway companies that the old fares were unremunerative?—I do not know that they made any public statement to that effect.

2492. (*Capt. Galton.*) Do you know what the charge is upon goods from Dublin to Limerick by railway?—It is 15*s.* a ton for the same class of goods.

2493. Is there any steam communication between Dublin and Limerick?—There is canal communication, and also by the upper Shannon.

2494. What is the freight by that course?—I think it is 12*s.* 6*d.*

2495. (*Lord Donoughmore.*) Is not the differential rate settled by the canal company in concert with the

Mr. J. R. Tinsly.

17th May 1865.

railway company ?—I presume it must be ; they will not carry for less.

2496. (*Capt. Galton.*) With regard to the cost of coal, can you explain of what the charge of 20*s.* per ton is made up, because we have been informed by other witnesses that the freight was 5*s.* a ton from Wales to Limerick ?—It is no such thing, at least that I am aware of. I think that 8*s.* is the freight by sailing vessels.

2497. From what place ?—From Wales or from Liverpool.

2498. What is the cost of the coal put on board ship ?—The Welsh coals are not generally used for housekeepers' purposes, and the price is about 18*s.* I spoke of housekeepers' coal when I said 20*s.*

2499. What is the freight from Newcastle ?—12*s.* 6*d.*

2500. What is it from Liverpool ?—8*s.*

2501. What is the price of the coal put on board ship in the river Mersey ?—I think from about 7*s.* 6*d.* to 8*s.* a ton.

2502. Are there any town dues to pay in Limerick for the coal ?—Yes.

2503. What is the rate paid for town dues ?—3*d.* per ton.

2504. (*Mr. Horsfall.*) The coal which you speak of as being put on board ship in the Mersey is called smiths' coal, is it not, at 7*s.* or 8*s.* per ton, and not household coals ?—I think that there are some household coals put on board at 7*s.* 6*d.* a ton, but there is a better class of coals than those ; some are as high as 9*s.* a ton.

2505. (*Lord Donoughmore.*) What would orrel coal be if put on board at Liverpool ?—I do not know ; but I believe there are two or three classes of orrel coals.

2506. When you state that the price of housekeepers' coal at Limerick is 20*s.* a ton, does that include the orrel coal ?—I think there would be some of that coal as high as 22*s.*, but I give you the average price at about 20*s.* ; the price of some goes as high as 22*s.*, and probably some runs to 24*s.*

2507. (*Mr. Ayrton.*) Is turf much consumed in the neighbourhood of Limerick ?—Yes, a good deal.

2508. How close to Limerick is it to be obtained ?—Within 6 miles.

2509. Is it much used in the city of Limerick ?—It is not so much used as it was, but turf is getting scarcer and dearer, for, in point of fact, the bogs are being worn out, and labour is not so cheap.

2510. Can you state the relative prices at which turf and coal come into competition with each other ?—When turf goes beyond 3*s.* 6*d.* a kish it is generally considered dear. All last winter it was as high as 5*s.* a kish.

2511. (*Capt. Galton.*) What is a kish ?—It contains a certain quantity of turf ; in fact, it is a horse-load.

2512. How many kishes go to a ton ?—It is not weighed ; a great deal depends upon the quality of the turf ; some bogs are very heavy and others are very light.

2513. (*Lord Donoughmore.*) When you say 3*s.* 6*d.* a kish, is that good Clare hand turf or common cut turf ?—Good turf, or hand turf.

2514. (*Mr. Ayrton.*) Do you mean to say that when turf is more than 3*s.* 6*d.* a kish it is cheaper to burn coal ?—It is generally supposed to be so, because coals are found to go more into consumption.

2515. (*Mr. Hamilton.*) Do you think there is likely to be an increase in the consumption of coal in Limerick and the neighbourhood ?—Yes, I think so.

2516. Owing to an increasing scarcity of turf ?—Yes, and also a scarcity of labour.

2517. (*Mr. Ayrton.*) When you say that it is cheaper to buy coal than to buy turf, you assume that the coal is 20*s.* a ton ?—Yes.

2518. And the turf at 3*s.* 6*d.* a kish ?—Yes.

2519. What is the price of turf per kish at the present time ?—About 4*s.*

2520. How far from Limerick will the price be reduced below 3*s.* 6*d.* by reason of economy in the cost of conveyance ?—Perhaps 10 or 15 miles.

2521. (*Lord Donoughmore.*) Does not a good deal of turf come from very low down the Shannon ?—Yes, a great deal of it comes from Kilrush and that district.

2522. (*Mr. Ayrton.*) Is any turf brought in by railways ?—Yes, from Castle Connel there used to be ; but the charge was so high that they were obliged to give it up.

2523. (*Chairman.*) Is any coal brought into Limerick by railway ?—There was, but there is not so much now.

2524. Where did it come from ?—From Waterford and also from Cork, but principally from Waterford.

2525. (*Mr. Hamilton.*) What is the present rate charged by the railway companies for coal ?—I cannot tell you, for I do not know, but somewhere about the same as the Limerick price now charged by the steamship company.

2526. What is the rate per ton per mile that is charged by the railway company on coal from Cork or Waterford ?—From Waterford to Tipperary they charge 4*s.* 9*d.* a ton.

2527. What would that be per mile ?—The distance is 55 miles to Tipperary.

2528. And the charge is how much ?—4*s.* 9*d.*

2529. (*Capt. Galton.*) Does the coal go from Limerick into the interior of the country now ?—Not much.

2530. Where does the coal that is supplied in the interior come from ?—It comes principally from Waterford and from Cork.

2531. At what price could you get coals delivered in Limerick through Waterford ?—I will give it you to Tipperary, that is within 22½ miles of Limerick and 55 miles from Waterford.

2532. At what price is the coal sold in Tipperary ?—I will give you the rate of charge first to Tipperary. The rate to Tipperary is 4*s.* 9*d.* per ton from Waterford. I believe the distance is 55 miles. Then from Limerick to Tipperary I find they charge 3*s.* 3*d.* a ton, and the distance is 22½ miles, and that is a very great disadvantage to Limerick in sending coals into the interior.

2533. Has the railway company ever been remonstrated with with respect to that disadvantage ?—Yes, I have remonstrated with them, and as to another article in which I deal largely, salt, they did advance the rate, and then they reduced it again.

2534. What is the rate at the present time ?—At the present time it is 4*s.* 9*d.* to Tipperary, and 3*s.* 3*d.* from Limerick to Tipperary ; that is, for a distance of 55 miles they charge, as I said, 4*s.* 9*d.*, and for 22½ miles they charge 3*s.* 3*d.*, which gives a great advantage to Waterford over Limerick.

2535. (*Mr. Hamilton.*) Do you include in the price of coal at the port of Waterford good domestic coal ?—No, I do not.

2536. You do not know what it could be put on a railway truck for at Waterford, coming by sea to Waterford ?—That depends upon the rate of freight to Waterford.

2537. (*Chairman.*) As far as the coal traffic is concerned, you think there is not much opening for the introduction of coal into Limerick by railways, and for the distribution of coal from Limerick ?—Yes.

2538. You do not anticipate under any circumstances it is likely that Limerick would be supplied with coal for its own consumption by railway ?—Not so long as we have direct steamers, because they must bring coals as ballast. As long as they trade and bring goods, they must carry a certain quantity of coals underneath the goods.

2539. (*Lord Donoughmore.*) And that you think would be almost sufficient for the local consumption ?—No, not if we had the same amount of trade that we had before the railway company reduced their charges.

2540. They increased them, did they not?—No, they have reduced them for certain distances within 20 miles of Limerick.

2541. But what I referred to was the consumption of coals in the city of Limerick, as distinguished from the consumption of coals in the surrounding district?—Then it would not be sufficient.

2542. (*Capt. Galton.*) Do you know at what price coal is sold at Tipperary?—No, I am not aware of that at the present moment.

2543. Are there facilities now at Limerick for putting the coals direct on to the railway trucks from the ships?—No, they have to be carted from the ships.

2544. For what distance are they carted?—From about half a mile to a mile.

2545. What is the cost per ton for carting the coal?—From 6*d.* to 1*s.*

2546. That charge has to be added to the cost of the railway freight?—Yes.

2547. (*Chairman.*) Besides the coal traffic, are there any other descriptions of goods traffic with respect to which you have complaints to make against the railway companies?—The only thing is that the general rate which they charge is 27*s.* per ton for those goods coming from Liverpool.

2548. I am referring to traffic confined to Ireland—internal traffic?—No, I am not aware of any other.

2549. (*Capt. Galton.*) You have mentioned salt?—Yes.

2550. Do you send salt into the interior from Limerick?—Yes.

2551. To what parts of the interior?—To Tipperary, Charleville, Roscrea, Ennis, Kilrush, Tarbet, and to very considerable distances round Limerick.

2552. (*Mr. Ayrton.*) Do you know of any commodity produced in the interior that would be brought to the port of Limerick in greater quantities than it is now if the railway charges were greatly reduced?—I think that turf would be brought in greater quantities.

2553. Can you mention any other commodity?—As it is principally an agricultural country I suppose corn would be, because it must find a market somewhere if it does not find a market in Limerick.

2554. The surplus corn, that remains after feeding the population in the interior, I presume, is brought to market?—Yes.

2555. Then there could be no great increase in that unless there was an increase in the products of agriculture?—No.

2556. Is there any particular reason why you think there would be any great increase in agriculture?—Not unless we had an increase in population, which I do not think we shall have. If we could get better prices for corn there would be an inducement to sow corn.

2557. Is there any other commodity that you think might be increased and sold in greater quantities in the interior if it were brought at a cheaper rate to Limerick?—Besides corn there is butter, and all other agricultural produce would be increased.

2558. Do you think that the production of butter in Ireland is retarded by the cost of carriage to Limerick and any distances round Limerick?—I do not think it is.

2559. Do you think that the rates charged are such as to keep down the growth of corn in the districts round Limerick?—I do not know.

2560. Do you think that turf might be dug at some distance from Limerick and be brought into Limerick in greater quantities if the rates were less?—Yes.

2561. What reduction do you think would be necessary to give a stimulus to the digging of turf?—I suppose that the rate should be considerably lower than it is now.

2562. What district do you think would be chiefly stimulated?—The county of Limerick; and from Ennis turf could be brought, also from the district of Castleconnell, by the Castleconnell railway.

2563. Do you know of any commodity that would be carried into the interior in any considerably greater quantities than at the present time, if there was a considerable reduction in the rates of conveyance?—I daresay coals would be carried to a distance considerably further than they are at the present time.

2564. In what direction would they be carried?—In the direction of Nenagh, for instance, and Roscrea.

2565. Bearing in mind what you stated, that by the present rates Dublin and Waterford send goods too near to Limerick, do you think if there was a still greater reduction in the rates from those ports goods would be sent from Limerick to Roscrea, or from Dublin to Roscrea?—That is a longer distance; Roscrea is a greater distance from Dublin than from Limerick.

2566. Having mentioned the different rates to the different ports, Dublin, for example, as compared with Limerick, would not the effect of a reduction of the rates be to bring the coals from Dublin to Roscrea, and not from Limerick to Roscrea?—If there was a uniform mileage rate by the railways I think the difference in the freight to Dublin would still leave to Limerick an advantage by railway.

2567. Is there no turf in the neighbourhood of Roscrea?—A good deal of coal goes there.

2568. But are there no peat bogs in that neighbourhood?—Yes, there are some.

2569. Are they worked?—Yes, they are; but it is principally to Nenagh, and between Nenagh and Roscrea, that the coals go from Limerick.

2570. Is it high ground thereabouts, and free from bog, between Nenagh and Roscrea?—There is a good deal of bog there, there must be, but a certain quantity of house coals are carried there notwithstanding.

2571. Is that consumption of house coals, in your opinion, likely much to increase, or is it an article of luxury at the present time with which turf comes into competition?—The turf would come into competition with it when the price was moderate.

2572. (*Capt. Galton.*) Is there any cattle trade from Limerick?—Yes.

2573. A large cattle trade?—Yes.

2574. Do the cattle come by railway to Limerick, or do they walk into Limerick?—I am not conversant with the cattle trade, but I have heard them say that they preferred driving the cattle to paying the high charges.

2575. If the charges were lower do you think that the traffic would increase on the railways?—I think so.

2576. Is there any mineral produce anywhere near Limerick?—Very little.

2577. Are there any mines near Nenagh?—Not sending minerals into Limerick.

2578. Are there any mines of any sort?—Yes, but not sending into Limerick for shipping at present.

2579. (*Chairman.*) Is there any flax manufactured in Limerick?—Yes.

2580. In Limerick itself?—Yes.

2581. Is the produce of those manufactories increasing?—I do not think it is.

2582. Is any quantity of flax brought into Limerick by the railways?—Very little, I should say, by railway.

2583. (*Mr. Ayrton.*) Is there any great water power on the falls of the Shannon?—Yes.

2584. Is that utilized for any purpose of industry?—Very little.

2585. (*Chairman.*) Are those flax manufactories which you have mentioned worked by water or steam power?—They are worked by steam power.

2586. (*Mr. Ayrton.*) Is the water power on the Shannon so constant that it could be utilized without steam machinery in addition?—Yes, a great deal of it is constant; it is principally used for corn mills and flour mills.

2587. (*Chairman.*) Are there any suggestions that you wish to make to the Commission as to any improvements that could be introduced with respect to

Mr. J. R. Tinsly.

17th May 1865.

the traffic on the Irish railways?—The only suggestion that I would make is, that I think if the different lines of railway were under one uniform management it would be a very great advantage.

2588. (*Mr. Glyn.*) Do you mean under one board?—Yes.

2589. To have all the Irish railways under one board?—Yes. I think it would be an advantage to have a Government board.

2590. On what grounds should you prefer a Government board?—I think that each locality would then have the advantage of having a board that would be independent of anything like local interest.

2591. (*Mr. Ayrton.*) Have you found any difficulty in booking through in Ireland, or is there any complaint in Limerick of any difficulty in booking goods through to the different ports of Ireland?—No, I am not aware that there is any difficulty in doing so.

2592. (*Chairman.*) Have you any trade with the north of Ireland?—Scarcely any.

2593. You are not in favour, I think, of competition as respects the railways?—I would be in favour of competition, but not of combination.

2594. Do you wish that all the railways should be amalgamated?—Yes, under a Government board, or such an independent board as would make equitable uniform rates, according to the mileage.

2595. Has it ever been in contemplation to take the railways at Limerick down to the wharves on the banks of the river?—It has been spoken of.

2596. At Waterford, I believe, the railway is in communication with the water?—At one side, I believe, it is close to it.

2597. (*Capt. Galton.*) With regard to the trains which run from Limerick to the junction line, do many of the trains correspond with the South Western down trains at the junction?—Yes, I believe they all correspond, with the exception of the mail train; it leaves at 11 o'clock, and it has to wait two hours.

2598. The only train that does not correspond is the mail train?—Yes.

2599. All the other trains do meet?—Yes, I believe so.

2600. (*Mr. Gower.*) You would then propose that a Government board should be constituted; by whom should the members of it be elected?—I suppose the Government would devise means for doing that.

2601. You would propose that the Government should name the board?—Yes.

2602. Would you have that board consider the interests of the railway companies or the interests of the public?—Of the public. I think that they should consider the interests of both to a certain extent; but I think that the interest of the public should be first consulted, both as to the number of trains required and the rates of charge.

2603. (*Lord Donoughmore.*) Supposing that the adoption of those alterations in the interests of the public were to result in a very serious diminution of the dividends to the shareholders, what should be done then?—I think that the rights of the shareholders should be preserved in any case.

2604. What do you conceive the rights of the shareholders to be; is it not to make as much money as they can out of the railway?—Yes, in proportion to what they are now making. I do not think that they are making a very large dividend just now. I daresay that the Government would deal with the shareholders in an equitable manner; but I cannot suggest the means of doing it.

2605. (*Mr. Ayrton.*) You think that the Government should buy up the railways and take them into their own hands?—To take the management as they may think proper to do.

2606. They could hardly undertake to manage any other person's property without their consent?—No, but to take it at a valuation.

2607. (*Capt. Galton.*) Having done that they would have to pay a certain sum to the shareholders to buy them out, and that sum must be borrowed or obtained in some way and interest must be paid upon it?—Yes.

2608. Supposing that the working of a line resulted in a loss to some extent of its interest, how would you propose to meet that loss?—That is assuming a case that may not occur.

2609. You ought to provide against all contingencies in those arrangements, and suppose that a loss did occur, how would you meet the loss; ought there to be a general taxation in England, or ought it to be by local taxation in Ireland?—I should say that it should be a taxation in Great Britain, an imperial taxation.

2610. You would not have the railways managed on the principle that the expenses connected with them should be paid by the persons who used them?—I think that the expenses would be paid with proper management under a Government arrangement.

2611. Would you have them managed upon the principle that the expense of the railways should be defrayed by those who used them?—I think that that is a most equitable way.

2612. You would consider, I suppose, that part of the expense of a railway was the cost of making it?—Yes.

2613. Therefore you would propose that the Government board should so regulate the rates that they should return an interest upon the cost of making as well as upon the working charges?—Certainly. I do not wish it to be inferred that the present shareholders should be injured by the Government taking possession. I rather think that their rights should be preserved, but I think the public ought to have more convenience and lower charges.

2614. (*Mr. Glyn.*) Suppose the lower charges did not realize quite so much money as before, what would you do then for the shareholders?—That is a question that I can scarcely answer.

2615. (*Mr. Ayrton.*) Of course they must make such arrangements as would make it pay?—Yes.

2616. You would raise the rates again?—Yes, raise them moderately, without raising them so much, that it would leave a profit to the Government.

2617. At the present time you say there is scarcely any profit realized for the shareholders?—On some of the lines there is not.

2618. (*Mr. Hamilton.*) The Great Southern and Western line has paid a dividend as high as five per cent. for many years?—Yes; but the Waterford and Limerick line is not paying so well, nor the Ennis and Limerick. The Foynes and Limerick line is a very bad one.

2619. The fares on the Foynes and Limerick line are very low, are they not?—They are low.

2620. Lower than any other line in Ireland nearly?—I cannot exactly say; I have not travelled by that line.

2621. (*Mr. M'Clean.*) If the Government purchased the railways in Ireland, how would you provide for further extensions?—I daresay by an advance of Government money.

2622. (*Mr. Hamilton.*) Is it your opinion that if the fares were moderately reduced the traffic would sufficiently increase to enable the Government to meet all the charges, pay a reasonable dividend to the shareholders, besides paying the working expenses?—That is my opinion.

2623. (*Mr. Dalglish.*) Do you not fancy that local government in a district would be better for the management of the railways than general management by the Government?—I do not quite understand the question.

2624. Would they not be more conversant with the interests of the place?—Government management would in my opinion be quite as good as any local directory.

2625. For instance, take all the railways south of that blue line on the map between Dublin and Galway and place them under local management, would not the persons having the management in that district

understand the wants of the district better than mere Government servants sent from England ?—It does not follow, I think, that Government servants would be sent. Irishmen might be appointed.

2626. But the servants, whoever they were, must be under the control of the Government ?—Yes.

2627. Would not persons belonging to the district understand the wants of the district better than any Government officer ?—I do not think they would. I think that Government officials could be made as well acquainted with them as any local directorate. If I understand your question, it is whether a local directory would not manage and understand the requirements of the locality better than Government officials ?

2628. Yes.—I do not know that they would.

2629. Supposing that a fair bargain was made with the railway proprietors of all the lines south of the blue line between Dublin and Galway, and that the whole management was placed under a board nominated in that part of Ireland by persons interested in railways, would not that be the best plan ?—What power would the Government have over that board ?

2630. They would have nothing to do with it. My question is, would not a board so appointed be better than a mere Government board ?—I think that a Government board would do it quite as well and in some cases better, for they would have no local influence brought to bear upon them to induce them to make extreme charges at one place and lower charges at another.

2631. Why should the servants of a district have any local influence exercised over them ?—It is natural, I think, that they would have.

2632. Why should they not be equally honest with Government officials ?—You are talking of Government officials and not of directors.

2633. I am talking of the persons who are to manage a great amalgamation of railways. Suppose a board to be appointed by the people living south of that blue line to represent the interests of that district ?—Then there must be shareholders who have an interest in the railways to appoint them.

2634. That does not follow.—If I understand you the Government are to appoint persons connected with the locality.

2635. No ; the Government are to have nothing to do with the locality, they are to appoint their own people ; and supposing an arrangement of that kind made, I wish to ascertain what your views are, whether the amalgamated railways would be better managed by a board appointed by persons living in the district, or by officials appointed by the Government ?—I do not see what power the people living in a district would have to appoint a board unless they were shareholders and they had some interest in the matter.

2636. But I am supposing the board to be appointed.—Then I must say that I should prefer a board of Government officials, because I think they would be more responsible.

2637. Would it not be more fair to the country generally, if the railway system in Ireland is to be put under one control, to put it under the control of the people of the district, who might be assessed for any falling off in the receipts that might be realized by the working of the system ?—How could you do that without taking the ownership out of the shareholders' hands ?

2638. You must do that if the Government is to work the lines. You say that an amalgamation of all the railways under the Government would be an immense advantage to Ireland ?—Yes.

Mr. J. R. Tinsly.

17th May 1865

2639. I want to ascertain from you whether, if it became necessary to make some arrangement for the benefit of the district through which the railways to which I have called your attention run, and a board was appointed by the inhabitants of that district to manage those railways, whether they would not be better managed by a board so appointed than by Government officials ?—Taking the question as I now understand it I do not think it would be so. I think the system could be quite as well managed by Government officials. I do not see why they should not be selected from persons in the locality as well as coming from a distance.

2640. Supposing that to be done and the system was managed for the benefit of the people, do you imagine that the locality would be content to be assessed for any loss that might arise ?—I do not think it would. I think that if once the Government took the management of the railways into their hands they would be responsible for any loss, if there should be any.

2641. Although under their management, with the proviso that the railways should be managed entirely for the benefit of the people in the district ?—The management, of course, would be for the benefit of the people.

2642. Do you not think that it would be very likely to lead to this, if the Government assumed any such power over the railways in a particular district, that whenever an election came on the people in the district would say, " You did not do what we wanted " you to do, and unless you do that we will have you " out ?"—I do not know that it would have any effect upon the election at all. I do not see any effect that it could have.

2643. You do not think that it would be made a handle of ?—I do not think it would.

2644. (*Chairman.*) You do not think that the people of Limerick would be willing to be assessed in order to make up any temporary deficiency that might arise by a general lowering of the rates on the railways running into the town ?—No, they would not.

2645. Would they rather go on with their present rates than incur the liability of having to make up any deficiency ?—Certainly.

2646. (*Lord Donoughmore.*) What do you think the country gentlemen would say of having a tax put upon them to compensate for any deficiency arising from lowering the rates ?—I do not think that any portion of the inhabitants would like it, but I do not assume that such would be the effect of a reduction in the rates ; I assume the contrary.

2647. (*Chairman.*) You think they would not like to run the risk of it ?—Yes.

2648. And that they would rather go on with the present scale of charges than run any risk of that kind ?—I think so.

2649. (*Mr. Ayrton.*) Would the effect of taxing a district be to tax the whole incomes of the country gentlemen, and to reduce the charges upon the merchant in conducting his business with a view to his ultimate profit ?—Yes, and I think it would be very unfair.

2650. (*Mr. Dalglish.*) Would it not be unfair to tax the whole of the kingdom to benefit the railways in Ireland ?—I take it that it would not be if it was an imperial tax.

The witness withdrew.

Mr. Michael Robert Ryan examined.

Mr. M. R. Ryan.

2651. (*Chairman.*) You are a merchant of Limerick ?—Yes.

2652. Are you a member of the Chamber of Commerce in that city ?—Yes.

2653. Have you had occasion to form any decided opinion as to the effect of the present rates charged upon the railways coming to Limerick ?—Yes, I have.

2654. Are you able to speak both with respect to the passenger fares and the rates charged upon goods ?—Yes, but of the passenger fares principally.

2655. Will you be good enough to state what opinion you have formed as to the effect of the present passenger rates ?—I think that they have prevented a great deal of traffic which would otherwise have taken

Mr. M. R. Ryan.
17th May 1865.

place; the people are very poor and they have not got much money to pay for railway transit, and I think that if third-class trains were placed more within the reach and circumstances of the people they would be more available; but there is another matter which I think operates upon the traffic as much as the high prices, the want of a better arrangement as to keeping time between our principal lines of railway and the tributary ones. We have six lines of railway coming into Limerick, and by some extraordinary arrangement they do not at all keep time for the third-class passengers.

2656. Do you mean that that they do not keep the time as published in their time tables?—No; they keep that time, but they do not hit off the trains which arrive; that is to say they do not correspond. There is only one third-class train in the course of a day out of Limerick to Dublin; it leaves at half-past seven in the morning, and there are no other means or opportunity for third-class passengers to travel until the following morning; and all the country trains, those five or six trains of which I have spoken, arrive in Limerick after the departure of that train, and the passengers have consequently to remain at Limerick all that time and during the night in order to get off the following morning. If I may be allowed I will quote from a few memoranda which I have put down in writing upon this subject. What I am about to state will show the inconvenience and delay to the public, the result of the present railway system, particularly arising from small local companies. There are in connexion with the city of Limerick no less than six railway companies, namely, the Great Southern and Western, the Waterford and Limerick, the Cork and Limerick direct, Limerick and Foynes, Limerick and Ennis, and the Limerick, Castleconnell, and Killaloe. The passenger traffic between Limerick and Dublin is carried on by the Waterford and Limerick and the Great Southern and Western viâ the Limerick junction, also by the Limerick, Castleconnell, and Killaloe, and Great Southern and Western viâ Nenagh, and Roscrea and Parsonstown Junction viâ Limerick junction. There is only one third-class passenger train from Limerick to Dublin by this route. This train leaves Limerick at 7.30 a.m., and arrives at the Limerick junction at 8.35 a.m. Passengers, &c. are here detained until 10.44, over two hours, and then proceed by the train on the Great Southern and Western line by the train which left Cork at 8.0 a.m. This train arrives in Dublin at 3.35, whereby passengers, &c. going from Limerick to Dublin, a distance of 129 miles, are detained over eight hours on the road. This journey in the old coach times was performed in 12 hours. The next train for Dublin by this route is a mail train which carries the principal English mails, leaving Limerick at 11.0 a.m., and arriving at the Limerick Junction at 12.0 at noon; passengers and mails are here detained until 1.57 p.m., nearly two hours. This train arrives in Dublin at 5.35. If this train did not start from Limerick until 12.40 p.m. it would give the citizens of Limerick 1 hour and 40 minutes additional time to answer English letters received in the morning, and would also be a great convenience to passengers. There is no train from Limerick to Dublin on Sundays except the mail train at 10.45 p.m. In fact there is no train into or out of Limerick on Sundays except the night mail train, and an excursion train to Cork and Killaloe viâ Nenagh and Roscrea. There is no third-class train by this route. The first train by this route leaves Limerick at 10.15 a.m., and arrives in Nenagh at 11.30. Passengers, are detained in Nenagh until 2.0 p.m., two hours and a half, and arrive in Dublin at 5.35 p.m. 7 hours and 20 minutes on the road; whereas if this line was in the hands of one company, or the Government, the journey could be easily performed under five hours. The second train by this route leaves Limerick at 2.0 p.m., and arrives in Nenagh at 3.15 p.m.; again passengers are delayed until 5.15 p.m., two hours, and arrive in Dublin at 9.30., seven hours and a half on the road. This line of railway is about five miles shorter than the one viâ Limerick junction, the distance by this route being 124, by Limerick junction 129. This route from Limerick to Dublin clearly exemplifies the evil of allowing railways to remain in the hands of rival and short companies. This railway is held by lease from the Limerick, Castleconnell, and Killaloe to the Limerick and Waterford Company as far as Birdhill, 14 miles, and of course the Waterford and Limerick Company throw every impediment in the way of passengers, &c., proceeding by this line, in order that they should go by the Limerick Junction on their own line. The Great Southern and Western own this line from Dublin to Birdhill, 110 miles, the Limerick, Castleconnell, and Killaloe from Birdhill to Limerick, 14 miles. Passengers can leave Nenagh, an unimportant town and only a few miles from Limerick, at 6.40 a.m., arrive in Dublin at 11.0 a.m., leave Dublin at 4.0. p.m., and arrive at their homes at 8.30 p.m. This line being in the hands of one company the public at Nenagh have the advantage of leaving their homes in the morning, have five hours to transact their business in Dublin, and can return same evening to their homes; and if the entire of this line was in the hands of one company or the Government the Limerick public would have the same advantage as Nenagh. The first train from Limerick arrives in Dublin at 3.35 p.m.; the last that leaves Dublin for Limerick is at 1.0 p.m. From the present railway system, so far as Limerick is concerned, the several companies connected with Limerick seem to throw every obstacle in the way of the public and put them to every possible inconvenience, and it is no great wonder their receipts should be so low. The Waterford and Limerick Company paid no dividend for many years; the last was about one per cent. The Limerick and Foynes, Limerick and Ennis, and the Limerick, Castleconnell, and Killaloe have paid no dividend since opened. The Government should by all means purchase up all railways, but more particularly small and non-paying ones, as they are great obstacles to large and extensive undertakings by running their trains at such times as are most inconvenient to them.

2657. The detention at the Limerick junction has been only a very recent occurrence?—Yes.

2658. Within the last two or three months?—Yes.

2659. Has the traffic between Limerick and Dublin diminished in consequence of that delay?—I should certainly think so, because persons who would otherwise go to Dublin more frequently do not wish to remain for a space of two hours in one of the most unpleasant places imaginable—the Limerick junction.

2660. Is there a considerable class of persons in Limerick who would be likely to travel to Dublin if they could return on the same day?—A very great number.

2661. Both first, second, and third class passengers?—Certainly.

2662. Do you think there would be a large third-class traffic between Limerick and Dublin?—Yes, not of the labouring class, but certainly of the shop-keeping class or the trading class. They obtain their supplies both from Dublin and from Cork, and they cannot travel to either of those places third-class and return on the same day.

2663. Not from Limerick to Cork and back on the same day?—I think not. I know that to Dublin they cannot do so. We had very great hopes when the Great Southern and Western Company were permitted to extend their line from Roscrea to Limerick, and they promised at that time to give us great facilities, to have a continuation of their line to Dublin, and that would have given us the same facility which they formerly gave us when a train started at 6 o'clock from Limerick, leaving Dublin at 4 o'clock again, so that the Limerick people had time to transact their business in Dublin and return to Limerick.

2664. To what do you attribute the discontinuance of that train?—I cannot officially say, but the im-

pression made was lest it might create a contest in opposition from the Waterford Company, who were, of course, anxious to carry goods through their own junction and 20 miles of their line ; but the new line is perfectly useless because there is no third-class train from Limerick to Dublin viâ Nenagh.

2665. It was not discontinued, was it, in consequence of not paying ?—I think not ; the experiment has not been tried.

2666. You stated that at one time there was an early train from Limerick to Dublin by which you could go and return to Limerick on the same day ?—Yes, by the junction before the opening of the Nenagh line, and which was a very great convenience.

2667. (*Capt. Galton.*) Was that a third-class train ?—Yes.

2668. It came back from Dublin at 4 o'clock ?—Yes.

2669. Did they issue return tickets for third-class passengers ?—No, they charged full fares for them.

2670. (*Mr. Ayrton.*) What class of persons travelled by that train ?—The persons, I think, were cattle dealers, and even poor shopkeepers—country shopkeepers—persons not in very good circumstances, who went to Dublin and selected their articles and then came back again. By the present arrangements a shopkeeper in Ennis, which is the capital of the county of Clare, and a very important town, as a third-class passenger, requires, in order to give him one day in Dublin to transact his business, four days to accomplish his journey.

2671. (*Capt. Galton.*) How do you make that out ?—In this way; a third-class passenger must leave Ennis at 3 o'clock in the afternoon, that is, by the third-class train from Ennis, and remain in Limerick, which is distant only 25 miles, all night, and then proceed by the morning train to Dublin, which arrives at 3.35.

2672. At what time does the morning train leave ?—At half-past 7; there is no train from Clare.

2673. That train does not correspond at the junction with another train ?—No ; and it waits at the Limerick junction for the train from Cork, which leaves Cork at 8 o'clock. The passenger must come the night before to Limerick, there being no train from Clare, and the passenger is 24 hours on the road, the distance being 154 miles by this arrangement. It takes the same time to return, as to go from Ennis to Dublin, and transact one's business. In the old coach times the journey would have been accomplished in the same time.

2674. This of course very much limits the third-class traffic between the district you have referred to and Dublin ?—It entirely precludes it.

2675. (*Mr. Ayrton.*) Is there no afternoon train from Limerick to Ennis?—Yes, but it goes at a most inconvenient hour. It leaves before the arrival of the other local trains.

2676. It leaves before the arrival of the Dublin train?—Yes ; and a person coming from Cork to Limerick, and wishing to go to Ennis third-class, cannot get off at night.

2677. (*Capt. Galton.*) It is cheaper for them to travel second-class than to stay a night in Limerick ?—I fancy it is ; but that class of people will not travel second class. You cannot make them understand it, when there is not a third-class train going from their homes they remain until there is one.

2678. Every impediment seems to be thrown in the way of third-class travellers ?—I think so.

2679. (*Chairman.*) Do you attribute that fact mainly to the number of the small railway companies, and the conflicting interests which exist?—Yes. Each of the six lines to which I have referred is very short, and they have local directories, and they certainly do not hit off well. They appear not to understand each other; and I have not the slightest doubt that if all those lines of railway were under one central management, the times of the trains could be so adapted to the convenience of the public that it would induce a large amount of additional traffic.

2680. (*Mr. Glyn.*) Has the Great Southern and Western Company ever tried to buy up the small railways ?—I believe that they sought to buy up the Limerick and Castleconnel line, or to lease it.

2681. Have they power under their existing Acts to do so ?—I think not.

2682. Nor any power with regard to the other lines ?—I think not. I think they came to Parliament last session to buy up the Limerick and Castleconnell line from Nenagh to Birdhill, but they lost their bill, and the Waterford Company got an Act, and the Limerick and Waterford Company has the haulage of all those lines. It is an impression certainly of my own that it is from hostility on the part of the Limerick and Waterford Company and the Great Southern and Western Company that there is any impediment placed in the way of the traffic. It seems very odd that the direct route from Dublin viâ Nenagh should be perfectly useless, and that there should be no through traffic carried on, and no third-class train upon it, running uninterruptedly to Dublin, for it was made expressly upon those conditions.

2683. Is there no obligation upon the company under their Act of Parliament to put on a third-class train ?—I cannot say ; they run a third-class train to Nenagh.

2684. (*Mr. Ayrton.*) You think that all this inconvenience arises from the Waterford and Limerick Company trying to force traffic over the line from Limerick to Tipperary, rather than let it go over the line from Limerick to Nenagh ?—I do ; that is the legitimate channel for it, that is the straight line.

2685. (*Chairman.*) Do you wish to state any facts as to passenger fares on any other lines besides those between Limerick and Dublin ?—I can state in general terms that the railways about Limerick are not doing the work of the country ; carriers are still numerous on all the roads where railways are. I must state that we have not much experience on the subject, it has not been tested. The public think, from what the traffic managers tell them, that things are as low as they can go to pay, and those who are inexperienced in railways take that as the state of circumstances, and they have not pressed the matter; but my own impression is that when one sees the traffic of our own country all going by road by a route running parallel with railways, that the cattle are driven long distances, having been bought in the west of Limerick and Clare, and going up through Dublin on to Meath, where they are fattened—it strikes me that that being our principal traffic, as we have not got any manufactories, the attention of railway directors ought to be called to the matter to see how they could manage to get that traffic on to their lines ; they say that it will not pay them to carry them under a certain rate, but the railway waggons go empty, and there is no prospect of filling them, when, if they even tried the experiment of taking them at a very considerable reduction, such a reduction as would pay the breeder of the cattle to rear them, I think that it would pay the railway companies something. There is no buyer who will drive cattle long distances without knowing that it deteriorates them very much, and brings them into bad condition, and who would not be willing to pay a moderate price for their carriage.

2686. Have you calculated the matter, and quite satisfied yourself that cattle would be carried profitably by the railway companies ?—No, I have not ; but there is a gentleman coming from my district, Mr. Cooper, of Cooperhill, who is extensively engaged in the cattle trade, and farms a large quantity of land, who is prepared, as I have understood from him, to give evidence on the subject, and he is certainly a very high authority, being a very large buyer of cattle.

2687. (*Mr. Glyn.*) Do the few passenger trains

Mr. M. R. Ryan.

17th May 1865.

which are run now, go tolerably full?—Indeed they do not, most of our trains are very empty indeed.

2688. Even without adding to their present expenses, with lower fares you think the traffic might be increased?—Decidedly; our smallest trains could carry many more passengers.

2689. (*Mr. Hamilton.*) If the fares were considerably reduced, do you think there would be a very large increase in the number of the third-class passengers?—I should anticipate such a result.

2690. (*Mr. Ayrton.*) From what do you think that increase would arise?—I think, with regard to the labouring classes, we have not many of those who would travel by a railway train, unless placed within the reach of their limited resources, but the small farmers and men going to market with their butter, corn, and other farm produce, would do so, who now drive their cars along the road carrying their butter to sell in the markets, and there are other persons who would go with their produce into a town and sell it, leaving their horse and car at home.

2691. (*Mr. Hamilton.*) Is it not the fact that the present high fares have compelled many persons to walk who would otherwise travel by the railway train?—There is no doubt of it, and in my own district. I am a shareholder in the Limerick and Foynes Railway; it has never paid one shilling dividend, and I do not expect that it ever will. The line runs parallel to the road leading to Askeaton and all that district; but the people never think of going by the railway, although the distance is very little more, if anything, than by the main road; the railway and the road are nearly parallel lines.

2692. (*Capt. Galton.*) I believe the fares are very low on that railway?—They have advanced them recently, but this is an instance of the effect—in April 1863 a considerable increase was made in the passenger charges of 10 or 12 per cent.; in the year previous to the change the number of passengers was 87,000, and in the year after the change the numbers fell to 63,000, showing a falling off of 24,000. So likewise there was a similar falling off in the traffic of the "Kelpy" steamer, working in connexion with the Foynes line, in which there was a similar raising of the fares, the falling off of passengers being from 15,000, making a receipt of 17,000*l.*, to 8,300, bringing 9,060*l.* That was the effect of increasing the rate.

2693. You reason from that, that if they lowered the rate they would get a still larger number of passengers?—Yes.

2694. Do many of the farmers of the agricultural community generally travel by railway within distances of 10 miles from Limerick to come to market?—No, they never think of doing so.

2695. Do they travel by railway within 15 miles of Limerick?—They very rarely do, I think, beyond the limit of 15 miles from Limerick; they do up to 15, but otherwise they employ their own horses and cars.

2696. If the fares were reduced would more persons travel by railway?—Yes; for I am certain that no farmer would take his horse and car into a town if he could avoid it, for he has to put his horse up at livery at very considerable cost, and, besides that, it takes his horse from the farm where it might be usefully employed.

2697. Are there no special passenger fares for market days?—Sometimes there are, but very rarely.

2698. Not as a regular rule?—No. One of the principal market towns on the Foynes railway is Rathkeale, which is a town of considerable importance; there are several fairs held there in a year, and the arrangement of the trains is such that a man can only get by any train half an hour to transact his business in the town, and then come back again.

2699. (*Mr. Ayrton.*) Do you know the precise nature of the passenger traffic in which the falling off took place?—Yes; it was in the general traffic from Clare. Persons pass over from Kilrush to the other side of the Shannon by a fast steamer and come to Foynes. Limerick was the supplying city for all the small towns in Clare, and there is also a fashionable watering place called Kilkee on the coast of Clare.

2700. Was the falling off in the pleasure traffic or in the business traffic?—I cannot say, but I should say both. I know that there were a great number of persons who had their families down there, and who took lodgings in Kilkee to have the advantage of the cheap fares up and down the river; but when they found that the fares were advanced they went away to other watering places.

2701. That prevented a great number of persons from going backwards and forwards to that watering place?—Yes.

2702. Do you think that the falling off was chiefly in that class of persons, or in persons going to Limerick for business purposes?—I rather think it was in the former.

2703. (*Mr. Gower.*) I understand you to say that the shareholders have grounds for complaining of the management of their railways, and that if the rates were altered, and the trains differently arranged, they would receive larger profits than they do now?—That is really the feeling of the shareholders.

2704. Do they never remonstrate with the directors?—I have done so myself, and I have more than once heard other shareholders remonstrate with the directors at the half-yearly meetings; but our directors do not appear much to mind that. I was one of the promoters of the Foynes line at the original starting of it, and that was a line that was said to be required.

2705. In England, when shareholders are dissatisfied with their directors, they elect others. Has any attempt of that kind been made in Ireland?—The fact is that all our local lines have got into the hands of one party; a few persons who hold the shares and the few small shareholders who hold but a limited number of shares are powerless; the larger number of the shares are represented by one or two large holders of them, and they control the voting.

2706. But the interest of those shareholders is the same as that of the small shareholders?—Yes, it should be.

2707. (*Mr. Glyn.*) Are they satisfied with the present system of management?—They differ from me in opinion, and they do not reside locally. Our shares are principally held by one individual who does not live in Limerick and has no connexion with the place. I allude to Mr. Malcolmson.

2708. (*Mr. Ayrton.*) He has the greatest interest, has he not, in seeing that the railway is well managed?—Certainly.

2709. (*Mr. Gower.*) As to the third-class train from Limerick to Dublin, is it your opinion that if a later train was put on it would not be a loss to the company?—I think it would not; I think it would be a profit to them, as it would convey the passengers who arrive by the several local trains during the day. I think that there would be more persons travelling by it, and that it should be entirely a matter of discretion with the traffic manager, to put on a train that would catch the public traffic.

2710. Have you considered the effect it would have upon other trains by which there were no third-class fares, I mean second-class trains, in diminishing the number of the travellers?—I have not considered that very thoughtfully, but it strikes me that the class of persons who would go by a third-class train would not go by a second-class train; they abstain from going, and they probably make an arrangement with a neighbour from one particular village to go up and transact the business of three or four. I rather think that those persons would go up and do their business if the opportunity was placed within their reach.

2711. (*Capt. Galton.*) It has been stated by a witness that instead of people going to market towns themselves to sell their goods, or to buy fresh articles of consumption, it was the custom for hucksters to go through the country buying up the produce, and also selling small wares; is it the same in your part of Ireland?—Yes, it is.

2712. Do you think that that state of things would be altered if lower fares were charged?—I think so. I think that that is the impression on their minds, that the fares are high, and that they would not cover their expenses in addition to the price that they get at home, and that keeps them at home.

2713. Are eggs and butter sold in that way?—Yes.

2714. Would the produce of those persons who now sell them to hucksters be sufficient to make it worth their while to go to market and try to sell it if the fares were lower than they are? — Yes, I think so. On the line, about the Tipperary district, which is in the hands and management of the Limerick and Waterford Company, they encourage as much traffic as they can between Tipperary and the towns near Tipperary and Waterford. Persons going with their firkin, or perhaps two casks of butter, they give them a free pass to accompany it there, and the result is that a good deal of butter goes in that direction, and at moderate charges.

2715. In that case they charge for the firkin of butter, and not for the passenger?—Yes.

2716. Do you think that that creates much traffic?—It prevents this, that when these hucksters come to these people to buy, they will not deal with them; they go to the market themselves with their butter. In Limerick we complain of the absence of that accommodation; but probably it is not a question that should be considered when dealing with the question of the general management of the country. From those very points, Tipperary and nearer to Limerick than Tipperary, the charge upon butter is more than twice the price it is to Waterford, for the passenger has to pay his passage as well, so that the company that manages the other line gives a greater inducement to a person to send his butter in the direction of Waterford, and imposes a penalty upon the person sending it to Limerick.

2717. What is the object of that?—The fact is, that the chairman of the company is also the proprietor of the steamships going out of Waterford, and of course by getting the trade to Waterford the vessels earn freights which they would not earn if the trade came, and probably to a better market, in Limerick.

2718. You think that in order to drive the traffic into Waterford he actually allows the passengers to travel for nothing if they bring their firkins of butter with them?—Yes, he allows them to travel for nothing to Tipperary, which is nearer to Limerick than to Waterford.

2719. Is the butter sold in Tipperary?—Yes.

2720. To merchants?—Yes, and it is then sent to Waterford.

2721. Is it carried at a lower rate?—Yes, at a lower rate than to Limerick. I think the rate to Waterford is 9*d.*

2722. Would the same gentleman allow a person going a mile or two from Limerick to go to Tipperary for nothing?—Yes.

2723. Would he let him come into Limerick without paying the high charge?—No, and the consequence is, that in Limerick we feel that it is a very great grievance to our trade. We say that we have a shorter mileage, and we have a cheaper carriage by water, and if we could get an equivalent mileage rate, a certain portion of the trade nearer to Limerick would be done at Limerick instead of at Waterford.

2724. This kind of proceeding discourages trade from Limerick and favours it from Waterford?—Yes.

2725. (*Mr. Hamilton.*) You stated that you had a lower freight, to what place?—We have a cheaper freight from the Shannon by sea.

2726. As compared with Waterford?—Yes.

2727. How is that?—The general water carriage is cheaper.

2728. I understood you to mean that the sea freight was cheaper from Limerick than from Waterford?—No; the steamboat freight from Waterford is cheaper than the steamboat freight from Limerick, being on the other side of the land; but the railway charge being added to the freight makes it higher.

2729. (*Capt. Galton.*) You say that the butter is allowed to be carried very cheaply to Tipperary?—Yes.

2730. It is, I suppose, as near from Tipperary to Cork as from Tipperary to Waterford?—I think not; at all events they must travel over the line of the Limerick and Waterford Company to get upon the line of the Great Southern and Western into Cork, so one checkmates the other.

2731. You say that the butter is sold to merchants in Tipperary?—Yes.

2732. Do these merchants forward it to Waterford?—Yes.

2733. If the merchants there could get a favourable rate from the Great Southern and Western Company they would probably not be induced to send it to Mr. Malcolmson's steamboats?—Probably so.

2734. (*Mr. Horsfall.*) To what extent do you think it would be necessary to reduce the rates both for passengers and goods in order to secure a traffic that would be remunerative to the shareholders?—I cannot venture to offer an opinion upon that. I am not sufficiently acquainted with the charges, or what would pay, to hazard an opinion.

2735. (*Chairman.*) Do you know what the fares were on the Limerick and Foynes line before they were raised?—The increase of the fares was between Limerick and Adare, from 1*s.* 8*d.* to 1*s.* 10*d.*

2736. For how many miles?—I think about seven miles, but I will see exactly by this time table.

2737. Was that the first-class fare?—I think so. Then the increase in the second-class fare was from 1*s.* 2*d.* to 1*s.* 4*d.*; and from 8*d.* to 11*d.* for the third class.

2738. Were those the lowest charges that were ever made?—I think so.

2739. Those were not low charges at any time, if the distance was only seven miles?—It is excessively difficult to get at the exact rate of carriage; we are under the impression that there are several rates made. I believe that the distance from Adare to Limerick is 11 miles.

2740. Is Adare on the line between Limerick and Foynes?—Yes.

2741. Can you give any evidence as to the goods traffic?—Very slightly; I have some knowledge of the management of some property in the neighbourhood, at Bruree, which is under my agency. I find that in that neighbourhood they are very much dissatisfied with the restricted price put upon turf as against coal.

2742. Do they complain that the coal traffic is encouraged at the expense of the turf?—Yes.

2743. Where is Bruree?—It is on the Cork and Limerick direct line. The hauling is done by the Great Southern and Western Company.

2744. From Cork?—Yes; it is between Charleville and Limerick.

2745. (*Capt. Galton.*) Where would the turf go from to that district to which you have just referred, Limerick or Cork?—To the Bruree district, not exactly from Limerick but from Kerry, from a bog called the "Rathmoor" bog on the Great Southern and Western line.

2746. Is coal carried more cheaply to that district than turf is?—Yes, it is.

2747. Can you state what are the relative rates?—Yes, I think I have got them here; a truck of coals from Cork to Bruree, containing five tons, is conveyed for 17*s.* 1*d.*

2748. How many miles?—41 miles. A truck of turf, or waggon, carries three tons; and the cost of conveying that from Rathmoor to Bruree is 1*l.* 7*s.* 9*d.*, the distance being 49 miles.

2749. (*Chairman.*) Does it pass over the lines of different companies?—No, it is hawled by the same company, the Great Southern and Western.

2750. (*Mr. Hamilton.*) 1*l.* 7*s.* 9*d.* for carrying three tons 49 miles?—Yes.

Mr. M. R. Ryan.

17th May 1865.

2751. (*Mr. Horsfall.*) Are there any manufactories at Bruree?—There is a very large flour mill there, indeed it is one of the largest in our part of the country.

2752. (*Mr. Glyn.*) Is it worked by steam power?—I do not know; I know that it is worked by water power. I was going to mention that this state of things is considerably felt by the tenants with whom I have to deal, and by the people generally, because it is one of the most extensive dairy districts in the vicinity of Limerick, and we find from practical experience that turf is much more suited for dairy purposes than coal is, it is much cleaner; and the advantages of it are that it does not soil either those who handle the butter, or the vessels which are used, and the people like it the more for that reason. Experience also shows us, and the people inquire very closely into these things, that it is cheaper; it is lighted immediately and it is extinguished immediately; and altogether there is no dairyman in the country who would not prefer working his dairy with turf in preference to coal.

2753. (*Chairman.*) In what way is it cheaper than coal; does not that depend upon a variety of circumstances, whether it is in the vicinity or far off?—Previously to the advance being made upon it, it had been used extensively in preference to coal, but since the advance has been put upon it its use has been discontinued.

2754. (*Mr. Ayrton.*) Is a low fire required for dairy purposes rather than a quick one?—I think so. The great thing is, that the girls do not dirty themselves, and there is much cleanliness required in making butter.

2755. (*Mr. Hamilton.*) Is the rate you have spoken of an exceptional rate, or is it about the ordinary rate per ton?—It is the ordinary rate.

2756. Have you calculated what it is per ton?—I have not.

2757. It is more than 2*d.* per ton per mile, and do you say that that is not an exceptional rate for the carriage of turf over Irish railways?—I am not aware that it is, it was lower some months since, probably some five or six months since; there was a large quantity of turf coming into Bruree; since that time it has been advanced, and a gentleman informs me by a letter I have received this morning, what I know to be the fact. He says, "The charge "for a box of turf to Bruree had been 18*s.* 6*d.*, and "it is now 1*l.* 7*s.* 9*d.*; great complaints are made of "the want of fuel, and particularly among the dairy "farmers, who were in the habit of getting turf at "Bruree. You must know that the poor people must "feel it also."

2758. (*Chairman.*) Has there been a corresponding rise in the charge for the conveyance of coal?—No.

2759. Is it for the interest of the Great Southern and Western to carry coal rather than turf?—I do not know, indeed, but it is the interest of the steamboat proprietors to carry it, and there is a very large amount of steamboat influence exercised in the directory of this company, and it is the interest of the large steamboat proprietors to get freights for their ships, to the exclusion of our own fuel.

2760. (*Capt. Galton.*) The charge for the coal is a halfpenny per ton per mile, and the charge for turf is about 2*d.* and one-fifth per ton per mile; it used to be 1½*d.* per ton per mile?—Yes.

2761. (*Mr. Hamilton.*) Do you say that the increase in the rate for the carriage of turf is not exceptional, and that it is universal?—It is universal between those points which I have mentioned.

2762. You cannot speak as to other parts of the country?—No; I can only speak as to this particular locality.

2763. Do you attribute it to the circumstance of the railway company being interested in increasing the trade in coal?—I imagine so. I believe that the leading parties are largely connected with steam vessels running from all those ports, Waterford, Cork, and Dublin, and their interest is to bring as much coal as they can into the country for the purpose of getting back freights.

2764. (*Mr. Ayrton.*) How many tons of turf do they load in a truck?—A waggon contains three tons of turf, and a waggon of coal contains five tons.

2765. Do you know whether the not being able to load up to the full weight in a truck has some effect upon the charge for haulage?—Yes, I should fancy it has, but it also ought to be considered that it is a less heavy article to haul and therefore that it runs lighter; if they are paid by weight it is easier for the engine to pull three tons of turf than to pull five tons of coal.

2766. (*Mr. Glyn.*) Are the directors of the Great Southern and Western Railway much engaged in steamboats?—I do not know, but I have said that I thought they were large shareholders; the public men in Dublin are almost all engaged in steam ship companies.

2767. (*Lord Donoughmore.*) Is not Mr. Pyke a very large steamboat owner in the port of Cork?—Yes, he is the principal owner of the line out of Cork.

2768. (*Mr. Hamilton.*) Is there no maximum charge in the Railway Acts beyond which the companies cannot raise the rates for goods traffic?—I am not aware at all.

2769. (*Chairman.*) Have you given much consideration to the question whether any great alteration could be introduced into the railway system in Ireland with advantage?—I have always considered that if we could have all our railways placed under one management the interests of particular towns and particular districts would not be interfered with from any interested motives, particularly as we are circumstanced on the west coast of Ireland; we have no directors there, the railways that run to Limerick are centred either in Waterford, Cork, or Dublin, and the eastern ports of shipment, and I think that those three directories vie with each other to see which port shall get the greatest loading for their steamers, and the port of Limerick does not get a fair mileage rate in consequence of that. As an instance, butter, per firkin, Bruree to Cork, 41½ miles, is 5*d.* per firkin, while from Bruree to Limerick, 19 miles, it is 9*d.*, being double the distance for half the price; that is, the charge to Limerick is fourfold in proportion to that to Cork. Again, timber from Cork to Bruree is charged 6*s.* 3*d.* per ton, while from Limerick to Bruree it is 4*s.* per ton. The proportionate charge, according to mileage, ought to be 2*s.* 10*d.* from Limerick.

2770. (*Lord Donoughmore.*) Is it not the fact that Sir David Roche was for many years a director of the Great Southern and Western Railway?—Yes.

2771. If he had any local interest it was in Limerick, was it not?—Yes, but he never shipped any produce from Limerick; he had a large flour mill in Limerick, but he never exported. I am glad that you referred to Sir David Roche, he has recently died, but his son, the present Sir David Roche, is now the owner of the very large mills there, and I am satisfied that there are very few men in the country who could give more information to this Commission as to the inconvenience which is suffered from the present state of things than the present Sir David Roche. I have known him complain very sadly with respect to his mills; he has one at Croome, and he does not use the railways at all; he keeps a stud of horses on the road, and he does not send a pound weight by the railways.

2772. (*Capt. Galton.*) On account of the high rates which are charged?—I suppose so.

2773. (*Chairman.*) What distance is it from Limerick to the mills you have spoken of?—I think the distance is about 12 miles.

2774. (*Capt. Galton.*) Is the railway communication in the hands of one company?—Yes; it is on the Cork and Limerick Direct line, and the haulage is done under the management of the Great Southern and Western Company.

2775. It appears by the map as if the traffic would run on the line of the Waterford and Limerick ?—No, his produce would run into the Foynes line at Patrick's Well; there is a rental paid of 1,400*l.* a year by the Cork and Limerick direct line, and they run over it. He would have only to deal with the Great Southern and Western Company, who have the line; but he will be able to explain that to the Commission better than I can. I think that the Cork and Limerick directors have a voice in those rates, but the Great Southern and Western Company do the haulage for 40 or 45 per cent., and they have to consult the Cork and Limerick directors upon certain things. I know that Sir David Roche feels it very much. There is another miller in the same town. There are, also, very extensive flour mills belonging to Mr. Lyons, and he also keeps a stud of horses on the road, but he does not avail himself of the railway, though his mills are in the town of Croome, and close to the railway station.

2776. (*Chairman.*) Have you any definite scheme to submit to the Commission as to any alteration you would like to see introduced in the Irish system of railways ?—My view is this : I should feel happy if the government of the country should take charge of the railways for some little time, and try the experiment whether one central management would do for them all. If the experiment was not successful, it could not be more unsuccessful than the present system.

2777. (*Capt. Galton.*) If it proved unsuccessful, how would you meet the loss that would accrue ? by levying a rate upon the different towns in Ireland ? —I should not do that at all The towns in Ireland are now taxed for the support of the poor and other charges to their utmost ability, and could not endure more. I think the nation should be prepared to undertake any such contingency, but in my opinion it would be no loss incurred. I should say, try this experiment, for I think it is really of national importance, having regard to the development of the resources of the country. We have found that since the introduction of railroads, a great deal of good has been done, but not so much as I believe might be done; they have promoted good feeling among the people, and a better understanding with each other, by bringing them together; they travel more about the country, and more money is expended than there was before.

2778. (*Mr. Ayrton.*) But who is to bear the loss, if that is to be the result of the experiment?—I should think it ought to fall upon the country at large. I would extend it to this side of the Channel. Ireland's prosperity or adversity must affect the national interest; and as the people of England are the great consumers of our produce, they have a direct interest in removing the grievance we suffer under.

2779. You would extend the system of reducing fares upon railways to England ?—Yes, if it required it—if the material improvement of the country were retarded by not doing it.

2780. (*Mr. Hamilton.*) If a loss was sustained by the experiment you have recommended, do you think the traffic would recover itself in a few years ?—I do. I am entirely of that opinion. I cannot but believe, when there is a certain amount of population in Ireland, and a certain amount of produce from the soil, which is brought to this side of the Channel, and when I see that going by roads running parallel to railroads, that traffic ought to be got, and would be got, and when once the people would acquire a habit of railway travelling, they would be sure not to return to the old slow system.

2781. If the railway charges were lowered, you believe that there would be an increase in the produce ?—Yes, for I believe that one of the things that prevents that increase is the expense of the transit. When produce is purchased, it is always subject to the charges of transportation; and the higher they are the less remunerative is the transaction to the farmer, and the less he is disposed to produce.

2782. (*Capt. Galton.*) What is the charge made for passengers, compared with what it was before the railways were opened, when they travelled by Bianconi's cars ?—I do not know; but I know that when the first line ran out of Limerick from the Great Southern and Western, in 1848, the rate was only 8*s.* third-class to Dublin, and all the shares were at a premium, and they were able to declare large dividends, but since the increase in the charges those shares have gone down in price, and their dividends have diminished.

2783. Do you know what the fares used to be per mile by Bianconi's cars ?—I do not.

2784. To Dublin, for instance ?—I do not know.

2785. (*Chairman.*) Are there any other matters that you wish to submit to the Commission ?—At the moment I cannot remember.

2786. You have mentioned the most important points within your knowledge ?—I think so; but may add that there are cars running at the present time to certain points upon that line, and there is an immense traffic that is not taken by rail; from the Bruree district there is a four-horse car, and there are others running from Bruff, Kilmallock, and Kilfillan to Limerick; and all people living between Bruff and Bruree, even some of those living in Bruree walk a distance of seven miles to get upon that car, because they only pay half fare. From Bruff to Limerick the charge is only 9*d.* for a distance of 12 miles.

2787. (*Mr. Ayrton.*) Is Bruff upon a railway ?—No, it is seven miles from Bruree; but all those who live midway never go by the railway.

2788. What is the fare from Bruree ?—I think it is 1*s.* 6*d.*; some of the people living about Bruree, which is seven miles off, walk to Bruff.

2789. (*Chairman.*) Is there a railway station at Bruree ?—Yes; there is station in the town. I may quote an instance to the Commission to show how these cars are loaded. Last week a case came before the county sessions, and I happened to be on the bench at the time. A man was summoned for having 40 people on his car when he was licensed to carry only 24, and it was not the first offence. The man said that he could not help it; his evidence was that the people rushed upon the car, and that he was obliged to get the constabulary to assist him. He was only fined nominally 1*s.*, the bench believing that he was not courting trade. This offence is not unfrequent. Those four cars are allowed to carry 20 or 24 passengers each, and prove unequal for the traffic. It is reported other cars are to be put on the road.

2790. (*Mr. Ayrton.*) What was the fare by the car ?—Ninepence for 12 miles. I refer to that case as affording evidence that if the railway fare were reduced to 9*d.*, I do not think anybody would travel on the outside of a car, exposed as they would be to the weather, if they could go by railway.

2791. (*Mr. Hamilton.*) Nor walk ?—No.

2792. (*Chairman.*) Can you give any other instances of cars competing successfully with railways ? —I believe there are other instances, but those I have given are the most familiar to me. I witnessed the other day a very curious thing; some people were coming from Kilrush to the other side of the Shannon; there were about 70 emigrants going to Cork and Dublin, and coming from the west of Clare by Foynes; they arrived in the afternoon at Limerick, and those 70 persons had to remain in Limerick all night, there being no third-class train after that time to take them on to their place of embarkation. Some were going to Cork to embark by steamer for America, and others were going to Liverpool viâ Dublin. There was no means to convey them, and it was most pitiable to see those poor people disappointed in that way, being of course put to very great expense.

2793. (*Lord Donoughmore.*) Is it not the custom with railway companies in Ireland to give special rates for emigrants ?—Not at present; they used to do so but they do not do so now, though they ought, and

Mr. M. R. Ryan.

17th May 1865.

these are the reasons why I think, if there was one intelligent governing body sitting in Dublin, they would not let these things longer exist. I believe that the heavy expenses of separate management and separate establishment charges could be reduced to a considerable extent, which would be a set-off against any losses that might be incurred by the experiment. I know that if I were to put myself in the position of the proprietors of all those lines of railway, or if I had anything to do with them in the way of management, I would have but one governing staff, only one establishment, because I am certain that that would work more harmoniously, and certainly more economically than several.

The witness withdrew.

Dr. M. Longfield.

Dr. MOUNTIFORT LONGFIELD examined.

2794. (*Chairman.*) You are the chief judge of the Landed Estates Court in Ireland?—I am the senior judge.

2795. Have you given much attention to Irish railways?—I have.

2796. Have you formed any opinion as to the effect of the rates now charged upon those railways both for passengers and goods?—I think that we should have more passengers and more goods if the rates were reduced; but I think that we could not reduce the rates without diminishing our profits very much; I say our profits, because I have been for nearly 20 years a director of the chief railway in Ireland.

2797. You are a director of the Great Southern and Western Railway?—Yes.

2798. You are of opinion that it would not be safe for the directors to make any large reduction in the rates, either for passengers or goods?—I am. I think there would be a considerable diminution in our profits for several years at least; in the meantime many of the existing shareholders being deprived of their dividends must sell out and perhaps be ruined.

2799. Upon what grounds do you rest the opinion that there would ultimately be a large increase in the traffic?—Upon this, that there is a natural desire to travel, and there is a great deal of utility in it, and that would be felt more and more, and of course the effect of a reduction of the charge made for a very useful privilege, or upon any commodity, would increase the number of passengers and the consumption of the commodity.

2800. Has your company ever tried the effect of making low charges upon any portion of their line?—At one time we tried the effect of having fourpenny parcel rates, and it did not answer; perhaps it was not tried long enough.

2801. (*Capt. Galton.*) Will you be good enough to explain that?—I mean that it did not pay.

2802. Not the cost?—More than that; but it did not pay enough.

2803. (*Chairman.*) It paid better at the old rates than the reduced ones?—Yes.

2804. (*Capt. Galton.*) How long was it tried?—For about eight months.

2805. (*Chairman.*) Was there any considerable increase in the parcels traffic?—Not enough to justify its continuance.

2806. (*Mr. Gower.*) What was the reduction made from?—It varied; it was from 8*d.* and 1*s.* to 4*d.*

2807. (*Chairman.*) Was there any perceptible increase in the number of parcels sent?—Indeed we thought not. I think it is probable that the reduction was not well known. I was not satisfied that it had had a perfectly fair trial.

2808. Have any other experiments been tried upon other descriptions of traffic on that line?—I do not think there has been any experiment made; we are rather afraid of experiments.

2809. Do you think there would be a considerable increase in the passenger traffic if the fares were considerably reduced?—Yes; but not of course so much as in England, for the working classes are not so rich, and time is therefore not so valuable; they are not so well able to pay. Then the agricultural traffic does not admit of the same increase that the commercial traffic does; for instance, a fat beast has only one occasion in its lifetime to travel to town, and that is to be killed and sold.

2810. (*Capt. Galton.*) Is it not the case that cattle are sent from one part of Ireland to another to be fed?—They are first bought by the graziers, who fatten them, from the people who breed them.

2811. Is there no opportunity of sending them by railway to the place where they are to be fattened?—Yes, there is some opportunity to send them, not very much.

2812. Is there a very large cattle traffic on the Great Southern and Western Railway?—There is a considerable traffic, but it has become diminished of late years with the reduction in the quantity of cattle in the country.

2813. (*Chairman.*) Is it chiefly fat or store cattle?—On the Great Southern and Western line it is chiefly fat cattle; there is a great number of store cattle driven along the roads, and some people attribute that to the high rates charged upon railways, but the reason, in my opinion, is that driving is more convenient, and for another reason, which is this, that the people who drive them sell them along the way to their customers, merely taking them from town to town.

2814. (*Lord Donoughmore.*) Supposing a Midland grazier buys a couple of store cattle in the fair at Ballinasloe, would it not be natural to get those cattle carried by railway at a reasonable rate so as to convey them to Meath sooner than by driving them along the road?—I think it is probable that if the charge for the carriage was very cheap he would do so.

2815. Do you think that a rate that would tempt a grazier to send his store cattle by railway would be so low as to be unremunerative to the railway company?—It would remunerate us, but not so much as the present rates, at least it would be doubtful, and people do not like trying experiments when the dividends are rather low.

2816. (*Capt. Galton.*) Your dividend is reduced from what it was, is it not?—Yes.

2817. To what do you attribute that?—To the bad harvests in the country, which have diminished the wealth and the population in the country to a great extent.

2818. (*Mr. Ayrton.*) Have you made any inquiries as to the quantity of store cattle driven along the roads and the quantity of cattle carried by railway with a view to ascertain whether there is really a diminution in the quantity carried on account of the excessive amount of the charge made?—Inquiries have been made, although not in a very official way; but inquiries have been made about the exportation of cattle from Ireland and the importation into England, and I have been informed that it has become reduced in about the same proportion as the number of the cattle that we have carried, showing that there has been a general decrease and that it is not confined to our railway.

2819. Apart from that, have you made any inquiries as to the cost of driving cattle as compared with carrying them by railway, which leads you to believe that you do not get all the traffic you ought to do on the railway?—No; but I am sure that the traffic would increase if we diminished the rate, although I cannot say in what proportion.

2820. (*Chairman.*) Does your board ever take into consideration any proposals which hold out a prospect of any increase of traffic of any description, minerals or otherwise?—Yes; if any person makes a sug-

gestion, that suggestion is taken into consideration, and we act accordingly.

2821. Have any proposals ever been made to your board which, after consideration, you have thought it advisable to decline?—A good many. We generally do decline them, for they are frequently made very recklessly by persons who promise a very large increase of traffic, and then when we come to inquire into it we find these persons have been consulting their own interests very much, and that there is nothing to countenance the idea that an increase of traffic will arise.

2822. Has there been any material increase upon any description of traffic within the last few years?—I do not think there has been.

2823. You do not think that any reduction in the rates charged could be made with profit to the railway companies?—I think with ultimate profit it could be, but not immediately.

2824. Upon what articles chiefly do you anticipate that a large reduction of the rates would ultimately bring an increased return to the railway companies?—I hope it would in coal, and probably in minerals. I think that the people would gradually find out the advantages to be gained by travelling and by the transmission of goods by railways; and (although we do not anticipate it beforehand), I think a great deal would arise from unexpected quarters.

2825. We have been informed that there are some mines in Tipperary, which I believe have been under consideration?—Yes.

2826. (*Lord Donoughmore.*) It is in evidence that there are mines in the county of Tipperary, the Adare mines, situated not very far from the Birdhill station, about six or seven miles from Birdhill, and that a railway should be connected with those mines, and it has been stated that the rates of carriage are so high as practically to prohibit the export of all the poorer descriptions of the ores. Have any complaints been addressed to you upon that subject?—I do not remember any, but I am sure that if the proprietor would show that he would supply us with sufficient traffic to return us a profit we should be glad to carry it.

2827. Would you be inclined to open a special station or make a special siding for him if he could show you that he could supply you with a certain number of hundred tons per week?—Certainly I should be in favour of it, and the entire board, I think, would willingly listen to it or to anything that we should not lose by.

2828. The witness stated that practically the rich ores are sent by cart from the mines to Birdhill, where they are placed on the line of the Castleconnell and Limerick Railway, and sent by Waterford to England, but he stated that if the Great Southern and Western Company would give him full facilities it would pay him better to send them by that line and from Dublin to England. Is it possible, do you think, for your board to tempt that gentleman to send his ores by Dublin instead of Waterford?—Until I know what he expects I could not say; but for the sake of getting traffic I am sure that the board would do everything that was reasonable, and that they would reduce their profit as low as possible.

2829. (*Mr. Glyn.*) If the proprietor was ready to send you a given quantity, you would reduce the rate now charged to a lower rate?—Yes, if he sent us full train loads.

2830. You would reduce the rates to him?—Yes.

2831. (*Mr. Ayrton.*) Has this subject ever been under the consideration of your board?—I do not remember the subject of the mines ever coming before the board, but the subject of reduced rates on particular occasions is discussed almost every board day.

2832. (*Chairman.*) But you have scarcely ever decided upon making any experiments?—Very seldom.

2833. (*Mr. Ayrton.*) I understand that when these suggestions are made you direct special inquiries into the supposed sources of increased traffic, and you are guided by the result?—Yes.

2834. (*Mr. Glyn.*) I believe that some years ago, when Mr. Thomas Smith was one of the directors of the Great Southern and Western, he advocated very strongly a reduction of fares, founded upon his experience in England?—He never attended the board except upon a few occasions. I do not think that he attended twelve board meetings in his life.

2835. Did he not advocate a reduction of the rates?—I think he did several years ago, and another English director, who is now deceased, Mr. Boothby, opposed it.

2836. The subject has been very much discussed, has it?—Constantly.

2837. (*Chairman.*) Do you know whether a train to carry third-class passengers from Limerick to Dublin by Nenagh has ever been under the consideration of your board?—Yes.

2838. We have been informed that there is no train at present?—There must be a third-class train. According to the Act of Parliament we are obliged to carry passengers at a penny a mile once a day.

2839. I believe there is a third-class train from Dublin to Nenagh, but none between Nenagh and Limerick?—There must be; the company can be compelled to provide it. It is not our line, but the railway company can be compelled to run a third-class train from Limerick to Nenagh.

2840. Have you any power over the line from Nenagh to Limerick?—Yes.

2841. Have you running powers from Nenagh into Limerick?—Yes, I think so.

2842. (*Mr. Glyn.*) It has been stated that there is no possibility for a first-class passenger to get from Limerick to Dublin and back again conveniently in the same day; is that so?—I cannot say; but looking at the time table I think it is not improbable, and I think it is likely they would not much care for the privilege, for there is some little disadvantage in consequence of it, for in going from Limerick to Dublin they have to pass over two lines of railway not belonging to the same company, and which are not always working harmoniously.

2843. (*Mr. Ayrton.*) Are they at present in harmony, or is there much discord between them?—Not so much harmony as I should wish.

2844. Have you any joint committee to manage the traffic that is required to be worked through?—No.

2845. (*Lord Donoughmore.*) Was there not some time ago a proposition made on the part of your board of directors to amalgamate with the Waterford and Limerick Railway Company?—Yes.

2846. And that proposition was refused by the directors of the Waterford and Limerick line?—By the shareholders. I do not know whether the directors were favourable to it or not, but it was refused.

2847. Do you believe it would be a great advantage to the public if those two railway companies could be amalgamated?—Certainly.

2848. Would it facilitate the traffic arrangements all through that country?—Yes.

2849. (*Chairman.*) You could not offer terms to the Waterford and Limerick Company that they would accept?—No; and with regard to the terms that were then rejected, I thought they were a great deal too high, and I opposed them.

2850. (*Mr. Gower.*) The negotiation failed as to the terms?—Yes. We offered what I considered were too high terms, and they thought that they would be better by standing out for a time.

2851. (*Lord Donoughmore.*) Have the earnings of the Waterford and Limerick Company, since that offer was made and declined, been at all equal to the terms offered by the Great Southern and Western Company?—No; neither since that time nor before it, but whenever a negotiation is pending the public necessarily know it, and that raises the price of the line that is to be bought, and then the shareholders think that that rise in price is part of the intrinsic

Dr. M. Longfield.

17th May 1865.

value of the line, and they insist upon something more, and all these things cause delay.

2852. (*Mr. Ayrton.*) Have you ever been able to form any definite idea as to the percentage of reduction necessary to produce an increase of traffic, and the probable number of years that would be required to bring back the income to its present state on the Irish railways?—I think that everything of that kind must be merely vague conjecture. I think that every reduction of rates will produce some increase of traffic, and the greater the increase the longer the period that must elapse before it has its full effect upon the country.

2853. Have you considered the question sufficiently to be able to reduce the general proposition to any practical figures?—I should not venture to do so, it is entirely a matter of conjecture. A sanguine man will say that it will take place in four years, and another man will say it will take ten years, and another that it will never take place.

2854. Have you considered the matter sufficiently in detail to be able to suggest any particular item of traffic that would be capable of great development and increase consequent upon a reduction of the rates?—I think that corn and coal and third-class passengers would be the chief; but I think that a great many others would arise unexpectedly.

2855. With regard to coal, do you think that traffic in coal would arise from displacing the consumption of turf, or from increased consumption by manufactories, or for domestic purposes?—From all three causes. A great many persons would burn coal instead of turf, and a great many lines which are now inadequately worked would have greater returns from the increased consumption of fuel, and it also might assist in promoting the manufactures of the country.

2856. With regard to corn, in what way do you think that an increase in the quantity of corn carried would take place?—I think it is probable that there would be a great deal of corn sent backwards and forwards, according to the state of the local markets, if it was carried with sufficient cheapness.

2857. Apart from the movement of the existing quantity, it seems, from your experience in the cattle trade, that we should have to look entirely for an increased production in corn to agriculture?—I think not. I think that circumstances would enable corn to be more readily transported from place to place, but less for some time than in the case of cattle.

2858. With regard to the unexpected sources of traffic, to what sources do you refer, to minerals?—When I say unexpected, I can hardly venture to say what they would be; but I think that special trades will arise in the country, and that the people will find that such things as eggs may become a great article of traffic, and perhaps poultry, and a number of other things.

2859. With regard to third-class passengers, do you think that a new class of passengers could be set in motion, or that the existing passengers would travel more frequently?—I believe that both things would happen. I think that the people would more readily go in search of employment, and that they would go for lighter motives when they found that the fare was much reduced.

2860. Is there much tendency in Ireland to move about in search of employment, or are the people very constant to their particular locality?—They go great distances in search of employment.

2861. Have you formed any opinion as to the percentage of reduction that would be necessary to promote a great increase in the third-class passenger traffic?—I think that reducing it to a halfpenny a mile would produce a great increase; that would be 50 per cent., and of course by reducing it further we should get more.

2862. At the present time do the tradesmen and shopkeepers and small farmers all travel third-class in Ireland?—Most of them do.

2863. Do the peasantry travel third-class, and mechanics, or do they walk?—The peasantry do not travel very much at all; they walk, except just for emigration purposes, when they have some luggage to carry.

2864. Do you think that at a halfpenny a mile they would be induced to travel by railway rather than walk?—A great many more would, of course.

2865. (*Capt. Galton.*) Have you tried to develope any third-class traffic in the vicinity of the markets by issuing return tickets at low fares, as upon our English railways?—No; but it has been spoken of, and probably it will be carried out before long; but we have not done it hitherto.

2866. Have you made no attempt to develope third-class traffic in that way?—No.

2867. Or in any other way?—No.

2868. (*Mr. Hamilton.*) Why have you not?—Of course, because it was not likely to be conducive to the interests of the company.

2869. (*Mr. Gower.*) You have stated that the directors are afraid to make experiments; are they more timid, do you think, than they need be, or, in other words, if they were less timid do you think it would be for the advantage of the railway companies?—In some cases they are not so timid as in others; I think they might make a few experiments with safety.

2870. (*Chairman.*) You cannot say that the directors ought to make experiments on a large scale?—No, I think they ought not.

2871. You are satisfied that ultimately there would be no loss?—Yes; and in the meantime there would be no loss at all proportioned to the gain that there would be to the public.

2872. Have you considered how the experiment is to be tried?—Yes, and the only way of trying it that I think is safe, would be to give the Government the power to nominate an official director on any line of railway that they thought proper; that official director to have full power of consulting the books and voting upon everything in the same manner as other directors, requiring information from the officers, and so forth. I would then let that official director make any experiments that he liked, guaranteeing the company against loss arising from the experiment so made, and receiving half of the gain in case there should be gain from it.

2873. Where is the guarantee to come from?—From the taxes of the country; I can see no other source but that.

2874. (*Capt. Galton.*) With regard to these experiments, you say that you should object to making experiments on a large scale?—Yes.

2875. Would not the experiment of issuing tickets at low fares on market days be a pure gain to the railway company?—Yes, if they got enough to exceed the working expenses, which are about 2*s.* 8*d.* a mile.

2876. You have certain trains which run between certain places?—Yes.

2877. And it would be only adding a certain number of additional carriages to those trains; could not more carriages be put on?—Unless we reduced our fares there would be no use in doing that, there are always carriages enough.

2878. If you issued return tickets on market days, in order to develope a traffic, would not that be an experiment that would cost nothing, comparatively?—It would not cost very much.

2879. That experiment, which would have a tendency to develope traffic, might be made without calling on the country to pay any loss that might arise?—It is not quite so simple as it appears to be, because it is to be remembered that it is very probable, in most cases, the hours of our trains would not suit the market purposes; and in order to make them useful, we should have to run them specially.

2880. (*Chairman.*) You think that you could not adapt many of your present trains to that purpose?—Very few of them, unless by accident in some particular case.

2881. (*Capt. Galton.*) The experiment in that particular case might be tried ?—Yes.

2882. (*Mr. Hamilton.*) You are aware that in England it is regarded almost as a duty on the part of railway companies to provide facilities for moving about on market days, whether they yield a profit or not ?—I do not know that they do anything from a sense of duty that does not lead to a profit.

2883. On market days you will find that some distances are travelled over at very much lower fares than on ordinary days ?—If they do that in fact, the profit to the railway and the utility to the public, in such cases, nearly go together; but unless there is a profit you do not do much good to the public. I will mention a circumstance to show how erroneous the idea is that an increase of traffic might produce an increase of the expenses ; any book on the statistics of railways will show that the traffic varies between 20*l.* a mile and 75*l.* a mile ; some railways have as little traffic as 20*l.*, and others as much as 75*l.* ; but you will find that the proportion of the working expenses is about the same in both.

2884. (*Mr. Ayrton.*) What is your view with regard to repaying any loss that might be occasioned by the Government director reducing the rates ? Is that to be repaid out of the increased income over and above that at which he found it when he made the reduction ?—Certainly, in the first instance, and if that did not pay it, then the nation should pay it if they required a compulsory reduction to be made.

2885. Do you say that whenever the income of the railway went beyond the point at which he had commenced the reduction, then that the surplus income should be appropriated to making good any loss the country might have incurred by the reduction ?—I see no objection to that.

2886. (*Capt. Galton.*) If all the loss was to be made good to the railway company, would not that be rather taking away from the directors an inducement to work very economically ?—I think not, especially if the company got half the gain and the other half only went to the nation.

2887. (*Chairman.*) By your plan the special director could insist upon any reduction being tried that he thought proper ?—Yes, and upon any increase in the number of trains, or anything that he thought would be convenient to the public.

2888. (*Mr. Ayrton.*) You would take as a basis the contracts which exist between the Indian Government and the railway proprietors, only taking the dividends at the present amount rather than five per cent. ?—Yes, nearly so. I do not understand that the Government has had the complete power over the Indian railways that I would give the official directors over the Irish railways.

2889. (*Chairman.*) If your scheme was tried, is it important in your opinion that some of the smaller lines should be amalgamated with the larger companies ?—I think it is ; to have a complete network there should be amalgamation, but substantially they would be amalgamated if they had an official director on each railway ; he would be supreme on all points.

2890. (*Mr. Ayrton.*) If your system is carried out on one of the larger lines—your own, for instance—that would be a sufficient experiment to test the full value of it ?—I think it would. I think that some lines should be selected that would obviously afford a fair experiment. A short suburban line would not do so, for by reducing the fares there you can increase the traffic indefinitely.

2891. (*Mr. Glyn.*) All the lines ought to be worked under the same system ?—Yes, to have it well carried out.

2892. (*Lord Donoughmore.*) Would there not be this difficulty, supposing that the Government took into their hands the management of one of the larger lines in Ireland, or placed it under the management of an official director, guaranteeing the shareholders of the company against loss, that if that line competed with the line of another independent company at any point, it would in fact be Government capital competing in the market against private capital ?—Yes, that objection is apparent, and, of course, that fact should be before the official director when he was reducing the fares ; and he should either take a great network of railways into his consideration, or take care that in making the reduction he did not compete improperly with a rival line.

2893. (*Chairman.*) Is there any part of the Irish system on which you think the experiment could be tried without much clashing with the interests of other companies ?—If you take the great buff line on the map, with the exception of the line from Athlone to Tullamore, there would be no clashing with any rival line.

2894. (*Mr. Ayrton.*) You are speaking of the lines as they now are ?—Yes.

2895. (*Chairman.*) Is it necessary, do you think, for the Limerick and Waterford line to be included in the scheme ?—Yes, I think it ought to be.

2896. Is there a line for which an Act has been obtained between Wexford and Waterford ?—I am not aware of such a line.

2897. If there was a communication between Waterford and Wexford it would be almost necessary, would it not, to include the Wicklow and Wexford line in the scheme ?—If new lines were made it might be necessary to enlarge the scheme, but under the scheme they would have an opportunity to make the trial very fully before any new line came into operation.

2898. You would leave out the section between Tullamore and Athlone ?—Yes ; I think it is necessary to do so, and it would obviously be no inconvenience to the inhabitants, because they have the other way of going to Dublin, and going very well, a little shorter.

2899. (*Mr. Hamilton.*) Have you through booking rates with all the railway companies ?—We have through booking rates with the Limerick and Waterford Company. I am not aware that there is an opportunity of having through booking rates with any other company.

2900. Not in the north of Ireland ?—No, I do not think we have.

2901. Have you through booking rates with any of the railways in this country ?—I believe we have for excursion trains, but there is very little of it.

2902. Not for general traffic ?—For goods we have.

2903. Not for passengers ?—I am not aware that we have, except for excursions.

2904. (*Capt. Galton.*) Do you run any excursion trains ?—Yes, occasionally.

2905. How many in a year ?—I cannot tell you, but not very many.

2906. Do they fill well ?—Whenever we run them they do fill well, but I am not very favourable to them, because I think they interfere with the general traffic. I would rather have all the trains cheap than run occasional trains excessively cheap.

2907. You do not seem to run all the trains at low fares ?—No ; but if any reduction were made I would rather give every one the benefit of it than have those crowded excursion trains, which are a little dangerous and interfere with the regular working of the lines.

2908. Do you charge lower fares to reapers coming to England at a certain time of the year ?—I do not think we do ; the reapers are almost all from the west.

2909. (*Mr. Hamilton.*) With regard to through tickets, take Killarney for instance, according to your system, could a person, being in London, take a through ticket to Killarney ?—Yes.

2910. By which route ?—If he took a through ticket from London he would go to Holyhead by the London and North-western line, and then cross over to Dublin, and then go by the line which you see on that map, through Templemore, Thurles, and Mallow, and then branch off to Killarney.

2911. Supposing he wanted to go by South Wales, could he not get a through ticket in that way ?—Not from us.

Dr. M. Longfield.
17th May 1865.

2912. (*Capt. Galton.*) You do not issue through tickets by the South Wales line ?—No, I do not think so. We were never asked to do so. We should not object, but they are not worth giving ; the traffic would be very trifling.

2913. (*Mr. Hamilton.*) It has been stated to the Commissioners that an application has been made to the company and that it has been declined ?—I was not present when it was made. I have no objection to it, but I should imagine that the traffic would be very slight.

2914. (*Mr. Ayrton.*) Has it come under your notice that the traffic from Tipperary to Waterford, and from Tipperary to Limerick, is regulated by other considerations than those of the distance ?—Yes ; it is very well known that the most influential proprietor in the Waterford and Limerick Company has a very considerable interest in the port of Waterford, and that he does his best to develope the traffic to Waterford.

2915. Has that been a source of embarrassment to your company in making traffic arrangements to go from one line on to the other ?—That has been our opinion, but whether just or not I cannot say.

2916. (*Chairman.*) Your line has no communication with the deep water at Dublin ?—None.

2917. Do you think it would have a tendency materially to increase the traffic upon your line if it communicated with the water at Dublin ?—I know that that opinion is entertained by some, but there are many who do not entertain it. I do not think that the traffic would be materially increased.

2918. I believe you consider that the coal traffic is one which is capable of great increase ?—Yes.

2919. Would not communication with the water materially increase the facilities for conducting the coal traffic ?—I think it would ; as to passengers I think it would have not much effect ; a man pays 1*s.* and he gets to the Kingstown station, and for another 1*s.* he gets to the packet.

2920. (*Capt. Galton.*) Still he has to go across in a car ?—Yes, he has.

2921. Is not every change of that sort an inconvenience ?—It is so slight in comparison to the whole journey that one can hardly think it would seriously affect the traffic ; for instance, if a man was going from Mallow to London I do not think it would matter if he travelled upon a car three quarters of a mile.

2922. (*Chairman.*) Is your coal traffic chiefly from Cork or from Dublin ?—From Dublin. There is not much from Cork. I think we forward it to Mallow, but we find it very insignificant.

2923. (*Capt. Galton.*) Do your rails run down to a wharf at Cork ?—They run down to what was intended to be a dock, but that has rather failed.

2924. Has the coal to be carted both at Cork and in Dublin ?—No, the coals can be brought up very close to our line at Cork.

2925. Can they be lifted from the ships into your trucks ?—No, they are landed into a yard which is quite close to the trucks. I think Mr. Pyke has a coal yard quite close to us.

2926. (*Chairman.*) The coal traffic is not of very great importance, is it ?—No.

2927. (*Mr. Glyn.*) In Dublin they are carted ?—Yes, for a considerable distance, at a cost, I should think, of about 2*s.* a ton.

2928. (*Capt. Galton.*) Have you ever been asked to give low rates for coals ?—It has been suggested, and we have frequently had the matter under consideration, but we have never reduced the rates materially. The rate is now about a penny a ton per mile.

2929. Twice as much as it is in England ?—Yes.

2930. (*Mr. Glyn.*) If you dealt largely in the coal trade must you not carry the railway down to the water side ?—I think that to have a large coal trade there should be such a connexion in Dublin, for 2*s.* a ton is a great impediment.

2931. (*Chairman.*) Does that include everything, all the charges between the ship and the railway ?—Yes.

2932. Do you wish to state anything further with regard to the official director ?—No ; I do not think any further explanation is necessary. I had been writing on the subject, and I handed the paper to a gentleman, but I have not seen it since.

2933. (*Mr. Ayrton.*) Does the penny a ton include the trucks ?—Yes.

2934. Does it include all the terminal charges ?—Yes.

2935. (*Chairman.*) Are you prepared to put in the paper you have written as part of your evidence ?—I do not think the paper is evidence, for it was rather intended to form the basis of a pamphlet.

2936. Have you any objection to its being put into the Appendix ?—No. (*The same was handed in, vide Appendix* F.)

The witness withdrew.

Adjourned to Friday next at 12 o'clock.

Friday, 19th May 1865.

PRESENT :

The Right Hon. the Earl of Donoughmore.
The Hon. E. F. Leveson Gower, M.P.
Sir Rowland Hill, K.C.B., F.R.S.
T. B. Horsfall, Esq., M.P.
Robert Dalglish, Esq., M.P.
Geo. Carr Glyn, Esq., M.P.
A. S. Ayrton, Esq., M.P.
Capt. Douglas Galton, R.E., F.R.S.
William Pole, Esq., F.R.S., *Secretary.*

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S., Chairman.

The Right Hon. the Earl of Lucan.
19th May 1865.

The Right Honourable the Earl of Lucan examined.

2937. (*Chairman.*) Your lordship is chairman of the Great Northern and Western Railway Company of Ireland ?—I am, and I have been so since the formation of the company.

2938. Will you be so good as to state where that railway runs from ?—It runs from Athlone to Castlebar ; the line is constructing from Castlebar to Westport, and we have an Act to extend from Castlebar to Ballina.

2939. (*Mr. Glyn.*) When opened the total length will be 106 miles, will it not ?—Yes, of which 72 are open.

2940. (*Chairman.*) Are you of opinion that Ireland has not derived any great advantage from railways up to the present time ?—I think that the material interests of Ireland have not benefited to the extent to which they ought to have done.

2941. Are you of opinion that under a different system of management those material interests would have been more largely benefited ?—Undoubtedly. I have devoted myself to the construction of the line from Athlone under the conviction that nothing ought to benefit Ireland so much as railways. I consider that the reason why the railways have conferred so

little benefit upon Ireland is that the companies are too poor to work the traffic at prices which would encourage the people to make use of the railways.

2942. (*Mr. Glyn.*) The receipts are so small?—The receipts are very small. In the case of our own company I am firmly of opinion that, if we could afford to have a smaller dividend for the next four or five years, by lowering our fares considerably, not less than 50 per cent., at the end of five years we should pay a larger dividend than at present.

2943. Are you carrying on your railway now nearly at the maximum rates?—Yes; the fares are very much the same as the fares which exist in England. For first-class passengers we charge per mile $2\frac{1}{10}d.$; the second-class is $1\frac{6}{10}d.$; and the third-class fare is $1d.$

2944. (*Mr. Horsfall.*) What dividend does that line pay at present?—We have paid from the time of opening to Castlebar up to last January three per cent. In January we paid $2\frac{1}{2}$ per cent.

2945. (*Capt. Galton.*) Do you run many passenger trains per day between Athlone and Castlebar?—We run very few trains. From Athlone to Castlerea there are daily, excepting on Sundays, a passenger train, a night mail, and a goods train; from Castlerea to Castlebar there are only a passenger train and a goods train daily, but our goods trains carry passengers in carriages attached for that purpose.

2946. Then no one could go from Athlone or Roscommon to Castlebar and return the same day?—No.

2947. Then that is a passenger train?—It carries passengers, but is very slow and very irregular.

2948. (*Mr. Glyn.*) Do you charge the same rate for the passengers who go by the luggage train?—Yes.

2949. Then there are no low fares to that particular train?—No. Our line is worked by the Midland Company under a ten years' agreement, and they put on what trains we desire, at a cost of $1s.\ 6\frac{3}{4}d.$ per mile between Athlone and Castlerea, and $2s.$ per mile from Castlerea to Castlebar.

2950. (*Mr. Glyn.*) You taking all the receipts?—No; they take the receipts and pay us the balance. We work the line at about 40 per cent.

2951. Is the accommodation in respect of the facility of getting from one place to the other very much better than it was before the railway was opened?—Certainly, I do not mean to say that the railway has not been a great convenience.

2952. (*Capt. Galton.*) If no one can go and come back in the same day from Athlone and Castlereagh or Castlebar, is that a developement of the traffic which is sufficient to induce a large traffic?—No, I do not think it is; I think it is insufficient. It is certainly insufficient between Castlereagh and Castlebar.

2953. (*Mr. Glyn.*) Have you the power of calling upon the Midland Railway Company to put on more trains?—Yes, they are very glad to put on as many as we like.

2954. Under the terms of your arrangement?—Under the terms of our arrangement they must provide us with any number of trains we ask for.

2955. (*Chairman.*) Has your board ever considered the propriety of trying the experiment of running trains at cheap fares?—If our line were completed, no doubt we could afford to do so, but we could not at the present time, and for this reason, we have the greatest possible difficulty in floating even our preference shares, and it is manifest that unless the ordinary capital is paying a dividend, the preference shares will not float, and are valueless; and it is upon them that we must rely for completing our extension to Westport and Ballina.

2956. (*Capt. Galton.*) Do you think it will not be possible to try the experiment of reducing the fares on a certain class of traffic in the first instance; for example, carrying your third-class passengers cheaper, or coals. If you carried one particular commodity at a time at a low rate would that create a great loss?—A greater loss than it would be prudent for us to incur under present circumstances. At present our trucks travel at $6d.$ per mile for the first 50 miles, at $5d.$ per mile for the next 25 miles, and $4\frac{1}{2}d.$ per mile the remaining distance; the cost of a cattle truck between Castlebar and Dublin is $60s.$, which is very much too high.

2957. That you pay to the Midland Company?—No, this is the charge to the public.

2958. Who finds the trucks?—The Midland Company find everything, work the traffic, and maintain the line.

2959. You fix the charges?—We fix the rates and the fares.

2960. You fix your goods rates, do you not, at so much per ton, or is it so much per truck?—Sometimes the one and sometimes the other; we generally entrust the manager of the Midland Company to charge the Midland rates and fares on our line.

2961. (*Mr. Glyn.*) How long has the line been opened?—It has been opened to Castlebar between two and three years.

2962. Has there been any increase of traffic upon it during those three years?—There has not; on the contrary, there is a small decrease in the present half-year when compared with the corresponding half-year of 1864. Our receipts do not amount to $7l.$ per mile per week; did we receive $10l.$ per mile weekly, we should pay five per cent. upon both ordinary and preference capital.

2963. What is the amount of the paid-up capital, including the borrowed capital?—581,000$l.$ The debenture capital of 413,000$l.$ is held by the Government, from whom we are now borrowing a further sum of 21,000$l.$

2964. (*Mr. Glyn.*) How much do you want to complete the railway?—The whole of our authorized capital; we have still 70,000$l.$ of preference shares, and 61,000$l.$ of debentures to raise.

2965. (*Capt. Galton.*) What interest do you pay upon the Government securities?—The money was advanced to us at five per cent., but I succeeded last year in getting Mr. Gladstone to reduce it to four. The Treasury are making an alteration which I think will be troublesome; they propose converting the loan into a 22 years' annuity.

2966. (*Mr. Glyn.*) At $6\frac{1}{2}$ per cent., or at what rate?—The capital sum is 113,000$l.$; the proposed annuity is 7,819$l.$

2967. That would be a much larger pressure upon your company?—It would be exceedingly inconvenient to us, because every year we should have to go into the market to borrow money to keep up the debenture capital to its full amount.

2968. (*Capt. Galton.*) Why?—Because the debenture capital, forming one-third part of the capital of the company, was used in the construction of the line, and could not properly be paid off out of revenue. We should be driven to raise money at five per cent. to pay off the capital portion of the annuity, which now only costs us four per cent.

2969. (*Mr. Glyn.*) Your preference would come second?—Yes.

2970. (*Mr. Gower.*) What interest do you pay on the debentures?—We are paying four per cent.

2971. (*Chairman.*) What is your preference stock?—Our preference stock pays five per cent. We cannot float it in London. I think that the best preference shares are not worth more than 90 or 95 per cent. at the present time.

2972. (*Capt. Galton.*) Are you speaking of Irish preference shares?—Yes; I think at this moment it is impossible to get more than 90 per cent. for our preference stock. Few people are aware how very low Irish credit is in the London market. If the Commission will allow me, I will relate what once happened to me. I was taken by Mr. Hankey, the banker, to the Bank of England, and was introduced to the governor and the deputy governor. My object at that time was to get the Bank of England to advance money upon our debenture stock: those gentlemen heard me, and Mr. Hankey, who was connected with the company, confirmed all I said; it ended by the governor telling me—"This is all

The Right Hon. the Earl of Lucan.

19th May 1865.

"very good. If you wish it, I will put it before the "Board of Governors to-morrow; but allow me to "inform you the Bank of England have never yet "advanced one farthing upon an Irish security, and "in my opinion they never will." There is a certain word often used, "lock-up;" an Irish railway security is considered in the English market a "lock-up," that is, not a saleable security. I have no hesitation in saying that the difference between a Government English security and an Irish security would be as between 90 and 130 per cent.

2973. (*Mr. Glyn.*) Would not this annuity materially interfere with your preference stock? How can you keep up your payment of five per cent. on preference stock if you are obliged to find 6½ per cent. on debenture stock?—We must borrow to pay part of the annuity, as we cannot deprive the shareholders of their dividend.

2974. Has this been done as a boon?—It has, I believe, been so intended, but it is a great mistake. I strongly suspect that the object is to secure a more regular payment of the instalments, which have been badly paid. By combining interest and principal, Mr. Gladstone thinks he will secure the regular payment of both.

2975. In fact it is making a sinking fund for the payment of the principal the first charge upon the railway?—Certainly.

2976. (*Capt. Galton.*) Is it not the custom almost always with the Exchequer Loan Commissioners to lend money in that way? Is not the other mode of lending it exceptional—for instance, the money that was lent to the people in Ireland for improving their land?—Those advances in Ireland were not made by the Loan Commissioners, but were granted by Parliament.

2977. (*Chairman.*) Can you state to the Commission any facts on which you base your opinion that a large reduction of fares would ultimately pay the company?—I think that, unless you reduce the fares 50 per cent., you will not materially increase the traffic. I would propose that the first-class passenger should be carried for 1*d.* per mile, the second-class passenger for ¾*d.* per mile, and the third-class passenger for ½*d.* per mile. I would propose that the truck, which I believe is generally charged in England 6*d.*, and also in Ireland 6*d.*, should be reduced to 3*d.* I would propose that all heavy goods be carried for ½*d.* per ton per mile. I have not the smallest hesitation in saying that, if this could be done, in the course of four or five years there would be such an increase of traffic as would entirely restore the revenue. But the thing I look to as most important is the transport of cattle. In the west of Ireland store beasts are not put upon the railway, but travel by the road. A truck would take ten store beasts. If they could be carried for 3*d.* per mile, I feel sure that there would not be a single beast in that part of the country which would not travel by rail. Again, with regard to heavy goods, my belief is, that the whole of the corn of the country would be sent by rail, if it could reach Dublin at ½*d.* per ton per mile, or at a cost of 6*s.* 3*d.* for the 150 miles.

2978. Do they send away much grain?—An immense quantity of grain now leaves the west of Ireland by sea. At the rates I propose, not only grain, but potatoes would be sent by rail in large quantities; in short, the heavy traffic would be enormously increased and more than doubled.

2979. (*Sir R. Hill.*) Do you think this would require time?—I think it would require some four or five years.

2980. Is your lordship prepared to recommend any means of meeting the deficiency which would arise meanwhile?—I think the only course to take is for the Government to possess themselves of the whole of the railways in Ireland.

2981. (*Mr. Glyn.*) In what mode? Do you recommend that they should buy them up?—Yes.

2982. At the present price of the stock?—No, Government should negotiate, and my belief is, that the whole of the ordinary stock of the railways could be purchased at 75 per cent. by a 3½ per cent. stock, which would virtually be purchasing the ordinary stock at about 50 per cent. of the nominal value.

2983. (*Lord Donoughmore.*) That is on the average?—Yes.

2984. (*Sir R. Hill.*) Half the sum which has been expended upon them?—No, I am talking of the ordinary stock only.

2985. (*Mr. Glyn.*) What proportion would the share capital bear to the loans?—Two-thirds.

2986. (*Sir R. Hill.*) Of the 30,000,000*l.*, 24,000,000*l.* are ordinary capital?—No, in this both preference and ordinary are included.

2987. (*Capt. Galton.*) Is not the proportion about 6,000,000*l.* or 7,000,000*l.* of loans, 10,000,000*l.* of preference shares, and 14,000,000*l.* ordinary shares?—Yes, I believe it is.

2988. (*Chairman.*) 40,000,000*l.* is the total capital?—Yes. There might be a difficulty in the purchase of the preference shares, but even should this stock be purchased at par, there would still be the difference between 5 per cent. paid by the companies, and 3½ per cent. to be paid by the Government; the same may be said of the debenture stock.

2989. (*Mr. Horsfall.*) Have the preference shareholders their maximum dividend?—Generally, I believe they have, but preference shareholders on the different lines are differently circumstanced; in some cases their stock is redeemable, in others they receive some more and some less than five per cent.

2990. Upon the preference shares?—Yes.

2991. Then there would be no objection to allowing those preference shares to remain in the hands of shareholders, the Government buying up the others?—It would be objectionable, as the Government would have to pay a dividend of five per cent. when, by purchasing them, they would only cost 3½ per cent.

2992. (*Sir R. Hill.*) Would not your preference shareholders be willing to submit to some reduction?—I think that the preference shareholders generally, would accept a 3½ per cent. stock for a five per cent. dividend.

2993. (*Mr. Glyn.*) Except the reduction of rates?—Yes.

2994. Do you feel quite certain of that, because in point of fact, by the Government taking the ordinary stock of the railway into their hands, the preference shareholders' position is very much improved?—Undoubtedly.

2995. Why should I give up my five per cent. if I have it in perpetuity?—In my opinion the purchase, by Government, of the railways in Ireland would be most popular. On the part of some of the directors there might, and probably would, be objections, but not on the part of the shareholders, and certainly not on the part of the public.

2996. (*Sir R. Hill.*) Your lordship does not recommend compulsory powers, I presume?—Not at first. My belief is that the greater part could be bought by negotiation, and in the other cases by compulsory arbitration.

2997. (*Mr. Glyn.*) Would you force the individual to take less than his contract?—I do not anticipate that the thing would be necessary.

2998. (*Mr. Horsfall.*) Has not that principle been adopted with regard to the turnpike trusts in England?—I do not know much of the turnpike trusts of England.

2999. (*Lord Donoughmore.*) When you have put these railways into the possession of the Government what would you do with them?—The Government could not manage railways in any country properly; in this country there would be jobbing to a frightful extent; in my opinion there could be no safety in travelling upon a Government line.

3000. (*Sir R. Hill.*) May I ask what dangers your lordship apprehends?—My recommendation is, that the Government should at once possess themselves of the different railways, now not less than 54 in

number, and that they should lease them to large companies. I would prefer a large English railway company to any other. For my part I should be very glad to see the London and North-western Railway Company work the line between Dublin and Westport, and I believe it would be to the advantage of the North-western Company to do so. I consider that the whole of the 54 Irish railways should be leased to three companies only.

3001. (*Mr. Glyn.*) How would your lordship divide the districts in Ireland ?—I would divide them into the south, the midland, and the north. All the country between Ennis and Cork I would call the south district; between Ennis and Enniskillen should be called the midland district; and from Enniskillen to Belfast the northern district.

3002. (*Chairman.*) Would you forbid all competition where the systems adjoined one another ?—If these lines were let by the Government, they must be let under conditions. One of the conditions would be a maximum fare, and another a minimum accommodation. These objects must be secured; after which I would allow of no competition whatever.

3003. (*Mr. Glyn.*) Then you would amalgamate all the smaller companies into these three large companies ?—I would. Nothing would be more simple, and it could very easily be managed by a board sitting in London, but not in Dublin.

3004. Why do you prefer a board sitting in London ?—A board sitting in Dublin would be too near the Castle.

3005. (*Chairman.*) You would place the companies to whom you propose to lease the lines under the control of a Government board sitting in London ?—Certainly.

3006. Do you contemplate any control to be exercised over the companies, or would you allow them a considerable amount of liberty ?—I would give them as much liberty as possible, after securing from them the conditions of maximum fares and minimum service.

3007. Then you contemplate the interference of the Government board only occasionally ?—Yes.

3008. (*Mr. Glyn.*) Does your lordship think a board sitting in London would have a sufficient acquaintance with the wants of the district to enable it to manage it properly ?—Certainly. Our railway is managed in London. A great many of the Irish boards sit in London.

3009. The London board has the advantage of your lordship's information ?—I should be very far from wishing to exclude Irishmen from the London board, although I should be sorry to see them meet in Dublin. I think a very small board, with the Chancellor of the Exchequer and the President of the Board of Trade as honorary members, would conduct the business with little trouble.

3010. (*Mr. Glyn.*) When did this new annuity system come into operation ?—I cannot say it has come into operation; it has been proposed to us.

3011. Is it to be undertaken by the companies necessarily, or have they any option in connexion with it ?—I really do not know whether it will be obligatory or not.

3012. Is it put to the companies to do so in default of their paying interest, or paying off a certain proportion ?—I have no doubt that Mr. Gladstone thinks that we shall accept it cheerfully, but I see great difficulties. I would rather continue under the old system.

3013. (*Sir R. Hill.*) Have not the loans been made upon the condition that they shall be paid off by instalments in certain periods ?—Yes.

3014. Have those instalments hitherto been regularly paid ?—No, I believe not regularly.

3015. I presume then this is a measure adopted in consequence of the nonpayment of the instalments ?—I think it is proposed in order to secure more regularity in the payment of the principal monies.

3016. (*Mr. Glyn.*) I understand that the loans were made by the commissioners upon debentures ?—Yes.

3017. Had those debentures a certain fixed time to run ?—Our debenture capital was taken by the Government under a mortgage of the line, and on condition that the principal money should be repaid by annual instalments within 20 years; as yet we have not been enabled to pay off any of the instalments which have become due. In the English market it is nearly impossible to raise money upon Irish railway securities.

3018. (*Chairman.*) Do you contemplate that any loss which might accrue, either temporarily or permanently, may be borne by the country at large ?—My idea is, that at the end of four or five years, or perhaps less, there would be no loss from the reduced rates and fares. I recommend, what loss should occur in the receipts in the meantime, should be added to the amount paid in the purchase of the railways.

3019. (*Mr. Glyn.*) Do you think that the company should have the power to raise the capital ?—No, I have one plan and no other, and that is, that the Government should possess themselves of the railways.

3020. Who is to raise the capital out of which the deficit is to be paid ?—Assuredly the Government. If, at the end of say five years the traffic did not increase to the extent expected it would be for the Government to increase the fares, but in my opinion the receipts would more than recover themselves. I consider that the Government should neither lose nor benefit by the railways in Ireland. These should pay 3½ per cent. for the Government monies, and the fares and rates should be regulated accordingly.

3021. Then you would have the deficit raised by a Government loan of 3½ per cent., in fact ?—Yes, I would.

3022. (*Chairman.*) Have you considered whether it is probable that companies could be found willing to lease the lines from the Government ?—I am very much inclined to think that English companies would take them. I do not believe there would be the smallest difficulty in finding companies to work Irish lines.

3023. Have you considered how additional lines are to be made, supposing the existing lines to fall into the hands of the Government ?—I think there would be very few additional lines required. The Government, in my opinion, should only construct new lines where the counties agree to give the land, and where a certain amount of local subscription is offered. These lines would be chiefly single lines, and would seldom cost more than 4,000*l.* per mile.

3024. (*Lord Donoughmore.*) That is not including the land ?—Yes, our land throughout has cost between six and seven hundred pounds per mile; for one part of our line the contractors received for the land 700*l.* per mile, in addition to what they were paid for the works. The total cost of our railway will amount to something like 6,580*l.* per mile.

3025. (*Sir R. Hill.*) Is it a single or double line ?—A single line with double over works.

3026. (*Chairman.*) Is that through a heavy country, either many cuttings or embankments ?—It is a flat, easy country. It might have been done even cheaper.

3027. If you had ready money it might be done cheaper ?—If we had had ready money, I am perfectly certain the line need not have cost more than 3,500*l.* per mile. With Government credit we should have saved 1,000*l.* per mile and more. It was proposed that 6,000*l.* per mile should include all expenses, but monies were wasted upon stations, and above 20,000*l.* lost in parliamentary contests.

3028. (*Chairman.*) What would you do with the lines which are now actually in process of construction, or those for which Acts have been obtained, although no works have been commenced upon them ? All the lines authorized by Parliament, whether in process of construction or not, should be completed on the earliest day, and were Government credit to be given, there would be a great saving in the cost.

3029. Would you force the Government to complete those lines ?—Undoubtedly the lines must be

The Right Hon. the Earl of Lucan.

19th May 1865.

completed by the company or by the Government. It would save great expense, and therefore be greatly to the interests of the public, to substitute the credit of the Government for the credit of the companies; of course, under proper control and supervision.

3030. (*Lord Donoughmore.*) Are there many new lines proposed in the present session?—Not in my district, nor in the district of the Midland Company. The great object in Ireland is to reach the English market at the smallest cost; the Germans and Dutch send their cattle at a much less cost than we can. Should the rates be lowered to the extent I propose, a beast from the most distant western point of Ireland would reach the London market for 1*l.* 1*s.*, and a fat sheep for 4*s.* or 4*s.* 6*d.* The London and North-western Railway Company now bring beasts at 17*s.* 6*d.* per head, and sheep at 3*s.* 3*d.* from Dublin to London.

3031. Are the rates that you have mentioned between Dublin and London very much lower than the rates charged on Irish railways?—Much lower. The distance between Dublin and London is about 330 miles, whilst between Dublin and Castlebar the distance is only 150 miles. To send a sheep the 330 miles only costs 3*s.* 3*d.*, while to send it the shorter distance costs 2*s.* 3*d.*

3032. (*Mr. Horsfall.*) Your lordship spoke of the grain round Castlebar being shipped by sea from Westport?—From Westport and Ballina.

3033. Have you entered into any calculation as to what reduction would be necessary to enable the railway to compete with the shipment by sea?—We compete already. I am quite satisfied that if we could send heavy goods at $\frac{1}{2}d.$ per ton per mile, we could compete very successfully with the boats.

3034. (*Mr. Glyn.*) Is there a coal trade?—There was undoubtedly a coal trade one year in the west of Ireland; this was purely accidental, and arose from the people having failed, from a constant wet, to save their turf. It had, I believe, never happened before, certainly not to the same extent. In my opinion there never can be a permanent coal trade with the west of Ireland, and for the simple reason that, carry the coal at any price you like, or for nothing, still turf will always be the cheapest fuel. To show this, I must observe that I have two steam engines, one in Middlesex of 8-horse power, a second at Castlebar of 13-horse power; the Middlesex engine, at 20*s.* per ton for coals, costs me 10*s.* per day of 12 hours; the larger engine of 13-horse power at Castlebar consumes two cribs of turf only, at a cost of 4*s.* per day. It may therefore be said that the difference between the cost of turf and coal is not less than 4 against 16. Under these circumstances it will, I think, be the opinion of the Commission that to expect to introduce a coal trade with the west of Ireland would be irrational.

3035. (*Chairman.*) Then it is the difference between 4*s.* and 16*s.*?—Yes.

3036. (*Capt. Galton.*) Do they burn turf in the locomotive engines on railways?—I think not.

3037. Why not?—I do not know.

3038. (*Mr. Glyn.*) You have no back freight for these coal trucks?—At low rates there should be no difficulty.

3039. (*Chairman.*) Is the increase in the coal traffic the principal source from which you consider the increased traffic would come on to your line?—At $\frac{1}{2}d.$ per ton per mile, or 3*d.* per mile for a truck, a large quantity of corn and potatoes would be sent by rail. The traffic in heavy goods would be enormously increased, more than doubled.

3040. (*Capt. Galton.*) As your lordship entertains such a confident opinion that a large increase of traffic would follow a reduction of the rates, I wish to ask why has not that experiment been tried upon one article or two articles at a time, so as to see whether there was any increase?—Our rates could not be lowered advantageously without the Midland Company lowering their rates to the same extent, and I am certain that they would not consent to reduce their rates to enable us to try experiments.

3041. One of your difficulties is being a separate company from the Midland Company?—We are two perfectly independent companies.

3042. (*Mr. Glyn.*) Are the rates for goods upon the Midland very high?—They are exactly the same as ours. We have always allowed the managers of the Midland to levy the same rates upon ours as they do upon their own line.

3043. In what description of goods does your lordship think there would be a great increase of traffic, excluding grain and potatoes?—The country produces meat, corn, flax, and roots; in all of these the traffic would greatly increase.

3044. You do not want much back?—At times a large quantity of Indian corn is sent down, and we have received a tolerable income from this traffic; this year oats have been so cheap as to interfere with it.

3045. (*Chairman.*) Where do you get your timber from?—A great deal of that comes direct by sea.

3046. To Westport and Ballina?—Yes.

3047. (*Capt. Galton.*) Does the railway carry much timber from Westport into the interior to the local stations?—I do not think we carry much timber.

3048. But the timber which has to be used by the people living in Roscommon must come either from the west or from Dublin?—It might come by canal from Dublin.

3049. Is there a canal from Dublin?—Yes.

3050. (*Mr. Glyn.*) I presume groceries go from Dublin?—Everything of that sort goes from Dublin or England. We have through rates with the London and North-western Railway Company, therefore we receive a good deal from Liverpool, Manchester, and other places.

3051. (*Chairman.*) It has been stated by one of the former witnesses that he was of opinion, under all circumstances, that store cattle would continue to be driven along the road, from the fact that it gave the drovers an opportunity of disposing of a portion of them on the way. Do you think there is much consideration to be given to that?—Certainly not. I do not believe it at all. I am perfectly certain that at a very low rate, the greater part if not the whole of the store cattle would travel by rail.

3052. (*Mr. Glyn.*) A great deal of it would come to the English feeders?—In the west of Ireland they do not breed many cattle; they come from the south, and are bought as calves; at three or four years old they come to the English market. The whole of the cattle now coming to the west and leaving the west would travel by rail, if the rates were lowered.

3053. (*Lord Donoughmore.*) When your line is open to the sea at Westport and Ballina do you expect you will have any fish traffic?—We should have the whole of the traffic at this moment, if we had a night train.

3054. That is for fresh fish and salmon?—Yes.

3055. Is not that traffic very considerable in amount?—Very considerable.

3056. Is there any sea fishing at Westport?—Yes.

3057. Would a low rate enable you to create a traffic in carrying Westport fish to the Dublin market?—Yes, and to England also.

Mons. C. A. Fassiaux.

M. Charles Albert Fassiaux called in and examined (through an interpreter).

3058. (*Chairman.*) You are Director General of the Posts, Railways, and Telegraphs in Belgium?—Yes.

3059. (*Sir R. Hill.*) You have been kind enough to supply some information through Mr. Frederick Hill which has been printed for the use of the Commission?—Yes. (*See* Appendix M.)

3060. There are a few questions which I will put to you with reference to that statement. You have given the fares charged for the conveyance of passen-

gers, will you allow me to ask whether in Belgium return tickets are issued ?—They do give them, but they are not yet arranged on the English system ; it is only done in an exceptional way.

3061. Have you any trains similar to our excursion trains ?—Yes, there are special excursion trains.

3062. Do you issue tickets resembling our season tickets ?—We issue tickets to encourage people to undertake certain journeys which they otherwise would not take. There are no season tickets. The administration are considering whether it is desirable to issue tickets of this kind, which correspond, I believe, with what are issued on the French railways under the name of " cartes d'abonnement."

3063. Can you state the speed of the express trains, how many kilometres per hour ?—The greatest speed is from 70 to 80 kilometres per hour. The regulated highest speed is about the same as in England. I have made inquiries as to the speed on the railways in England, France, and Germany, and I have endeavoured to regulate the speed upon the railways in Belgium accordingly.

3064. Is the speed of your express trains about equal to the speed of the English express trains ?—Yes, except the Great Western, which has an exceptionally high speed.

3065. I see that the estimated income of the railways is about $6\frac{8}{10}$ per cent. upon the capital expended ?—Yes.

3066. Is that the gross income, or is it the net income, after deducting expenses ?—That is the income, after payment of all expenses, seven per cent. is the last result.

3067. Are we to understand that the State railways in Belgium produce at this time a net profit of seven per cent. upon the capital expended ?—After all the expenses of working are paid there is a net profit of seven per cent.

3068. Has the profit been about seven per cent. for any considerable time ?—No; it has varied from six to seven per cent. for three or four years. If desirable I can give it more particularly.

3069. What was about the rate of profit in the early years of railway management ?—There was no profit at all in the first year. It was said to be a heavy expense on the State.

3070. Did that state of things continue long ?—Perhaps 10 years. I am not quite certain about the number of years, but certainly several years, until the Chamber of Deputies came to the conclusion that they must spend more money in order to bring in a profit.

3071. The information which you have been so good as to supply the Commission with shows that your experience has satisfied you of the expediency of the railways belonging to the State ?—Yes.

3072. Are you equally satisfied as to the expediency of their being worked by the State ? — Yes, under certain conditions.

3073. What are those conditions ?—I think the interest of the country demands that the State should be masters of the railways, and should itself work the chief lines, leaving to the companies the branches or feeders. But I would not venture to assert that it is essential so to regulate the mode of working that the administration should be over-burdened with details which might perfectly well be confided to private enterprise; such, for example, as porterage and cartage of goods in the towns. Under these conditions, I am convinced that the system of railways of the most extensive country may be administered as easily as any other public service.

3074. Has the question of leasing, by the State, railways to companies or to individuals, to work them, been under your consideration ?—Yes, proposals have been made to the Belgian Government, but they have been rejected. The proposal was merely to buy the railways of the State and not to lease them.

3075. Is it not the fact that several of the railways in Belgium are worked by companies and belong to companies ?—Yes.

3076. Are they worked as carefully with reference to the convenience and advantage of the public as those which are worked by the State, or less so ?—The public say they are not and that they prefer a management by the State. I think that the management of the State can more readily satisfy general wants.

3077. (*Capt. Galton.*) Has the Government a control over the times of running the trains on private lines ?—Yes, as well as over their charges.

3078. Then there is no competition allowed between the Government lines and the private lines. For instance, in going from Ghent to Mons, there is a line belonging to the Government, and a line belonging to a company, is there any competition allowed between the trains ? — The Government cannot prevent it. As to the charges the agreement settles the maximum rates, and the company cannot go beyond those rates. But the company may charge less, they can run in opposition, and that is the case.

3079. Do you find that it is inconvenient to have railways under different managements?—Yes; there are great difficulties when, if parallel lines, those of the State are conceded to private companies. There is less difficulty when the lines conceded are feeders. This is easily explained when it is considered that the companies have only in view the interests of their shareholders, while the Government care for those of the public. For this reason the Government have recently failed in an attempt, having for its object to equalize the tariff of all the railways. Most of the companies have refused to adhere to the system of rates adopted by the State, because they would not risk a diminution of receipts. It seems demonstrated, at the present time, that uniformity of rate can only be obtained by the State resuming the working of the conceded lines.

3080. Are there any articles which they carry below the cost price, that is, the actual cost of carriage ?—The reductions are not always made with a view to the profit of the exchequer. It happens that the charges are scarcely remunerative, and that they are justified by the duty of the Government to aid in the development of commerce, manufactures, and agriculture.

3081. What articles are they?—Lime, manure, coals under certain circumstances, beet roots, heavy stones, and generally articles of low value.

3082. Do you consider that the prices which they have recently charged in their tariff for these various goods are really remunerative prices ?—I have not had sufficient experience to be able to say. One party maintains that they have gone too far in the reduction, and the other party says that they can go still further. This alteration has been made under very favourable circumstances in Belgium, but I repeat, no opinion can be given till after further experience.

3083. In the arrangements for goods traffic do you convey goods at special rates, or are the rates for the conveyance of goods published and uniformly known to everybody ?—They are always published. There are a few special arrangements which we intend gradually to abandon altogether.

3084. Has the practice of having special arrangements been found to be inconvenient ?—The objections are very great, the principal being the impossibility of making them public, and in consequence the different branches of commerce being unable to compete legitimately. Certain branches of commerce thus obtain an advantage which others have not sought and do not get. The system of having a special rate does bring traffic to the railways, but it is injurious in a public point of view.

3085. Your tariff, I believe, includes a discount to those persons who send larger quantities of goods than a certain fixed amount ?—Yes, when, after inquiry it is proved that a reduction is necessary in order to attract considerable traffic. The special arrangements

Mons. C. A. Fassiaux.

19th May 1865.

for this purpose are now published in the official journals.

3086. (*Sir R. Hill.*) So that there is no danger of favouritism ?—The great objection to the system is the possibility of favouring one to the prejudice of the other, but the precautions taken by the administration seem to be sufficient to prevent abuse.

3087. (*Capt. Galton.*) Did that take place in many cases ? — Never intentionally. There have been, formerly, many complaints from want of publicity; but a remedy has been found, for the most part, to this serious evil, by publishing the special tariffs following the general ones.

3088. (*Mr. Gower.*) Are there such special arrangements upon the private railways ?—Yes, they are not published, but they are subject to the supervision of the minister. I think that the minister would have a right to cause them to be published or not published.

3089. (*Capt. Galton.*) Who loads and unloads the goods at the station ?—That is done by the agents of the administration.

3090. Is that included in the tariff ?—Yes, under the title of accessory charges.

3091. Does the company load and unload coals ?—No. Coals and all other goods *en vrac*, *i.e.*, loaded by means of the shovel, travelling uncovered, are loaded and unloaded by the agents of the sender and receiver respectively. The coal waggons belong to the State.

3092. Does the Government make an extra charge in case of unloading such articles ?—Whenever they have got sufficient *employées* they never refuse to assist in loading or unloading. When such a charge is made it is included in the tariff, under the head of "extra expenses."

3093. (*Sir R. Hill.*) There are extra expenses charged ?—None beyond those indicated in the tariff.

3094. (*Chairman.*) Can you state what dividend the private companies pay upon the average to their shareholders ?—I am unable to answer the question, but I will send the last accounts if they are required.

3095. Do they pay as well as the Government lines ?—No, there is a great difference in favour of the State lines.

3096. Does the Government possess all the most important lines of communication ?—Almost all the great lines. There are, however, true international lines which are worked by companies, especially the line from Namur to Liège, and the Luxembourg line from Brussels to Arlon.

3097. (*Lord Donoughmore.*) When was the existing tariff for goods adopted ?—Not quite a year ago.

3098. Was not that tariff a considerable reduction from the preceding one ?—A very considerable reduction.

3099. Have the results of that reduction been satisfactory ?—Up to the present time they have, but the experience upon the subject is not quite complete.

3100. (*Capt. Galton.*) Was the tariff introduced gradually ?—Yes.

3101. Did they reduce the tariff upon certain classes of goods, or did they make a reduction upon all classes *pro ratâ* ?—It was made first on certain articles. It was feared there might be a very great reduction of the amount received, and therefore it was made gradually.

3102. (*Lord Donoughmore.*) The greater part of the railways which belong to the State run through manufacturing and mining districts, do they not ?—Yes.

3103. Is there any part of the Government system which runs through a purely agricultural country ?—Yes, there is some.

3104. Have you made any comparison between the results of the diminution of tariff in the manufacturing districts and the results of the diminution of the tariff in the agricultural districts ? — No. Such a statement is being prepared, and will be considered when the experience is riper.

3105. Belgium to a great extent is a commercial, manufacturing country ; but supposing Belgium were like Ireland, almost purely agricultural, would you have made the experiment of a reduction in the tariff in Ireland as well as in Belgium ?—Yes, I would still have made the experiment.

3106. Do you think that there are the same elements of success which may be expected from a reduction of the tariff in a purely agricultural country as there are in a mixed country like Belgium, which is partly agricultural and partly commercial ?—Yes, as the object is mainly to induce an increase of goods traffic by charging low rates.

3107. (*Mr. Gower.*) The through goods traffic is very considerable in Belgium, is it not ?—Yes.

3108. (*Sir R. Hill.*) The Commission has before it a "statement laid before the Chamber of Representatives at Brussels, on the 7th of March 1865, concerning the tariff for passengers and luggage on the railways of the State" which statement, you will observe, bears the signature of the Minister of Public Works ?—Yes.

3109. I presume you are cognizant of the facts therein stated ?—Yes.

3110. This statement shows that from 1856 to 1864 considerable reductions were made from time to time in the charges for the conveyance of goods ?—Very considerable.

3111. Will you be so good as to state in general terms what is about the average per-centage of reduction in the rates during the whole period ?—I am not able to say, it varies so much. It was very considerable. The expense for a short distance is as great as for a long distance, and the reduction was made therefore for a long distance. The mean is about 28 per cent.

3112. This led to a very large increase of goods traffic ?—Yes, a very great increase ; about what is stated in the paper, 106·32 per cent.

3113. That is, the quantity conveyed was more than double ?—Yes.

3114. How were the gross receipts affected by this change ?—The receipts continued large in spite of the reduction. The gross total increased, but the expenses increased, therefore the net receipts only slightly increased. The result for the last year was seven per cent. and therefore satisfactory.

3115. Was there any temporary loss in consequence of those reductions ?—No.

3116. The success of this measure has, I believe, led the Government to contemplate a reduction in the passenger fares, has it not ?—Yes ; the Government is anxious to have further experience before acting in the matter. The proposed law is to give the Government a power of reducing the passenger rate.

3117. (*Capt. Galton.*) In England, on certain railways, coal is carried at three-eighths of a penny per ton per mile ; are the rates in Belgium as low as that ?—They are as low as two centimes, and even 1½ centimes per ton per kilometre.

3118. Are those exceptional cases ?—In the cases of the longest distance, as well as for transit and export.

3119. What are the distances ?—About 250 kilometres.

3120. Do they send coal from the Liège basin to Paris ?—They made some experiments, but I do not know the result.

3121. Is the price too high ?—I believe that the difficulty arises solely from the fact that the coal districts of Mons and Charleroi are so much nearer Jerome.

3122. Have you ever heard of the proposal to transport coal from Minden to Paris ?—I have heard of it, but I did not think seriously of it. It would not be more surprising than the transport of cast iron from Belgium to England.

3123. (*Mr. Ayrton.*) Why is that surprising ?—Because iron is produced in England cheaper.

3124. Does the import of cast-iron from Belgium into England arise from any peculiarity in the casting of the Belgian iron, or from any special circumstances ?—I believe it arose from special circumstances.

3125. (*Lord Donoughmore.*) Have you any arrangements for through rates for goods with the Dutch, German, and French railways?—There are working arrangements with all adjoining railways.

3126. Does the Belgian Government find much difficulty in inducing the managers of foreign railways to make a reduction of their rates?—Yes; sometimes they absolutely refuse.

3127. (*Mr. Gower.*) When the reduction was made upon the Belgian railways did it extend to the Austrian and Prussian railways?—No, not in other foreign countries; they have not been inclined to follow Belgium in that.

3128. Take, for instance, the through route from Ostend to Cologne, on what principle is the total rate divided between the Belgian and the Prussian railways—is it a mileage division?—Each administration fixes the kilometric base of the rate which it intends to receive. The total charge payable by the public is made up from this, and it is divided according to a scale, giving the proper amount to each party. The Belgian rates are usually lower than those of neighbouring countries.

3129. (*Sir R. Hill.*) Each charges to and from the frontier?—Yes.

3130. (*Lord Donoughmore.*) Surely merchandise going from Ostend to Cologne would go in the same waggon all the way?—Yes.

3131. There is no discharging of goods at the frontier?—No, there is no transhipment. Every full loaded waggon goes through. Under 2,000 kilogrammes it is transferred to another waggon, above that it goes through on one waggon.

3132. Is the railway which runs from the Belgian frontier to Cologne a private railway or a public railway?—It belongs to a private company.

3133. (*Capt. Galton.*) Where the waggon goes on, is the use of it paid for by the company which takes it on?—A rate is paid for the use of the waggon.

3134. Is that so much per day or per mile?—Two centimes per kilometre.

3135. Is there any demurrage?—There are fixed days for returning the waggon, according to the distance it travels, and if it is not returned in the proper time there is a high fine.

3136. (*Mr. Gower.*) Have the reductions been equally successful upon all the railways, or has there any marked difference in the results of those reductions?—I have already explained that the conceded railways have not yet adopted the rates of the State.

3137. I understood you to say the season has been favourable in consequence of the duration of the winter, will you explain that?—This winter was more favourable for an increase, because in winter the railways take the place of all other means of communication, such as canals and roads. The canals are closed, and the roads are not so easily traversed.

3138. (*Mr. Ayrton.*) In the tariff for passengers it is stated that there is a charge of six centimes per kilometre for 100 kilogrammes of luggage; is there any rebate of the six centimes upon any quantity less than 100 kilogrammes, or do they make no distinction in the charge between one kilogramme and 100?—The tariff is applied counting from 10 to 10 kilogrammes, with a minimum of 50 centimes.

3139. So that if you have five kilogrammes over the allowed quantity of 25 kilogrammes, you have to pay six centimes for a kilometre. For example, if you have 30 kilogrammes you have to pay six centimes per kilometre extra?—Twenty-five kilogrammes are allowed to each traveller, on the condition that he takes his luggage with him, provided there is no inconvenience occasioned to the other travellers.

3140. In this statement it is said that the 25 kilogrammes are in addition to any article placed in the carriage with the passengers; is that correct?—That is not so. Each passenger may take 25 kilogrammes with him upon his own responsibility..

3141. Then if he has five kilogrammes of luggage, which he gives in charge of the Administration, he has to pay six centimes per kilometre for that?—He does pay at that rate, and he cannot pay less than 50 centimes.

3142. (*Capt. Galton.*) If a passenger travels with only five kilogrammes how much would he have to pay?—Six centimes is the basis of the tariff.

3143. (*Mr. Ayrton.*) How is the small quantity paid for if it is less than 100 kilogrammes?—It is assessed by 10 kilogrammes.

3144. Does the working of the lines by the Government afford perfect facilities for the postal service?—Yes, very great.

3145. (*Capt. Galton.*) Do mails go by every train?—Yes.

3146. Are parcels carried by the post office as well as by the railway?—Only by the railway, except what is analogous to our pattern post.

3147. You have not a parcel post?—No; in Prussia they have, but they have not in Belgium, probably we shall have.

3148. Do they give greater facilities for parcels traffic upon the railways?—Yes.

3149. Do they deliver them beyond the stations?—They are delivered to the persons' residences.

3150. Is there any arrangement for collecting them except at railway stations?—There are offices in the towns.

3151. Would parcels be delivered at a distance from the railway station by the Government?—On the average two or three kilometres from the station.

3152. Then that system does not give the advantages to the public which a parcels post gives?—No; it will not give the same advantage, therefore that is why they are now occupying themselves with the question by means of little carts. Before two years are over they will very probably have a system of conveying passengers and parcels, such as specie and articles of value. I attach a high importance to the application of this system, which seems to me to promise to render railways more complete, and to give favourable results.

3153. (*Sir R. Hill.*) The post office has a right to send bags by all trains without paying for that right, has it not?—Yes, it has the right to do that without paying any rate.

3154. Whether the lines belong to the State or not?—Even when the railway does not belong to the State; that is introduced into the original conditions upon which the line is granted.

3155. I need scarcely ask you whether that power is found to be very useful or not in the administration of the post office?—You can form an opinion upon that subject; as you pay companies for the care of the conveyance of the mails, it would be very costly.

3156. (*Chairman*). What is a Belgian league?—Five kilometres. The leagues referred to in that paper are five kilometres. The road league is only four kilometres.

3157. (*Mr. Ayrton.*) How do the Belgian Government pay for the transport of letters upon railways?—It is free.

3158. Upon the railways of all the private companies?—Yes.

3159. (*Lord Donoughmore.*) Suppose the authorities of the post office require to run a train at an exceptional hour, or at an exceptional speed, then would they not have to pay the State or the private companies, as the case might be, for the train?—They pay nothing to the State, but they do to the private companies.

3160. In the *Cahier des Charges* there is a fixed price at which service is rendered?—No, it is not regulated. It would be settled specially at the time.

3161. (*Sir R. Hill.*) Has not the post office a right to send mails by one train per day in each direction, even upon the lines belonging to the private companies?—Yes, they have the right for at least one train per day.

3162. (*Capt. Galton.*) At what price?—Without cost.

3163. (*Lord Donoughmore.*) Are there conditions in the *Cahier des Charges* with the companies with

Mons. C. A. Fassiaux.

19th May 1865.

the view to the transport at reduced prices of soldiers or persons travelling upon Government business?—Only for soldiers, not Government *employés*. All military are conveyed at a reduction of 50 per cent.

3164. Is that when they are travelling upon duty, or when they are travelling for their pleasure as well?—When they are upon service or upon leave.

3165. In what manner do they carry on their works?—The rolling stock and engines belong to the State.

3166. Are the repairs done directly by Government *employés*, or are they in the hands of contractors?—The Government itself. There is a special service organized for keeping up the stock.

3167. Do they manufacture their own locomotives?—No, that is done by private enterprise, but the repair and maintenance are done by the Government. The Government did at one time construct the locomotives, but they have now given it up.

3168. (*Mr. Ayrton.*) Are all the persons employed on railways precisely upon the same footing as regards their position with reference to their salaries and pensions as other persons in the civil service?—They are on the same footing in all ways as in other departments of the Government.

3169. Is there any rule by which the best and most qualified persons are selected from the applicants for situations?—They call for candidates in the *Moniteur*, which is the Government paper, and which gives the conditions upon which they may obtain the appointments. They issue a sort of syllabus of the knowledge required of the candidates, who are examined before a committee.

3170. Are they appointed on the report of the committee as to whom is the best qualified applicant?—They receive the appointment according to their success in the examination.

3171. (*Capt. Galton.*) How are the higher ranks filled up?—They are first supernumeraries; but when they have proved to be exceptionally clever, and can be immediately of great use, they receive a salary.

3172. (*Mr. Ayrton.*) Is the railway administration divided into distinct departments with a chief at the head of each?—There is a director-general, and there are divisions with heads.

3173. What are the divisions?—There are three principal divisions—the locomotive, the permanent way and works, and the traffic department, and there two additional divisions for the accountants' department, and one for general matters.

3174. Is there a chief for the accounts responsible directly to the director-general?—There is one special department of accounts.

3175. Is that independent of the director-general, or is it under the director-general?—No, under the director-general. There is a department for the supply of stores.

3176. Are the salaries which have to be paid to these officers regulated upon precisely the same scale which is paid in the other departments of the State, such as the Comptroller General of the Ordnance and the Accountant General of the Army?—Yes, exactly the same as all other Government departments. They have the same right to pensions and at the same rates as other Government departments.

3177. (*Mr. Gower.*) Has the Government bought any of the private railways?—One railway has been bought, the promoters being desirous of transferring it to the Government on payment of an annual amount.

3178. Upon what principle was the amount fixed?—Upon an estimate of the value of the railway and the importance of the traffic.

3179. Not of the value of the shares at the moment?—No, not with reference to the value of the shares.

3180. There are several railways being constructed now, are there not?—Yes.

3181. Are those all private railways?—They are both Government and private. There is one from Brussels to Louvain being constructed on account of the Government. Others are being constructed by private companies, but they will be managed by the Government. From Braine-le-comte to Ghent there is a railway being constructed by a private company which will be managed by the Government on payment of 50 per cent. of the receipts. They have found it to be a good system to allow the railway to be constructed by a private company and afterwards transferred to the Government.

Adjourned till Wednesday next at 12 o'clock.

Wednesday, 24th May 1865.

PRESENT:

The Right Hon. Lord Stanley, M.P., F.R.S.	Geo. Carr Glyn, Esq., M.P.
The Hon. E. F. Leveson Gower, M.P.	A. S. Ayrton, Esq., M.P.
The Right Hon. Robert Lowe, M.P.	Capt. Douglas Galton, R.E., F.R.S.
Sir Rowland Hill, K.C.B., F.R.S.	E. T. Hamilton, Esq.
T. B. Horsfall, Esq., M.P.	William Pole, F.R.S., *Secretary.*
Robert Dalglish, Esq., M.P.	

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S., in the Chair.

Mr. Thomas F. Brady examined.

Mr. T. F. Brady.

24th May 1865.

3182. (*Chairman.*) You are secretary to the Special Commission on Irish Fisheries?—Yes.

3183. And you have been inspector of fisheries in Ireland?—Yes.

3184. In the discharge of the duties of your office have you had occasion to become intimately acquainted with the state of the Irish fisheries, both in the fresh water and in the sea?—Yes.

3185. Is there any great extent of the Irish coast which, in your opinion, is well adapted for carrying on sea fisheries?—There is a very large extent.

3186. Will you adduce any particular parts of the coast that you consider the best?—All the west coast—in fact from the south-west coast from Dunmore round by Galway, Westport, Sligo, Donegal, and round to Moville—all that coast abounds in cod, ling, and flat fish, the finest turbots, soles, brit—the very finest classes of fish that can be taken; the largest turbots are to be found in large quantities round that west coast.

3187. Is the number of the population employed in the fisheries increasing or diminishing?—Decreasing.

3188. Since what time has that decrease taken place?—Since 1844, so far as the Board of Works, who are charged with the administration of the laws relating to the Irish Sea fisheries, has received returns from the coast guard, the coast guard of the country being specially charged with the revision and registry of the fishing vessels, and the number of men and boats employed. I can give you the number of men and boats employed on the Irish fisheries during the last year.

3189. The extension of railways in Ireland has not led to any increase in the produce of the Irish fisheries?—It has not.

3190. In fact, the extension of railways has been simultaneous with the decrease in the produce of the

Irish fisheries ?—It has. The extension of railways has removed a great deal of the ordinary conveyances of the country away. The fishermen used to send the fish by carts and cars and the general modes of conveyance, before the establishment of railways, through the interior of the country ; the population of the whole country has very much decreased, and those conveyances are removed. The railways have not given those facilities of transit that would induce the fishermen, I think, to follow their occupation with diligence.

3191. Which was the chief market for fish taken on the west coast of Ireland ?—Before the extension of railways it was in the interior ; we had no central markets. Galway sold its own fish in Galway, and in the interior of the country, carried by hawkers or jolters. Since the extension of railways, the Galway fish, principally the finer portions of the fish, come to Dublin, and from thence to London, Liverpool, Birmingham, Manchester, and all the principal towns in England.

3192. Has there been a falling off in the demand in Ireland itself for this fish ?—I think in the seaport towns there is a falling off in consequence of the population falling off ; the English markets being now so near us and so quickly reached, it takes a great quantity of fish away that would otherwise be consumed in the country. Fish has reached an enormous price in Dublin and in other places in Ireland.

3193. Is the supply in Dublin unequal to the demand ?—Quite unequal to the demand.

3194. Where is Dublin chiefly supplied from ?—It is chiefly supplied from Galway, from the east coast, and some portions of fish come from Castlebar, and from Waterford, Kinsale, and Dunmore also. There is a very large fleet of trawlers engaged in the fisheries on the east coast that trawl the Kish bank and the Nymph bank, and on down to Dunmore—these bring in a great quantity of fish to the Dublin market, and it is sent then on to the different English towns.

3195. Are you of opinion that the rates of carriage for fish on the Irish railways tends to depress that branch of industry ?—I think that the rates of carriage on fish, particularly on small parcels, tend very much to depress it. Fishermen, unless they can get the means of sending away small parcels of fish, each man sending his parcel to a factor in Dublin, must sell it to some hawker or others, who send it away, and the consequence is that the hawker is the man who gets the profit, and the fisherman gets very little for his trouble.

3196. Although the rates on the railways are high, there must be greater facilities for getting the fish away now than before the construction of the railways ?—No doubt.

3197. Then how do you account for the produce of that branch of industry having fallen off ?—The railways are taking the fish now away from the seaport towns where the fish are caught, and before it used to be brought into the interior of the country ; they had probably a greater market, and although not as profitable as now, there was a greater demand than there is at present.

3198. (*Lord Stanley.*) Is not the main cause of the decrease this, that the local demand is much smaller than it was, consequent upon a diminution of the population ?—Yes, quite so ; it is much smaller in consequence of the decrease in the population.

3199. Setting that local demand aside, do you think that there is any decrease either in the demand or the supply ?—I do not think there is any decrease in the demand ; it would be hard to say whether there is a decrease in the supply ; there is a decrease in the number of men and boats to a large extent, but whether there is a decrease in the supply I cannot tell.

3200. Is that decrease in the number of boats and men employed more than may be fairly accounted for by the diminution of the local demand, consequent upon emigration ?—I think not; probably the decrease is just in proportion to the decrease in the population. At the same time I think that if railways afforded greater facilities you would give greater encouragement to the coast population to fish ; for now they will take any ordinary employment rather than follow that very precarious one of fishing, unless they have good markets and facilities.

3201. Who are the persons who buy the fish from these fishermen ?—They are called jolters in the country ; they are hawkers.

3202. Do they buy large quantities of fish and send it in large quantities to Dublin ?—Yes ; they buy them in large quantities in Galway ; they watch the boats coming in, and then they buy each vessel's load as it comes in, and send the fish away themselves.

3203. (*Mr. Ayrton.*) You stated that the price of fish had risen ?—Very much.

3204. And that it was in consequence of the demand for fish for the English market ?—I think that that has been a good deal the cause of it.

3205. Is the fish sent to the English market round by sea from the west coast, or is it sent by railway ?—Salmon is sent from Ballina. What I have been speaking about has been the coarse fish, turbot and soles, wishing to distinguish them from salmon. From Ballina they send the salmon round the whole of the north coast in sailing smacks to Liverpool, in preference to sending them by railway from Castlebar.

3206. That is all the salmon ?—Yes ; they pack them in boxes with ice. They send them round a very long distance from Ballina, round the north coast of Ireland, on to Liverpool, in preference to sending them from Castlebar by railway.

3207. What has the rise in the price been in any given period ?—Salmon is now worth 1*s.* 3*d.* or 1*s.* 4*d.* a pound in the wholesale market.

3208. In what market ?—In either the Dublin or the English markets. There is very little difference between them at present.

3209. What is the price of the salmon at the place where it is caught and from which it is sent ?—That is about the price, because wherever you have salmon fisheries the fish all comes to the Dublin or English markets, and the prices are regulated by the Dublin or the London market. The price I have given is the price to the person capturing the fish.

3210. What was the former price at any given period ?—Salmon was down very low at one time, as low as 3½*d.* and 4*d.* a pound before facilities were afforded by railways, and they could get ice.

3211. Do you mean that the wholesale price was 4*d.* a pound ?—Yes.

3212. At what time was that ?—I think I bought it in the Dublin market for 4*d.* a pound probably 15 or 16 years or 20 years ago.

3213. I do not understand why the price of salmon should rise in the Liverpool market in consequence of railway facilities being afforded ?—The English markets take so much salmon now, and it is so easy to get at it, that I think it must rise in price.

3214. You mean that it is distributed from Liverpool into the interior of England to such an extent, and the demand in Liverpool has so greatly increased, that there is no corresponding rise in the price in Liverpool ?—Yes.

3215. With regard to the coarse fish, has there been any rise in price in that ?—There has been a great rise in the price of coarse fish—turbot, soles, and cod.

3216. Has there been a corresponding rise in price at the places where they are caught in Galway and all along the coast ?—There must be, to a certain extent, a rise in the price, but the poor fisherman is not the man who reaps the advantages of it.

3217. Can you state what the present price is, and what the former price was of the fish to the fisherman at the great fishing places on the west coast of Ireland ?—I will take turbot, which is worth at the present time from 10*s.* to 1*l.* a piece, while formerly it could be bought at the fishing places for 2*s.* 6*d.*

3218. What is the price at the fishing places now, in Galway ?—I cannot state exactly what the fish

Mr. T. F. Brady.

24th May 1865.

sells for, but I will give the Commission an instance which occurred on the north coast. At one time in Belfast Lough I saw cod fish sold at the rate of 2*s.* 6*d.* for 13 fish. The fishermen themselves had no means of sending them to market on their own account, and they had to sell them to hawkers who sold them again, and then they were sent on. These people had facilities for sending them on to the markets, and they reaped the advantages of the high price, but the fishermen did not reap it.

3219. To what period are you now referring?—Five or six years ago.

3220. At the present time do the same class of people get the fish more freely?—I do not think they do.

3221. Has there been little or no change in the price paid for the fish to the fishermen?—Not much as to the coarse fish in the price paid to the fishermen. I speak of the distant stations; of course the fishermen who fish on the east coast bring their fish in their own smacks to Dublin, and there they have reaped advantages from the high price.

3222. Do you think that the intermediate agents have got the full benefit of the rise in prices?—I think they have.

3223. (*Mr. Glyn.*) You have stated that the fishermen wanted an opportunity to send small parcels of fish, and that facilities should be given to the fishermen on the coast, but what quantity do you mean by small parcels of fish, what weight?—Less than one hundredweight of fish. I think that each fisherman ought to have facilities afforded him for sending his own parcel of fish to his factor in Dublin; then he would get his money direct the next day to himself.

3224. What is the present charge by railway?—I have made out a return of the different charges made since 1852 down to the present year on different lines of railways.

3225. From what places have you taken them?—I have taken all the railways—from Cork, the Great Southern and Western, the Waterford and Limerick, the Galway line, the line from Castlebar joining Ballina, the Dublin and Drogheda line, and lately only the Dublin and Waterford line; we have had no returns until last year from the Dublin and Waterford line. These returns are culled from the different reports of the Commissioners made to Parliament.

3226. What is the rate upon the Great Midland Railway?—I should say that on comparing the prices charged in the different years from 1852, the rates vary so much that I cannot ascertain upon what data they make these charges at all. For salmon under 10 cwt. the charge was 3*s.* 6*d.* per cwt. in 1852, and over 10 cwt. it was 2*s.* 6*d.*, from Galway, the distance being 126 miles. In 1864 they charged 31*s.* a ton from Galway; they charged 39*s.* 9*d.* from Castlebar, and they charged 24*s.* 6*d.* a ton from Sligo, the distance being 134 miles, while they charged 34*s.* from Collooney, a distance of 128 miles, six miles less than the previous distance I gave, and the charge being 10*s.* a ton higher on the same line of railway. From Ballysadare they charged 34*s.* 6*d.*, the distance being two miles more.

3227. What is the minimum quantity that is carried?—Under 5 cwt. I am now speaking of the Midland line.

3228. (*Mr. Horsfall.*) Can you at all account for these unequal rates?—I cannot. I have examined this return prepared from the different reports made by the Commissioners to Parliament. I have examined it most carefully, in order to ascertain why these charges could be made, and I cannot understand at all on what principle it is that they carry fish on the same line of railway for a much greater distance at a much less charge.

3229. Has any representation been made to the railway companies as to these unequal rates?—Yes, and the Commissioners of Fisheries have remarked upon it in their various reports to Parliament that they have had frequent interviews with the directors of the two great lines of railway, but that they had not effected any alteration.

3230. (*Mr. Glyn.*) Does the rate charged on the Great Southern and Western Railway differ very much from the rate charged on the Midland Railway?—The Great Southern and Western rate does vary very much from it.

3231. (*Mr. Ayrton.*) You have spoken of an intermediate person being able to buy up the fish at a price of 3*s.*, and selling it at 6*s.*?—Yes.

3232. For how many pounds of fish do they give 3*s.*?—They send it away in bulk, and then they can send it by cheap carriage at so much per ton; they give different rates, that is, under 5 cwt. so much, and over 5 cwt. so much less.

3233. The railway charge for conveying fish the whole length of the Midland Railway comes to something under a farthing a pound?—Yes.

3234. It is a fifth of a penny?—Yes.

3235. Will you be good enough to explain how the charge of a fifth of a penny could influence the trade where the difference in price is such as you have mentioned?—A farthing a pound is considered to be a great difference when you deal with fish in any large quantities.

3236. Will you compare that with the different prices you have mentioned, for I want to know how this infinitesimal sum could influence the trade in any way?—I am really not prepared to answer that question.

3237. (*Sir R. Hill.*) You have spoken of the profits of the middlemen as being something enormous?—Yes.

3238. Have they any monopoly given to them?—No; except in the way I state there is no monopoly. These poor fishermen are obliged to sell, and it is the general complaint there, of these people.

3239. What obliges them to do so?—It is because they cannot send their own parcels to a factor. If they have only a small parcel of fish the rates are so excessively high that they cannot do it. The returns that I gave you were for a weight over 5 cwt., but the parcel rates are considerably higher.

3240. What would the rate for a single hundredweight be?—I can give you an instance. On the Midland Great Western Railway, one-eighth of the distance, 65 lbs. of salmon cost 5*s.* 10*d.* coming to Dublin from Castlebar.

3241. That would be a little more than a penny per pound?—Yes. From Cork, a distance of 15 miles further, by the Great Southern and Western it would only cost 3*s.*

3242. What was there to prevent those fishermen sending their fish to Dublin and paying a penny per pound, two or three of them joining together to make up the hundredweight?—In practice they have not done it.

3243. But why do they not do it?—I cannot explain that further than by saying that they do not do it.

3244. Can you conceive any possible change as to the charges on railways which would induce them to do it?—I think if the parcel rates were low per hundredweight they might do it.

3245. I understood you to say that the fish is sold to the middlemen; at what price?—I cannot tell you that. The fish may vary in price from 2*d.* to 8*d.* and 1*s.* a pound, but some coarse fish is not worth more than 2*d.* a pound. Hake is not worth more than a penny a pound when the hake fishing sets in.

3246. You stated, as I understood you, that the fishermen sell their fish at a low price to the middlemen, and that the middlemen send the fish to Dublin, and there get a very high price for it?—Yes, that is, a price considerably greater than the working fishermen get.

3247. I do not see how that state of things, which to me is very inexplicable, is to be remedied by any practical lowering of the price charged for the conveyance of the fish from the place where it is caught to Dublin?—There is a great difference between the

parcel rates and the rate per hundredweight or five hundredweight.

3248. The parcel rate is very high, you say ?—On salmon it is, but salmon will bear it, because it is a very valuable high-priced commodity, but coarse fish is not able to bear that high rate. Fish that is sold at a penny a pound cannot bear a halfpenny a pound for carriage, or a farthing a pound.

3249. Is the price of coarse fish at the ports so low as a penny per pound ?—Hake is sold at less than a penny per pound.

3250. What is the price of soles ?—At certain seasons soles are worth more.

3251. Just give us an average ?—I cannot give you an average of the prices of the different kinds of fish, because that depends upon the description of fish, the quality and quantity.

3252. Cannot you give us some idea of the ordinary price of fish ?—Turbot is worth from 6*d.* to 8*d.* per pound, retail, in the Dublin market.

3253. I am speaking of the price of turbot where it is caught, and the price which the fisherman obtains from the middleman ?—The fisherman does not sell it by weight at all, he sells it merely by bulk.

3254. Cannot you convert the price by bulk into a price by weight ?—I cannot.

3255. Give it then in any shape that you can ?—A fisherman sells perhaps about a dozen turbots to a hawker, and he may not get more than 1*s.* apiece for them.

3256. Then supposing the turbots are sent to Dublin, what are they sold there for ?—They may be sold in Dublin for 6*s.* apiece.

3257. That is a state of things which appears to me utterly inexplicable, that a turbot bought at one end of a line of railway for 1*s.*, should be then carried for a penny a pound to the Dublin market, and be there sold for 6*s.*?—That is so.

3258. (*Chairman.*) Are the middlemen, under this system, making very large profits ?—In many cases they have done so.

3259. (*Sir R. Hill.*) Are there a great many of these middlemen ?—Yes.

3260. (*Mr. Ayrton.*) What is the nature of the fish markets at the places where the fish are caught ?—There are no markets at the different places. The fish are brought on to the beach and stranded, and a man comes and buys them in bulk; there is no market.

3261. And the fish are sold on the strand as they are on the English coast ?—I suppose so.

3262. Are there no competitors on the strand to buy the fish ?—In some places there are; on the east coast there are competitors.

3263. Do you think it is according to the usual course of business for fishermen to send their fish on their own account to distant markets ?—I think if they were able to send their fish they would of course do away with the profit which is now obtained by the middlemen.

3264. Is it the custom with people of that class to send their goods to distant markets, consisting only of small quantities at the place of production, or do they usually sell them to some agent ?—They usually sell them to some agent.

3265. (*Mr. Horsfall.*) Is not the system the same as that which prevails in England ?—I believe so; but I do not know what the system in England is.

3266. (*Capt. Galton.*) You seem rather to think that the fisherman should send his fish to the Dublin market; but I do not gather from you that he is at all precluded from doing so by the high price charged for carriage. You say that he gets 1*s.* for a turbot on the sea coast, which turbot is sold for 6*s.* in the Dublin market, the cost of carriage being a penny per pound. The turbot does not weigh, I suppose, more than 12 lbs.; therefore if the fisherman charged the Dublin fishmonger 3*s.* and paid the carriage, the Dublin fishmonger would gain 2*s.* ?—Yes, he would.

3267. Therefore it does not appear that the railway carriage in any way precludes him from sending the fish to the Dublin market ?—As you put it to me now, I do not think it does really.

3268. (*Mr. Ayrton.*) What we desire to understand is, whether he is precluded by the railway rate, or by those social and trading circumstances which affect the conduct of business of this sort ?—I think it is affected probably in both ways; it is affected not only by the railways, but also by the social circumstances of the case.

3269. (*Mr. Hamilton.*) Do you suppose that there is a considerable part of the fish sold by the fisherman to the middleman which spoils before the middleman can get it to market ?—I cannot say; but if they have not got a train by which they can send the fish off to Dublin or to markets at certain times, particularly in such weather as the present, a great quantity of it must spoil. At Castlebar, for instance, there is no train from 11 o'clock in the day, so that all the western fish that is brought in fresh caught must remain over until the following day.

3270. (*Capt. Galton.*) You mean that there is only one train a day from Castlebar ?—Yes.

3271. (*Mr. Hamilton.*) If the fish became spoiled, the profit to the middleman would be materially reduced ?—Yes.

3272. (*Sir R. Hill.*) I understood you to say that you thought the fishermen were, in some way, injured by the establishment of railways ?—I do not think that the railways have benefited the fisheries as it was originally contemplated they would do.

3273. It would seem that from Castlebar the railway does not carry the fish after a certain hour of the day ?—The railway carries the fish, but not at convenient times.

3274. What is there to prevent the fisherman from resorting to the old means of conveyance by cars ?—All those conveyances have been taken off the road by the introduction of railways.

3275. (*Mr. Ayrton.*) Allowing for the delay which may take place in consequence of the trains not running at convenient times, does not the fish nevertheless arrive sooner in the market than it did when they were sent by cars ? — They were not then brought such distances by cars as they are now by the railways, the fish then was only taken to the markets in the interior, and not to the great markets; it did not get to England.

3276. (*Capt. Galton.*) Is it not the fact that the fisheries on the western coast of Ireland have been much injured by a system like trades unions, and the boats and nets have been destroyed ?—No instance of that kind has occurred on the west coast, except at Galway. The Claddagh people have been very violent and opposed to the introduction of new modes of fishing, such as trawling in the bay, and they have destroyed the nets on various occasions, and attempts have been made to scuttle the boats.

3277. (*Mr. Ayrton.*) Was there not a fishing company established at Galway which came into direct relation with the fishermen, and which gave them the benefit of a rise in the prices ?—There was a London company.

3278. Did not that company provide every requisite for the most scientific and most economical modes of fishing ?—Yes, for scientific modes, but that company was carried out in a way that was calculated to fail; it was carried out in such an expensive way that it could not succeed.

3279. Having done so much, it failed ?—Yes; it broke down from mismanagement.

3280. Did it not find great difficulty in carrying on its business from the obstructions offered to it by the people there ?—Never.

3281. Was it well supported by the fishermen there ?—I have not the slightest doubt of it. I have not the least doubt that if a company were started, well conducted, and which acted with economy, they would meet with every support all round the west coast, and, indeed, all round the coast of Ireland. There may be

Mr. T. F. Brady.

24th May 1865.

prejudices existing among the people in Galway, but that is the only place that I know of where there are any.

3282. When the company I have referred to broke down, did any private enterprise spring up; were there parties ready to carry out the same operations?—Yes, there are parties fishing there, but I am sorry to say that there is very little private enterprise in Ireland with respect to fishing.

3283. (*Sir R. Hill.*) Is not that the root of all the evil?—It is the root of a great deal of difficulty in Ireland—the want of private enterprise.

3284. (*Chairman.*) Did the company which has been mentioned meet with any obstruction from the railway companies in making arrangements for the conveyance of the fish?—I think not. That company was established at Galway, and the direct Galway line had trucks to carry the fish at 12 o'clock at night by the mail train, and they afforded great facilities. If the same facilities were afforded from Castlebar and Sligo there would be a very different state of things.

3285. Do you think, as far as Galway is concerned, that the railway company affords every facility that they could be expected to do?—Yes, I think they afford every facility.

3286. Is the trade to any great extent carried on between Galway and Dublin?—I can give you the quantities of fish that were carried by the Galway line from 1852. In that year there were 523 tons of fish carried.

3287. (*Sir R. Hill.*) No more than that in a year?—No, that was all, including oysters, cured fish, eels, cod, and salmon. In 1862 they only carried 785 tons.

3288. (*Mr. Glyn.*) What quantity did they carry last year?—Last year they carried 1,136 tons.

3289. Is the quantity increasing?—It was just increased for that one year; but if you take the returns altogether you will find that the quantity has increased very little.

3290. (*Chairman.*) Is that the most important fish trade that is carried on on any Irish railway?—The Great Southern and Western Railway carry on a very important salmon trade, and in other fish also. They carried 1,249 tons of fish last year, and 1,145 tons the year before.

3291. (*Mr. Glyn.*) Where was it brought from?—From Cork; it is collected from Cork, Limerick, and Waterford, and on all the Southern Lines. The herring fishing now on the east coast is a very profitable one. They sold last year alone, on the quay of Howth, 94,000*l.* worth, and upwards, the produce of 110 days fishing.

3292. Have you reason to believe that any reduction in the charges by railway would materially increase the quantity of fish sent from Galway?—From Galway, I think not; but from stations such as Sligo and Ballina, to which railways are not extended, they have to bring the fish 16 or 18 miles by cart first, and of course you have to add the additional expense of the carting from the fishery to the railway station, and then to add the railway charge to that.

3293. Would it pay the railway companies to afford additional facilities to Ballina and Castlebar?—I think it ought to pay them if it has paid the Galway Company to do so.

3294. (*Mr. Ayrton.*) Would it not be cheaper to employ small steamers to bring the fish up from Sligo?—They send all the salmon from Ballina all round the north coast by sailing smacks in preference to sending it by railway. All that traffic is lost to the railways because they can send them for about 4*s.* 6*d.* a cwt. round by sailing smacks, and they run all the risks rather than send them by railway in consequence of the expense.

3295. (*Capt. Galton.*) How long does it take to go round by the sailing smacks?—It depends, of course, upon the weather; but they do it now in 48 hours to Liverpool.

3296. Do you mean 4*s.* 6*d.* a cwt.?—Yes, or 4*l.* 10*s.* per ton.

3297. (*Chairman.*) Have any communications taken place between the Irish Fishery Commissioners and the Directors of the Irish railways?—They have had interviews, there have been no written communications, and the Commissioners have reported upon the subject. I can refer to the reports made by the Commissioners, which I have brought with me, and can, if I may be allowed to do so, read extracts from them.

3298. (*Mr. Ayrton.*) Do you think that the fish is conveyed in sailing smacks rather than by railway on account of the greater expense, or because the fish are better preserved in sailing boat than on a railway?—They are not better preserved in a boat than on a railway.

3299. There is no advantage in the boat in that respect?—No; on the contrary I have heard from the largest proprietor of salmon fisheries on the west coast—I refer to the Ballina fishery—that he would prefer sending the fish by railway if he could; but he does not send parcels of fish by railway when he has small parcels to send; they have to cart it 16 miles into Castlebar. They would rather cart the fish from Ballina into Castlebar and send it by train to Dublin, and thence to Liverpool and the English markets, than send it, running the chance of bad weather, round by the coast.

3300. What is the cost of carting the fish from Ballina to the railway?—I do not know what the cost of the road carriage is, but these people generally have their own spring vans and conveyances to do these things. At Ballyshannon they send the fish 24 miles on to Sligo, and they send them by Sligo in preference to sending them by a nearer route from Enniskillen to Dublin, in consequence of the high charges made on the line, and there is also water carriage on Lough Erne.

3301. (*Capt. Galton.*) Is the fishing trade such a trade as would enable the fish to be brought in at a specified time every day, or is there uncertainty about it, so that the railway company cannot start a train at a fixed time?—I think there is no uncertainty about it. They start the Galway train at 12 o'clock at night; that is the mail train, and all the boats are in long before that, and all the fish is carried away.

3302. If there was a similar train from Sligo or Castlebar, would not that be a great advantage?—It would materially assist the fisheries of that district I know from complaints which have been made to me, not only by the proprietors of salmon fisheries there, but by the common fishermen, that they are not afforded the necessary facilities on that line for sending their fish to market.

3303. (*Chairman.*) Are the coarse fish now generally packed in ice?—In some places they are, and in some they are not. In Galway, for instance, I do not think there is any ice, and they send the fish away direct without any ice in the hampers.

3304. When the fish is packed in ice, a few hours delay are not of any importance?—No. In Kinsale the buyers have a regular ice establishment, and they pack the fish in boxes in ice and send it to Dublin.

3305. (*Sir R. Hill.*) Does the middleman pack the fish in ice?—Yes; that is, in one or two places; in Kinsale he does, but he does not in Galway, nor in Ballina, nor in Sligo; at Moville they do. From the Londonderry coast a steam packet takes the fish on from Londonderry to Liverpool and to Glasgow.

3306. (*Mr. Glyn.*) Has there been a large take of fish at Kinsale?—Yes, last year there was. The principal fisheries there are herrings and mackerel, and French fishermen come over there.

3307. (*Mr. Horsfall.*) Is there not a good supply of fish in Dublin Bay?—Yes, but those are not affected by railway carriage; the fish are brought into Dublin by the captors, and they make their market direct there.

3308. That, in some measure, supplies the Dublin market with fish?—Yes; but the buyers in the Dublin market send the fish off to the English markets because it pays them better. The city of Dublin is badly supplied with fish.

With the permission of the Commission, having the various Reports of the Commissioners before me, I will read a few extracts from them, and, first, from the Report of 1850 :—" No branch of " industry is likely to derive a more direct and " immediate benefit than our coast fisheries from " the completion of those great lines of railway " now in progress, while our large inland towns, " as well as the metropolis, are even now furnished " with an abundant supply of fine fish within a " few hours after its capture. The turbot and " black soles of Dingle and Ballingskellegs Bays " taken out of the water on the morning of Thursday " are on the Dublin tables on the following day, " thanks to the persevering efforts of the Royal " Irish Fisheries Company's establishment at Dingle, " and not less to the liberal arrangements of Mr. " Bianconi, who has invariably rendered his con- " veyances auxiliary to the great object of speedy " transit to the nearest lines of railway ; in short, " there is a complete revolution in the trade in Ire- " land. The supply of the fresh market is now the " main object, and in proportion as facilities of con- " veyance are afforded this trade must increase. We " look with great confidence to the completion of the " Midland Great Western Railway to Galway and " the Killarney Junction to Mallow. Our metropolis " will then become the great centre of attraction, " and, after its ample supply, the markets of Eng- " land, approachable within a few hours, will to an " unlimited extent take our surplus. To promote " this important end two objects seem to be most " desirable ; first, a determination on the part of " railway companies to fix their scale of prices so " moderately as to afford encouragement to a large " transit trade. It is quite notorious that no article " of traffic is more precarious in every respect than " fish, from its capture to its last sale to the con- " sumer ; it is full of uncertainty. It never can " bear continuous heavy expenditure, and if the " various operations be not conducted with the most " rigid economy, promptness, and care the under- " taking must fail." Then they go on with their Report.

3309. (*Sir R. Hill.*) Those anticipations have not been realized ?—No. Then, they report in 1853, " Nothing more importantly exemplifies the best, and, " as it has always appeared to us, the only sound " means of improving this trade, namely, quick and " cheap transit to good markets, than the accounts of " the increased carriage of fish by railways and steam " navigation. Our anticipations on this subject have " not been in any degree disappointed, and we look " forward with confidence to the steady gradual " operation of the railway system, the prime mover " of commercial prosperity, especially in remote dis- " tricts, in developing the resources of both the sea " and inland fisheries of this country." Then in 1854 they report, " Several enterprising persons at Water- " ford, Kinsale, Galway, and on the banks of Lough " Foyle have entered extensively into this trade ; and " although they afford a constant demand for all the " fish brought to these places, it is generally at prices " necessarily rendered very low by the cost of trans- " port by the principal railway companies, who ap- " parently do not see the advantage of encouraging " the traffic by a reduced scale of charges ; for, no " doubt, a number of small dealers along the coast " would form connexions in Dublin, and send daily " supplies of fresh fish to the metropolis if the charges " for conveyance were proportionate to the weight. " The plan of giving increased advantage to large " dealers may, as a general principle, be quite reason- " able, if it be more profitable to the companies ; but " under the peculiar circumstances which affect the " trade in fish, from its capture to its disposal, it would " be beneficial to the local traders if some modification " in the charges of small parcels were made. We " have at all times expressed an opinion in our several " reports that the encouragement afforded in the " facility of transit by railway communication pre- " sented the best prospects of improvement in our " fisheries, and we have endeavoured to cultivate " with the directors of the two leading lines an inter- " course which might lead to mutually beneficial " results to the companies and to the fisheries."

3310. (*Mr. Ayrton.*) Having regard to your knowledge of how the business is carried on, would not the natural way be that the wholesale dealer should send his agent to the fish captor, rather than that the fish captor should have an agent at a distance to transact his business with the wholesale dealer ?—The wholesale dealer does not do that, except on the east coast, and there the wholesale dealer has a man watching the boats coming in and buying direct from them.

3311. (*Mr. Hamilton.*) I suppose the middleman buys a boat load of fish ?—Quite so.

3312. And a great deal of that I suppose is unfit to be forwarded by railway ?—Yes ; a great deal of it is thrown away by the middleman, who will not take it. I have seen him casting aside the waste fish. He would not buy it, and it lay there on the fisherman's hands.

3313. Then it is not your opinion, I presume, that the profit of the middleman is so enormous ?—It is enormous compared with the amount that the working man, the fisherman, receives ; but it is not so enormous, that which goes into his own pocket, when you come to enter into a calculation of the losses which he may sustain.

3314. Supposing his profits were so enormous, you would naturally expect to see more middlemen in the market ?—No doubt.

3315. (*Chairman.*) It will be hardly necessary to read extracts from every Report of the Fisheries Commissioners, but you can read from some of the more important ones.—The extract which I am about to read is from the Report of 1855 : " They also " complain of being in a great measure deprived of " the advantage of the market of the metropolis by " the increased rate for conveyance charged by the " railway company from Cork to Dublin, which, " added to the cost of transit from Kinsale to the " former place by cart, a distance of 20 miles, absorbs " the very small profit on fresh fish, in consequence " of which the Dublin market has been wholly de- " prived of any supply from that important district."

3316. (*Mr. Glyn.*) Was there an increase in the rate for that year ?—Yes. They speak of the increased rate in that year. The charge was 10*s.* a ton on that coarse fish. The charge on cod in 1853 was only 1*s.* per cwt., and in 1855 it was 30*s.* a ton. I find that in 1851 it was only 16*s.* a ton, so that the charge had been nearly doubled in 1855, as it was only 16*s.* in 1851.

3317. There appears to have been a great increase in the rate since the opening of the railways ?—Yes, a great increase, and it has been also most fluctuating, for in almost every year the rates have varied.

3318. (*Mr. Ayrton.*) It would be about the sixth of a penny per pound, the advanced rate ?—Yes. When you reduce it to a pound of fish only, an increase of a sixth of a penny upon that would appear to amount to very little.

3319. It was a twelfth of a penny before, and do you think that an increase of a sixth of a penny seriously interfered with the consumption of fish by the inhabitants of Dublin ?—No, not with the consumption ; I do not think it interfered with that, but the Report says, " it absorbs the very small profit on " fresh fish, in consequence of which the Dublin " market has been wholly deprived of any supply " from that important district."

3320. To make that proposition good, the people of Dublin must have ceased to eat fish because there was an increase in the price of one twelfth of a penny per pound ?—It might look in that way, but if the fishermen got nearly the same price in the local markets, then of course he would sell it there.

3321. If fish is consumed in Dublin, and the residents there continue to consume that fish, they can

Mr. T. F. Brady.

24th May 1865.

afford to pay the enhanced price of one twelfth of a penny, and I do not understand how that would prevent the consumption?—I do not think that makes any difference to the consumer.

3322. Does he not pay the increased cost of production?—Yes. I do not think the increased rate by railway would enter into his calculation.

3323. Do you not think that the retail trader could put on the increased price of one twelfth of a penny without stopping the consumption?—Yes, and a much larger increase.

3324. Therefore the increase of price to that extent would not affect the sale of fish in Dublin?—It would not; but with regard to the fisherman, if he could get a market there, seeing an increased rate put on the carriage of his fish, he would send it to the local market.

3325. If the trader could enhance the price by one twelfth of a penny, he could afford, could he not, to give it to the producer?—Yes.

3326. (*Capt. Galton.*) Has not the fishmonger who retails the fish sometimes to sustain a considerable loss from the weather, and therefore the additional twelfth of a penny per pound for the carriage would become more serious than at first sight it would appear to be?—Of course it would be so. There was a company working in Galway on one occasion, in 1855, called the Royal Irish Fishery Company, and it worked very profitably for many years, until some quarrelling took place amongst the directors, and the company was wound up; but the profits were very large, and the Report made in 1855 to the Commissioners states, "We are the only "buyers of ling at this station; were it not for us "the fishermen could not bring their fish to a pro- "fitable market, nevertheless we give rather a higher "price there, for we look upon the people as our "own men. In fact, we are getting ling now at "4*s.* 6*d.* per dozen of 13 elsewhere, and we give "at this station 1*s.* per couple, because we think "the men, by their endurance and industry, deserve "all we can do for them."

3327. (*Chairman.*) Do the subsequent reports refer to this subject?—Yes. There are reports of the Fishery Commissioners and the Board of Works which refer to this subject.

3328. Are they all much to the same effect as those which you have already read?—Yes.

3329. Are there any subsequent periods to which you wish particularly to call the attention of the Commissioners?—There are the Reports of 1860 and 1861, and there are passages in those reports which I think are worthy of attention. The Report of 1861 was the last report which the Commissioners made on the subject.

3330. As I understand you, you have had no interviews with the Boards of Directors?—The Commissioners have had interviews with them.

3331. What has been the result of those interviews?—They have ended in nothing.

3332. Have the railway companies said that it would not be to their profit to make any alteration in the rates they charged?—They have not reduced their charges.

3333. (*Mr. Hamilton.*) Do you believe that any reduction in the freight would increase the consumption of fish brought from the western coast?—I think it would be an encouragement to the fishermen on the western coast if, not only a reduction were made in the freight, but if facilities for transit were afforded. I think that one is as important as the other.

3334. (*Mr. Ayrton.*) Do you mean that there is a want of trains to carry the fish?—Yes; the want of facilities, which is alluded to in the reports, at Castlebar and Sligo, they are most important.

3335. Do you think that in either of those cases a full fish train could be made up?—Upon the great Southern and Western Line, when they have large packages of fish, they make up a train.

3336. I mean in the cases in which you say facilities are wanted?—No, I think not—no special train; but what I would suggest is, that trucks should be attached to the ordinary trains that are run now to carry the fish. I think that the facilities which are required ought to be afforded.

3337. Do the railway companies decline to make a special traffic of the fish traffic in that way?—We have no such thing as special trains for fish.

3338. Have the railway companies refused to attach trucks to passenger trains?—I do not know that they have refused to do so, but I know that they do not do it.

3339. (*Mr. Glyn.*) Have applications been made to them to do so?—I am not aware that there have.

3340. (*Mr. Ayrton.*) I suppose that there is no special traffic in fish, but they might, as in England, put on fish trucks in connexion with passenger trains?—They do not put on fish trucks generally with the passenger trains, they send it by the goods trains, and by that means it takes a long time to get to the market in the first place, and then the train does not start at an hour to suit the senders; for instance, at Castlebar, if a night mail train was put on there, all the fish from that coast could be brought up to Dublin, and be in the market the following morning; but at the present time the fish which is caught on a Monday cannot leave Castlebar until Tuesday at 11 o'clock, and therefore it does not get into Dublin till six in the evening, and it does not get into the market till the following morning.

3341. The railway company does what you suggest from Galway?—Yes.

3342. I suppose it would do the same from Castlebar if there was any desire on the part of the traders to have such accommodation?—No; they do not run a train at all at that hour.

3343. (*Sir R. Hill.*) There is no mail train from Castlebar?—No; the mail train comes from Castlereagh, and between those two places there is a long distance; the mail train from there starts at 12 or 1 at night for Dublin; it does not go on to Castlebar.

3344. (*Mr. Dalglish.*) Do the trains that are run suit the general demands and wants of the people of the district?—There are general complaints made in that district about the trains.

3345. Are complaints made that the trains are not suited to the wants of the people, either as to passengers or to goods?—Neither to the passengers nor the goods, there being only one train at 11 o'clock in the day, so that people starting from any part of that country must start early in the morning in order to reach Castlebar, which is 16 miles from Ballina.

3346. The train is started at 11 o'clock to allow the people time to come in from distant places in the country?—I suppose that that is the reason as to the passenger train, but the consequence is that not only does the fish lose a market in Dublin, but it arrives at an hour when it is too late to send it on, even if it comes at 11 o'clock, by the Dublin packet boats to England, for they start before the fish arrives, and the fish therefore loses the Liverpool market.

3347. You say that the fish traffic is a very small affair?—It is at present a small affair, but I think it might be much increased.

3348. Do you think it would be right or reasonable for the railway company to alter all their arrangements just to suit the traffic of the country beyond Castlebar, and for the sake of the fish traffic?—I do not think that the arrangements of the railway company there have given satisfaction to any party in the country; there is a general complaint of want of accommodation, not only for passengers but also with regard to goods, from that district of the country.

3349. (*Lord Stanley.*) Is not this very much a question of judgment, and is it not the fact that a poor country with a very small amount of traffic cannot afford to run trains so frequently or so cheaply as would be run in a country that was otherwise circumstanced?—Yes, I think that follows as a matter of course.

Mr. T. F. Brady.

24th May 1865.

3350. Have you considered how far that which you complain of, namely, an insufficiency of the railway accommodation, is due to that cause, and how far that cause could be removed ?—I think it can hardly be so. I think the deficiency can hardly be due to that cause. At night the mail train starts from Castlereagh, and you have to travel from Castlebar, a distance of 20 or 30 miles, to Castlereagh over a very bad road, and at night, before you can get into the mail train at Castlereagh ; whereas if they started that train from Castlebar, as I think they formerly did, that would, in my opinion, meet all the requirements of that district, not only as to passengers and goods, but as to the general traffic.

3351. (*Mr. Dalglish.*) Do they never run other trains from Castlereagh ?—There is only one train from Castlebar, which starts at 11 o'clock. I think they used to do, but I am not quite sure about that.

3352. (*Sir R. Hill.*) The train from Castlereagh is a mail train ?—Yes.

3353. Then the expense of that train is probably borne by the Post Office ?—The greater part of the expense, I believe, is borne by the Post Office.

3354. Does not that account for there being no night train from Castlebar to Castlereagh, the Post Office not wishing to have it put on ?—I do not know whether the Post Office wishes to have it or not, or whether the Post Office have taken the railway from Castlereagh because they could not get it from Castlebar; but I believe that the whole of that district of country would be better suited and accommodated by the Post Office taking their mails from Castlebar, which is a very important town, rather than from Castlereagh, which is a very poor one.

3355. If the correspondence is small the cost of a mail train could not be borne by the Post Office? —The correspondence from Castlebar and Ballina must be very large. Ballina is a very fine seaport town, and Castlebar is a large fine town.

3356. Are you aware that in Ireland when the Post Office runs night trains for the conveyance of the mails, the Post Office frequently pays very much more than the cost of the whole train ?—I did not know that ; but from Galway the mail trains have their trucks for the carriage of fish. There are only two trains altogether from Castlebar.

3357. (*Chairman.*) Have you any suggestion to make as to the remedies which you think ought to be applied with respect to the deficiencies on the Irish railways, both as to the passenger and goods traffic ? —As to the passenger traffic we labour, no doubt, under a great many difficulties in the way of getting from place to place in consequence of the trains not running in connexion with one another ; for example, if you want to come from the west to the south you have a delay at Athlone probably of one or two hours ; you also have a delay at Portarlington of one or two hours before you can catch the train on the Great Southern and Western Line. Then if you want to go to Belfast you must remain for four hours at Portadown before you can get a train to go on. And in the same way, if you want to come from Limerick to Dublin you are obliged to stop at the Limerick Station, which is a very bad station, for two hours or two hours and a half before you can get on to Dublin ; and there is no accommodation whatever at the Limerick Junction, that is in consequence of the Waterford and Limerick Railway and the Great Southern and Western Railway not running in connexion with each other.

3358. Can you make any suggestion to the Commission as to how these inconveniences can remedied ? —No, I can hardly do so, except that I think the public are suffering by not being able to carry one through continuous route from place to place in consequence of all these opposing interests on the part of the Waterford and Limerick Company, the Great Southern and Western Company, and the Northern Lines, for they are all running, as it were, almost antagonistically to one another, and not suiting each other in any way. If these opposing interests were united in some way it is clear that the public would be very much benefited by it, not alone with regard to facilities being afforded, but probably the necessary expenditure would be very much reduced.

3359. (*Mr. Ayrton.*) In your opinion is the third-class accommodation sufficient in Ireland ?—No, it is very bad in Ireland. A third-class passenger, for instance, on the Great Southern and Western Line cannot go to Limerick in a third-class carriage, he must stop at the junction and must book second-class. Then again, a third-class passenger, if he wants to come to Dublin to attend the market, must start early in the morning, although he cannot get back at night, and he does not come up in time for his market in Dublin, but he must remain there till the next day, and then he can get no train back the next day, he must remain there until the third morning, so that in point of fact he pays more than a first-class passenger in consequence of the delays which take place. The number of the third-class passengers is most enormous compared with the first-class ; they are four times as many as the first-class passengers in Ireland.

3360. Notwithstanding this want of facilities of which you complain ?—Yes, they must travel, but the poorer classes of the people do not seem to understand the value of money or time in that way. They have to attend these markets, and they entirely forget that it would be cheaper for them to travel by a first-class train and get a return ticket, and by that means get back again, as it is from the delays they expend more than the first class-passengers.

3361. Do you think that if greater facilities were afforded by the railway companies a larger number of third-class passengers would travel, or that those who travel would travel more than they go now ?— I do not know that a greater number would travel, but I think that it is a very great hardship on the third-class passengers to be obliged to pay more than the first-class passengers.

3362. (*Mr. Hamilton.*) Would not their time be saved if they travelled first class ?—Yes ; but it is a misfortune just now that the poor man does not feel or understand the value of his time ; he forgets that from having lost two days in Dublin, although he has travelled so much cheaper, he has not gained anything. I have observed in some statistics that there were over six millions and a half of third-class passengers who travelled in 1863, while only a million and a half were first-class passengers ; the passenger rates are very disproportionate.

The witness withdrew.

Mr. W. Malcomson.

Mr. William Malcomson examined.

3363. (*Chairman.*) Are you the chairman of several Irish railways ?—I am.

3364. Will you be good enough to mention their names ?—I am chairman of the Waterford and Limerick Railway, of the Limerick and Ennis Railway, of the Limerick and Foynes Railway, of the Limerick, Castleconnell and Killaloe, and of the extension from Kilkenny which is now being made to Maryborough ; it is opened as far as Ballyragget, as shown on the map.

3365. You are a director, I believe, of other railways ?—Yes, I am a director in four other railways which are making or are made.

3366. Are they in the same district ?—I am a director of the Waterford and Kilkenny, and of a line which is now being made from Rathkeale to Newcastle, and also another from Clara to join the Shannon near Banagher.

3367. Has your attention been called for many years to Irish railways ?—Yes ; within the last five years more particularly, since I became chairman of the Waterford and Limerick Railway.

Mr. W. Malcomson.
24th May 1865.

3368. Are you of opinion that the present state of the Irish railways is satisfactory either to the shareholders or to the public?—Not generally so to the shareholders, but the public I conceive are generally fully convenienced by our railways.

3369. Have you any suggestions to make to the Commission as to any additional conveniences which the public could derive from the railways in Ireland, or by which the railways could be made more profitable to the shareholders?—I am of opinion that a large amount of relief could be conceded to the railway interests of Ireland by obtaining from Government advances like those which they are at present offering to navigation in the different parts of the country. For instance, at the present time I am a member of the Harbour Board at Waterford, who are obtaining from the Government an advance of money for the purpose of deepening a ford which interferes with the navigation between the city of Waterford and the sea; we are obtaining a loan for that purpose, which is to be repaid within, I think, 40 years.

3370. (*Mr. Ayrton.*) At what rate of interest is the money to be obtained?—I think the interest is to be 4¼ per cent., 1 per cent. being to recoup the principal.

3371. (*Sir R. Hill.*) What is the amount of the loan?—25,000*l.*

3372. (*Mr. Glyn.*) Is the rate of interest to be 5¼ per cent.?—3¼ per cent.

3373. (*Lord Stanley.*) You propose that assistance should be given to the railway companies in Ireland by the Government?—Yes, to those railway companies who could show, as the Harbour Commissioners of Waterford did to the Government officials, that they had an income beyond the working expenses of their line that would be a sufficient guarantee for the repayment of the interest and the advance made.

3374. You propose that such loans should be granted on the terms you have named, viz., 3¼ per cent., exclusive of sinking fund?—Yes.

3375. If you were to go into the market to borrow the money, would you borrow it at 4¼ per cent.?—We are obliged to pay 5 per cent. and in some instances 6 per cent. where the income of the company is not so much in excess of the working expenses as to afford to the public a guarantee that their loans are perfectly safe.

3376. That is to say, in many cases these companies cannot give perfectly good security, and they are compelled to borrow money on higher terms?—Yes.

3377. Your proposal is that the Government should take a bad security, and should enable you to borrow money at the low rate of interest which usually accompanies the highest class of security?—I propose it where the Government can be satisfied that there is a fund beyond the working expenses of a line, an income that will recoup the interest and the money which the Government should advance. We have a large amount of securities which are called railway debentures, and of those originally the Government, in order to facilitate the making of railways, advanced a third, so that if a railway company obtained powers under their Act to borrow 90,000*l.* by issuing debentures, the Government advanced, say, 30,000*l.*; that was in the early stages of railways.

3378. (*Mr. Hamilton.*) Has that money been repaid?—Almost all of our railway companies are in the course of repaying it, those who have had it.

3379. They are repaying the advance made by the Government?—Yes.

3380. (*Lord Stanley.*) What you suggest is, that the Government should lend the railway companies money at a rate of interest at least 1 per cent. less, and perhaps 2 per cent. less, than you can get the money for anywhere else?—Yes; these debentures are issued for some three, five, or seven years, and they are coming in for re-issue now, and what I would suggest is, that the railway companies, having satisfied the Government that they have a solvent income wherewith to repay them, should have a facility afforded to them of exchanging those debentures for—in fact, obtaining the money from the Government as they come in.

3381. Do you propose that the Government should lend to you upon the terms on which you could obtain money in the market, or do you propose that the Government should lend to you on much lower terms, making you, in fact, a present of the difference between the two rates of interest?—The Government appear to be willing to facilitate or improve one class of communication, that is, the water communication, by making advances for improvements. There is no question but that Ireland has been advantaged by railways, and may be further advantaged, and by obtaining money in this way it would cheapen the working of the railways, and obtain, for railways perhaps that are to be made, advances from capitalists, on the prospective probability or possibility that when the lines were working that capital could then be exchanged for Government advances.

3382. Will you explain the reason why if this course of proceeding is peculiarly appropriate to Ireland, it does not also apply to the case of any English company?—We have but a limited number of parties in Ireland who have money to invest in railway debentures, and from other sources they have opportunities for getting interest, say, by making advances on land, which there is not the same opportunity of doing in England. Five per cent. can frequently be had for advances on land, and the Irish investing public are very fond of a mortgage on land when they can get it through their solicitor or others; and we have to compete with that class of security in the market, and we must in order to obtain the money often give higher rates of interest.

3383. (*Mr. Ayrton.*) Do you propose that the difference in the amount of the interest shall be a boon or a bonus for the benefit of the railway shareholders, that it should go into their pockets?—It will cheapen the working expenses by so much.

3384. Do you contemplate that benefit being obtained for the advantage of the railway proprietors or for the public?—I think I have shown how it would facilitate and increase the making of railways in Ireland, instead of having to come, as they do generally, to the English market for the money requisite to make a railway.

3385. If you obtain a loan of money at a lower rate of interest there would be so much more for dividends, would there not?—Yes, because as we cheapen the working expenses we can work so much the cheaper.

3386. Do you contemplate any addition to the dividend of the shareholder consequent upon his gain of interest?—The shareholders would benefit and the public too, because as we could work cheaper we should haul cheaper.

3387. Do you contemplate any increase of dividend from the reduction of interest?—Some benefit must result to the shareholders.

3388. Is that the principle upon which you contemplate any reduction of interest?—I think the great object is an increased extension of railways, because—I will take any of the main lines of railway, such as the Waterford and Limerick, or the Great Southern and Western,—as small lines are made into other districts they bring increased traffic on to those lines, but those small lines will not be made unless the capital can be obtained from capitalists.

3389. Do you conceive that the main object of this saving of money by the railway companies is to make lines of railway profitable that would not be profitable without it?—That is one object, and another object is to cheapen the working expenses connected with the system of working railways in Ireland, which we all believe will be a general benefit to the country.

3390. If you propose a reduction of rates which would give the benefit of this interest to the public,

will you state what arrangements you propose that Parliament should make to ensure that reduction of rates in the conduct of your business, and to ensure to the public the benefit to arise from a reduction of interest?—I am not prepared to lay down any plan for that purpose.

3391. What guarantee should we have that the bonus which would be given to the railway companies would be applied for the benefit of the public rather than for the benefit of the shareholders?—I could not suggest any form of guarantee.

3392. Or any arrangement by which we could secure that object as the legal consequence of the benefit that would be conferred?—No.

3393. (*Sir R. Hill.*) The railway companies have maximum fares prescribed?—They have.

3394. Do you think that the companies would consent to reduce the maximum charge if the Government should make the advances which you recommend?—If the advance was made consequent upon such a consideration, I am sure the railway directors would see their interest in doing it, merely to carry out the view which so many entertain, that as you reduce the rates you rather increase the traffic, that is, that there is a per-centage of increase as the rates are reduced.

3395. (*Mr. Glyn.*) Do you think that would be to any considerable extent?—No; I believe that Ireland is peculiarly circumstanced as to a reduction of rates; we have not the population, and we are not inclined to travel so much.

3396. (*Mr. Horsfall.*) Are all the railways with which you are connected dividend-paying lines?—No, some of them pay no dividend.

3397. What rate of dividend do the different lines with which you are connected pay?—There is only one, the Waterford and Limerick, and the dividend has varied from 1 to 2 per cent.; the last dividend was but 1 per cent.

3398. What are the rates upon that line as compared with the rates in England, say on the London and North-western line?—We follow the Parliamentary rates very much in our charges, 1*d.* a mile for third-class, 2*d.* for second-class, and 3*d.* for first-class passengers.

3399. You stated just now that you thought the public were fully convenienced by the railways?—Yes.

3400. Is that the opinion of the public themselves?—The public are very difficult to satisfy in the matter of railway accommodation.

3401. Have you had some complaints made?—Yes; but I do not think they have been made with much reason.

3402. Have complaints been made as to the number of trains run or the fares, or both?—More as to the facility of going to one point and returning from it in a day. There is a very general idea that for long distances many persons would like to go and return in a day, but we do not find, particularly with our third-class passengers, that it suits either their convenience or their wants to be able to return in one day.

3403. You do not afford them an opportunity of doing so, do you?—Except upon very short lines; we give them a full opportunity of doing so on short lines, such as we call local traffic. We convenience them on those lines, and on certain days in the week we issue what are called market tickets, which we believe convenience the third-class passenger traffic in the districts which our system serves.

3404. (*Mr. Glyn.*) Do you run those trains at reduced fares?—Yes.

3405. One half?—A little over what would be a single fare for third-class passengers—perhaps a third.

3406. (*Mr. Horsfall.*) Do you find that that pays you?—Yes.

3407. Has not that induced you to make a general reduction of your fares?—We have tried reductions of fares continuously for a week, and we have not found any advantage result from them.

3408. What per-centage of reduction did you make?—From Kilkenny to Waterford we issued third-class tickets, which we thought were likely to be remunerative, but we abandoned that plan and ran third-class carriages with all our trains.

3409. What was the per-centage of the reduction that you made?—I cannot say just at the moment; it is perhaps four years ago since we tried it, and I cannot speak exactly to it.

3410. (*Sir R. Hill.*) Was the experiment tried for any length of time?—I think from one to two years.

3411. (*Capt. Galton.*) Did you issue return tickets to third-class passengers?—We ran third-class carriages both ways.

3412. You did not give them return tickets, but they paid the full fare each way?—Yes.

3413. Have you ever tried return tickets for third-class passengers except by the market trains?—We tried them for less than a year between the town of Carrick-on-Suir and Waterford, a distance of 15 miles, and we found that our receipts were but 1*s.* a train mile, and we require at least 2*s.* a train mile to pay for running a train, exclusive of profit.

3414. Did you do that by attaching third-class carriages?—We ran a special train every morning.

3415. Between what stations did you run the market trains?—We took passengers from Grange, about 10 miles from Waterford, and we charged 1*s.* for a return ticket there and back.

3416. Do you run market trains to Limerick?—Yes, between Tipperary and Limerick, and the short stations have market tickets twice a week.

3417. From those stations to Limerick and back?—Yes.

3418. Do you find that those market trains succeed well?—They do. We do not reckon that they have largely benefited our income, and I may state, for the information of the Commission—it is peculiar in the Irish at least—that we cannot get the Irish farmers to use largely trains going distances shorter than from eight to 10 miles from town; whether it is that they bring their own horses and carts I do not know; they do not come in by the railway. I speak of this as having come under my own observation. There is a train run for a distance of about nine miles from Waterford to Grange, and the market ticket there and back is 1*s.* I have watched the income for two years, and I have obtained a return showing the receipts comparatively in the different weeks of each year, and I have not found that the reduction in the rate charged has sensibly increased our receipts.

3419. (*Sir R. Hill.*) Had it the effect of decreasing the receipts?—I have not the returns by me to enable me to say, but I know that I was greatly disappointed. I was an advocate myself for running local trains at low rates, but where there is a farming district, we cannot get the people to use the railway as we would wish for a short distance.

3420. Do you think the experiment has been carried sufficiently far to enable you to arrive at a certain conclusion upon the point?—It requires a long time to teach an Irishman the advantages of travelling in this way.

3421. I think you have expressed an opinion that upon condition of the Government making advances of money at a low rate of interest, the railway companies would consent to a reduction in the maximum charges?—The Government might make it optional with them before they made the advance if they chose to do so. It is one of the things that a railway company must weigh with its traffic manager, whether the advantage would be equal to the risk.

3422. Do you think that the railway companies would make any considerable reduction?—I have never looked at it in that light, and therefore I can scarcely give an opinion upon it.

3423. (*Mr. Glyn.*) Have any of the railway companies with which you are connected already been

Mr. W. Malcomson.

24th May 1865.

borrowers from the Exchequer Loan Commissioners? —All of them.

3424. Has the interest been regularly paid upon those loans?—Yes.

3425. And the sinking fund also?—Yes.

3426. It has always been paid regularly?—Yes. The money was generally lent for 20 years, to be paid off at so much a year; and only quite lately the Government has assented to the system which I proposed, that the repayment should not be so rapid. That has been conceded, with regard to some of our lines.

3427. What is the rate of interest now?—6½ per cent., payable in 22 years.

3428. What was the original rate at which you borrowed it?—4 per cent.

3429. With a sinking fund of 1 per cent.?—The repaying was to take place in so many years; the money was to be paid in 16 or 20 years.

3430. (*Sir R. Hill.*) Have those instalments always been punctually paid?—The Loan Fund Commissioners have never had to proceed against any one, and I think that that is all we can say; perhaps we have been a little slow, and the Commissioners will understand the difficulty there has been in re-borrowing this money. If a railway company does not stand well with the moneyed public, and we have to repay 20,000*l.* in so many years, we have to re-issue what we have been paying the Government 4 per cent. upon, at 5 or 6 per cent., and there has been no doubt a slowness in the re-issuing, but all the payments have been made.

3431. (*Mr. Glyn.*) I suppose in the case of some of the small railways you cannot borrow the money again in the market?—We have had great difficulty in doing so.

3432. Have you done it, or have the Directors been obliged to make themselves personally liable?—The Directors have been obliged to make themselves personally liable.

3433. The money was not borrowed upon the security of the railway alone?—The repaid capital has been mostly borrowed, and there have been cases in which the Directors have been obliged to give collateral security.

3434. In the case of the Ennis and Limerick Company did the Directors give their personal security?—No.

3435. In the first case did they give their personal security?—No.

3436. (*Capt. Galton.*) In the case of the loans from the Exchequer Loan Commissioners for the improvement of the Harbour of Waterford was the money lent to a company or to a trust?—To a trust.

3437. There was no beneficial interest to the members?—No, but there was a beneficial interest to the locality.

3438. (*Mr. Horsfall.*) Do any of the railway companies with which you are connected run in conjunction with steamboats?—There is a through booking system over the Limerick and Waterford Railway with reference to England.

3439. You are connected with steamboats, are you not?—Yes.

3440. It would be to your interest to have a reduction in the fares charged upon railways, would it not?—Yes.

3441. (*Sir R. Hill.*) I think you stated that there are several new lines of railway in which you are concerned now in progress?—Yes.

3442. May I ask you what is the motive for constructing new lines when the old ones seem to be so unremunerative?—It is found that the prices of agricultural produce where railways are introduced improve in proportion, and that makes it advantageous to the owners of property in the locality to encourage the making of railways. In some districts the landed proprietors give us the land and take shares for the value of it, and in other ways they encourage the making of railways, and by these means I believe that the price of agricultural produce does increase by a considerable per-centage.

3443. Taking into account the advantages derived by the landowner and by the farmer from the improved prices of his produce, even these unremunerative lines may upon the whole be advantageous to the shareholders?—They are certainly advantageous to the locality.

3444. Taking all parties concerned into account?—Yes. Taking the community at large into account they are no doubt advantageous, and it is upon the broad principle of benefiting the general interests of the country that I would press the claim of the Irish interests for advances in the shape which I have mentioned. Take the county of Kerry, for instance, in which there is very little railway communication; there has been an indication on the part of the grand jury of that county that they will guarantee a certain amount of interest if railways are made through the county, and we have found the same in other districts where we have been anxious, that is, the Limerick and Waterford Company have been anxious, that their system should be extended with the view of increasing the traffic over that line, but up to this time those lines of railway are not yet in progress nor being made. But the landed gentry are now finding out that the price of cattle and what the farmer produces increases from 5 per cent. to perhaps a larger per-centage by the facilities which railways afford.

3445. Those advantages to the landowners and others would be, I presume, still further increased if the charges upon the railways were reduced?—Clearly.

3446. But that reduction you believe would lead to loss, so far as the proprietors of the railways are concerned?—Yes. I believe that the railways carry the greater proportion of the produce of the country at the present time.

3447. Are there any means, in your opinion, by which the railway proprietors could be compensated by the landowners and others who would be benefited for any reduction which they might make in the fares?—I believe that it would be quite legitimate to associate the land at certain distances from the line with the taxation that might be required. In some districts I believe that the landed gentry would be willing to bear a part.

3448. You are probably aware that several gentlemen from Ireland have recommended to this Commission that the Government should purchase the railways, and then make a large reduction in the charges for conveyance?—Yes; I am aware of that.

3449. Do you think that if the Government were to become purchasers of the railways the landowners in Ireland and others who would be benefited by a large reduction in the charges would be willing to share with the Government the loss?—I should hope they would.

3450. Do you think they would?—I think that all parties in Ireland derive a benefit from railway communications in the country, and from the facility with which their produce in the shape of fresh meat reaches the English markets; that has no doubt largely benefited them, and in that way I think they would derive more benefit than would be equivalent to the additional cost which might be created. The income might have to be supplemented by a charge.

3451. If they took an enlightened view of their own interests, you are of opinion that they probably would be willing to contribute something?—I think that they are becoming increasingly sensible of the advantage of railways, and that they would be willing to be taxed; but to what extent I do not know.

3452. In order to meet the loss that a large reduction of fares would involve?—Yes; the country has been and would be benefited far beyond any calculation that I could make.

3453. (*Mr. Ayrton.*) Mr. Ryan in his evidence, speaking of a practice which he says has grown up of agents going into the agricultural districts to buy up the produce instead of the producers coming to mar-

ket with it themselves, has stated in answer to question 2714 "would the produce of those persons who "now sell them to hucksters be sufficient to make it "worth their while to go to market and try to sell it "if the fares were lower than they are?—Yes; I "think so. On the Tipperary line and about the "Tipperary district, which is in the hands and management of the Limerick and Waterford Company, they encourage as much traffic as they can "between Tipperary and the towns near Tipperary "and Waterford. Persons going with their firkin, "or perhaps two casks of butter, they give them a "free pass to accompany it there, and the result is "that a good deal of butter goes in that direction "and at moderate charges. In that case they charge "for the firkin of butter and not for the passenger? "—Yes. Do you think that that creates much "traffic?—It prevents this, that when these hucksters come to these people to buy, they will not "deal with them; they go to the market themselves "with their butter. In Limerick we complain of "the absence of that accommodation; but probably "it is not a question that should be considered when "dealing with the question of the general management of the country. From those very points, "Tipperary and nearer to Limerick than Tipperary, "the charge upon butter is more than twice the "price it is to Waterford, for the passenger has to "pay his passage as well, so that the company "that manages the other line gives a greater inducement to a person to send his butter in the "direction of Waterford, and imposes a penalty "upon the person sending it to Limerick. What is "the object of that?—The fact is that the chairman of the company is also the proprietor of the "steamships going out of Waterford; and, of course, "by getting the trade to Waterford the vessels "earn freights which they would not earn if the "trade came, and probably to a better market in "Limerick. You think that in order to drive the "traffic into Waterford he actually allows the passengers to travel for nothing if they bring their "firkins of butter with them?—Yes; he allows them "to travel for nothing to Tipperary, which is nearer "to Limerick than to Waterford?"—Yes; but Mr. Ryan's information is not exactly correct on that subject. Soon after I joined the railways I arranged over the whole system that a farmer with a firkin of butter should be charged 1*d.* for the firkin, and 1*s.* for his ticket. That was universal over the system, that he might take it either way, taking either Clonmel or Tipperary. Either way he paid 1*s.*, and each firkin was charged 1*d.*, and that was done in order to induce the farmer himself to go and sell his butter, and not to have to deal with an intermediate party like a huckster. I was disappointed in the results as to the number of persons who availed themselves of it; but Limerick has not been prejudiced as to that. Other lines of railway with which I am connected, and that are worked by the Waterford and Limerick Company, are worked under joint committees; but the directors on some of those lines were not agreeable to such a system, and it was not followed on the Ennis and Limerick, nor I think on the Limerick and Foynes. On the main line from Limerick to Waterford a farmer could go where he liked.

3454. The same rule prevails over the whole of the line from Limerick to Waterford?—Yes.

3455. The farmer may go either way at precisely the same charges?—Yes.

3456. On the lines in which you are a co-director you proposed to establish the same system, and your colleagues declined to adopt it?—Yes.

3457. It is stated also in the same evidence that there are different rates of mileage, whether you go to Waterford, or whether you go to Limerick, as to goods, are you aware of that difference?—There is very little local traffic between Limerick and Waterford. The great bulk of the Limerick goods traffic for England goes under what is called the through-rate system, either by Waterford or by Dublin.

3458. I think it is stated that the rates are nearly the same, but not quite the same, from Tipperary to Waterford as from Tipperary to Limerick?—There has been some advantage lately in favour of Tipperary as between Tipperary and Waterford, but not very large; the difference is principally caused by terminal expenses. Take, for example, the line from Limerick to Tipperary, there is a terminal expense of 1*s.* 6*d.*, we then put the mileage on afterwards. The same terminal expenses exist only at Waterford, and from that to Tipperary. You cannot expect that the rates will be co-equal with the mileage.

3459. We understand that you calculate your rates upon a uniform mileage; but the difference is caused by the terminal rate being the same for the longer as for the shorter distance?—Not always. Tipperary is competed with by several water routes to Waterford; and to Dublin there is also a certain amount of competition. The butter merchant will send his goods by the route which will enable the butter to reach England in the cheapest way, and with a certain amount of expedition.

3460. Are we to understand that from Tipperary you keep the rates somewhat lower in order that you may enter into competition, either with the direct route to Dublin, or the route to Cork for England?—The rate is a uniform rate from Tipperary to Liverpool, either by Waterford or by Dublin, and the shipper has his option.

3461. Do you exercise great influence over the board of that railway?—As chairman.

3462. Does it rest with you to propose changes in the rates to the board?—They are left very much in the hands of our traffic manager.

3463. Can you explain to the Commission how the impression has got abroad that you influence the rates in favour of Waterford?—No, I cannot.

3464. (*Mr. Hamilton.*) Have you any through booking rates with this country?—Yes.

3465. With what railway?—With the London and North-western Railway.

3466. Where does the London and North-western come into contact with you, is it at Waterford?—I alluded just now to the Tipperary traffic, and the price of a firkin of butter from Tipperary to Limerick, either by Dublin or by Waterford, and on to Manchester.

3467. By Waterford have you through rates?—With the South Wales Railway there is some through booking, but more for the convenience of the public paying the rate than for any reduction of the rate.

3468. Do you issue through tickets, if they are applied for?—Yes.

3469. To Milford?—Yes, or to London *viâ* Milford.

3470. (*Mr. Glyn.*) Is there much cattle traffic on the Waterford and Limerick Line?—At particular times it has been our best source of income.

3471. Has it been increasing of late years?—In the last year and a half it has been decreasing, owing to the scarcity of cattle in the country.

3472. Do you think that the present rate of charge affects very much the transmission of cattle over the the railways?—I do not.

3473. (*Sir R. Hill.*) Do you recollect what the rate is upon your line?—No, it is so much a truck.

3474. (*Mr. Glyn.*) Do you consider that the advantages of sending cattle by railway are so great that if the rate was high that mode would be preferred?—We carry nearly all the cattle in the country.

3475. (*Mr. Hamilton.*) Are there any slaughter houses at Waterford, where the cattle intended for the London market may be killed?—Yes, for pigs.

3476. And for oxen?—No, but we have been for the last two years bringing dead meat, mutton, which is killed in Limerick and Tipperary, and young pigs also from the same places, which we take through to Milford for London.

3477. Are you interested in the cattle trade?—Not at all.

Mr. W. Malcomson.

24th May 1865.

3478. Have you heard complaints made that animals that are brought to London are damaged by being very much bruised?—No, I have not.

3479. Is there at the present time any great traffic in dead meat?—No, not like what the Scotch have from Aberdeen.

3480. Is there any reason why there should not be if you had proper slaughter houses?—I have asked some of our butchers to try it, but they seem to think that they cannot.

3481. Did you never hear of Irish cattle arriving in London so much bruised that they are worth less by so much per pound?—Yes. I have heard that they suffer considerably from the journey. We have not large quantities of fat cattle that go from Waterford to the London market. They are principally store cattle, which come through Waterford and go to be fattened in England.

3482. Are the steamboats suited for the carriage of the cattle?—They are built for them, and they are good boats.

3483. (*Mr. Horsfall.*) The cattle I suppose must be injured more or less by the passage, whether it be rough or smooth?—We find that the cattle men say they prefer the steamer to the railway in some cases. For instance, for the districts about Bristol the short route would be from Waterford to Milford, and from Milford by railway to Bristol, but the cattle men say that the cattle are less knocked about when they are taken direct from Waterford to Bristol.

3484. Then the damage must be incurred at the landing places, for certainly an animal is better stowed in a railway truck than on board ship?—On the contrary, the cattle are generally tied by their heads on board ship, and that is a great support to them.

3485. (*Mr. Gower.*) I understand you to say that you had changed your opinion as to the effect of a reduction in the rates. Was that in consequence of any experiments which you have made?—Perhaps they were not tried long enough, but the result of the experiments that we tried was not favourable. The population is so sparse, and their objects for travelling backwards and forwards are not the same as in other localities. A small farmer does not often want to visit the town.

3486. In what year were these experiments made?—The experiments that were made between Kilkenny and Waterford were made four years since.

3487. Was it during the time of the depression that existed?—Perhaps it was more in that time.

3488. Do you think that the failure was attributable to that state of depression?—I think it was more attributable to the habits of the population—that they did not want to travel as I see them travel in other countries. I cannot account for it, but I have seen the people travelling in Germany and I have been surprised at the numbers. I have seen them travelling in the low-priced carriages, but we do not find that the Irish people travel in the same way.

3489. An experiment tried at a period of depression would hardly be a fair trial?—No.

3490. (*Chairman.*) Can you state over how long a period the experiment was tried?—Only two years.

3491. (*Mr. Gower.*) Do you know what extension of railways has been applied for in the present session of Parliament?—I can give some very general information as to that. A line has been applied for from Thurles to Clonmel and from Clonmel to the coast—to Dungarvan.

3492. What is the distance?—Between 50 and 60 miles altogether. Another line has been asked for near Waterford running through the county, an agricultural line, which the gentlemen in the country are interested in, or should be interested in getting forwarded, which is under 30 miles in length. I do not know what the exact length is.

3493. Are the extensions applied for in this session of Parliament as large as have been on the average applied for in any other session?—Yes, and larger than they have been for several years, and they are intended more to convenience the agricultural localities than what we should call the trading localities.

3494. (*Mr. Horsfall.*) What has been the inducement to apply for these additional lines, seeing that very few of those already in existence pay?—The object is to improve the value of agricultural produce.

3495. Are these new lines promoted by agriculturalists, or by the people generally?—They are promoted more by the landed gentry than they ever were before.

3496. (*Mr. Glyn.*) Do they find the capital?—Yes, to a certain extent. It is finding the capital by giving land and taking shares for it, it is really, in effect, taking so many shares.

3497. Are these lines of railway generally constructed by contractors in the first instance, do they take the risk?—Contractors have generally been the means by which the lines have been made, and these contractors have borrowed the money in England. The railway, of which I am chairman, from Kilkenny, intended to meet the Great Southern and Western, is being made by a contractor, and that contractor has to borrow his money in London, and it would facilitate such money being borrowed if there was a prospect, when the line was made, of traffic sufficient to warrant the Government in advancing money on its debentures.

3498. What does the contractor take as his security in the first instance?—There are two descriptions of bonds. There are what are called railway debentures and what are called Lloyd's bonds, and those are generally what he gets. The subscriptions are expected to be from 1,000*l.* to 1,500*l.* a mile, perhaps 2,000*l.* a mile, and if the contractor can succeed in getting so much subscribed he gets a large profit in the business.

3499. I suppose the subscriptions are given very much in the shape of land?—Yes, by those interested in the railway.

3500. Do the directors and some of the landowners sometimes give their personal security?—Never.

3501. Have they got much into the habit of issuing Lloyd's bonds in the Irish companies?—In some of them. Where they have the power they use it.

3502. Have they power to do so?—Yes. They have power to issue them under their Act.

3503. (*Capt. Galton.*) Have they borrowed much beyond the loans which they are authorized to borrow under their Acts?—Not beyond the powers of the Act under which the railway has been made, and which has allowed them to issue bonds to a certain amount.

3504. (*Chairman.*) Is the issue of Lloyd's bonds authorized by Act of Parliament?—They have been.

3505. (*Mr. Glyn.*) Is there power to do so under the original Act?—Under the Local Act, which enables the company to borrow money, there is a certain amount of power which the company has. These are ordinary bonds.

3506. Do you recollect any Act in which the issue of Lloyd's bonds is authorized?—I am not sufficiently conversant with the matter to say, but I have been connected with companies where we have issued them.

3507. (*Mr. Ayrton.*) A witness who has been examined has given this evidence. He was asked as to the rate charged for coal carried on the railway, and he says, in answer to Question 2532, "I will give "you the rate of charge first to Tipperary. The "rate to Tipperary is 4*s.* 9*d.* per ton from Water-"ford. I believe the distance is 55 miles. Then "from Limerick to Tipperary I find they charge "3*s.* 3*d.* a ton, and the distance is 22½ miles, and "that is a very great disadvantage as to Limerick in "sending coals into the interior?"—The distance

between Tipperary and Cork and Tipperary and Waterford are about the same, and the rate between one point and the other I think rules the coal rate. The coal rates are not always at the same point as common goods rates; they are lower in order that we may secure the traffic wherever we can get it.

3508. What is the reason why so great a preference is given to Waterford over Limerick in carrying coals into the interior ?—It is the longer mileage.

3509. Is there not a difference in favour of the port of Waterford independently of that longer mileage ?—There would appear to be a little in that way ; but it is more to secure the traffic than to give any advantage to Waterford over Limerick.

3510. Do you give through rates upon any part of the line between Waterford and Limerick from England ?—From Limerick and Tipperary we make through rates.

3511. Do you make any through rates by Limerick ?—Do you mean by long sea ?

3512. Yes ?—We do not.

3513. Is the effect of these through rates from Waterford to give a great preference to Waterford over Limerick as a place of import ?—I do not think it.

3514. How is the traffic divided as to the through rates between the shipowner and the railway company, on what principle is that done ?—It was at one time on the principle of a mileage, but latterly it has not been so ; the railway has a much larger proportion than the steamer.

3515. Does the railway get the same mileage rate for the through traffic as for the local traffic from Waterford into the interior ?—The point of competition is between Tipperary and England. The railway from Dublin to Tipperary and from Tipperary and Waterford are the different ends, still the rate is the same from Tipperary to England by whatever route the dealer chooses to send.

3516. What is the principle upon which you divide the income arising from the through transit ?—The principle was at one time a mileage, a comparative mileage, but that is abandoned now, and a larger proportion is given of the mileage rate to the railway now, and the water does not get the same advantage that it did.

3517. Do you get for the railway the same mileage rate as you would if the goods started from Waterford, and were not carried through ?—No.

3518. You made a reduction in favour of the through transit ?—Yes.

3519. With regard to the steam boat, does the steam boat get the same charge for the through transit as it does for conveying goods to Waterford which are not carried beyond Waterford ?—It does not ; there is a reduction there also.

3520. Is the reduction made upon any principle of a per-centage, and in both cases is it an equal per-centage, or is it settled by mere arrangement between the two companies ?—It is a matter of arrangement.

3521. Between the railway company and the steam boat company ?—Yes.

3522. Is that the company in which you are interested ?—Yes.

3523. Is that a public company like a railway company ?—There is a smaller number of shareholders.

3524. (*Mr. Glyn.*) What are the terminals at Waterford ?—We have a fixed terminal at Waterford as much as at Limerick, and it is generally about 1*s.* 6*d.* at Waterford. There is the transit between the railway and the steamer, and that makes it rather difficult to say what it is exactly.

3525. (*Chairman.*) Have remonstrances been made to your board from Limerick, and complaints that Waterford has advantages given to it by the railway company over Limerick ?—There may have been, but I cannot remember that there has been any point made of anything that could be complained of.

3526. Has it not been considered as a great grievance by the people of Limerick that Waterford has advantages given to it ?—Not at all.

3527. (*Mr. Hamilton.*) You say that a grievance has not been proved, but a complaint has been made ?—I cannot remember any complaint coming before our board on the subject for a considerable time.

3528. (*Capt. Galton.*) There were other complaints made by some of the witnesses as to the third-class traffic, and it appeared that the railways which are colored green on the map are all worked together ?—Yes, they are worked by the Waterford and Limerick Company.

3529. It was stated that a third-class passenger leaving Ennis in the morning could not get to Dublin in the same day, and that it would take him four days to get from Ennis to Dublin and back again ; that he must leave Ennis in the afternoon to get to Limerick, where he would have to spend the night, and then proceed from Limerick to Dublin by train at seven in the morning ; and then that there was no return train that day until very late from Dublin, or that there was a train that would take him to Limerick, but he could not get on to Ennis ?—That is the case.

3530. Is not that a great inconvenience with regard to the traffic ?—I do not imagine that any hardship arises from it, because those trains which meet at Limerick are for the local traffic very much, and the connexion between Ennis and Dublin for third-class passengers is such, that a traveller very seldom or ever requires to return. In those districts the people generally receive their supplies from wholesale dealers in the locality. Limerick supplies one district, Cork supplies another, and Waterford supplies another, and any person wanting to go from Ennis to Dublin would require to spend 24 hours there in order to transact his business.

3531. Another complaint was made as to the trains from Limerick to Dublin, that by some of the passenger trains they had to wait a long time at the Limerick junction ?—Yes ; and we have remonstrated with the Post Office as to that ; but our representations have not yet been attended to. The mails used all to exchange at the Limerick junction ; but the Cork people pressed for their train being started from Cork an hour and a half or an hour and three-quarters later in the morning, and that deranged the meeting of the trains. The Waterford and Limerick Company have applied to the Post Office for some remuneration, because they run another train at present, which all acknowledge to be a convenience to the local traffic, and therefore anything which the Post Office requires you to do beyond that, we reckon we have some claim for remuneration for.

3532. Do you carry the mails now ?—Yes ; the local trains all exchange except this one which is complained of, and which is caused by the Post Office interference.

3533. (*Chairman.*) The delay at the Limerick junction has been for a very short period has it not ?—Only for two months ; both the day and the night mails met before at the Limerick junction and exchanged the passengers and mails, and carried them without complaint.

3534. (*Capt. Galton.*) But now, in consequence of the later departure of the train from Cork, if you run a train to meet the mail train, you must also run a local train at the present hours ?—Yes, we must run an extra train over all our system, and we have asked the Post Office for some compensation for doing so. We run, I think, four local trains both ways in a day over the whole system.

3535. (*Mr. Hamilton.*) What answer have you received from the Post Office ?—The subject is at the present time before the officials.

3536. (*Chairman.*) Has there been any diminution in the traffic since this delay occurred at the Limerick junction ?—I should hardly think so. I do not think there is any perceptible difference.

Mr. W. Malcomson.

24th May 1865.

3537. (*Capt. Galton.*) The Waterford and Limerick Railway Company I think had a considerable diminution in their receipts in the year 1863, as compared with previous years ?—Yes.

3538. The number of passengers carried fell down from 650,000 to 606,000 ?—Yes.

3539. Had the fares been raised ?—I cannot now remember the cause of it, but I think there was some amount of local passenger traffic that made up a larger amount from some cause.

3540. (*Chairman.*) Have the fares subsequently been raised ?—The fares were regulated by the local board, the members of which lived very much at the Foynes end of the line, and they kept the rates down rather lower than was usual over the rest of the Limerick and Waterford system ; an advance has been made to equalize the rates over the Limerick and Foynes with what has been charged over the rest of our system rather than any excessive increase.

3541. How much were the fares lowered between Limerick and Foynes formerly compared with what they are now ?—I am not able to speak to that.

3542. Has the result of raising the fares been satisfactory to the railway company, as far as their returns are concerned ?—It has, or we should not have continued it.

3543. Can you make more money by the high fares than the low ones ?—The general traffic of that district has fallen off very little, and there has been great emigration ; but the line has not been so remunerative as it was.

3544. Does the Limerick and Foynes line pay a dividend ?—No ; it does not.

3545. (*Capt. Galton.*) In the year 1861 the total number of passengers on the Waterford and Limerick system was 668,000, and in the year 1863 the number of passengers was 606,000. The total gross receipts from passengers in the year 1861 were 55,000*l.*, and in the year 1863, they were 45,000*l.* ; therefore the receipts from passengers had suffered a diminution of 10,000*l.*?—Yes.

3546. Can you say to what that has been attributable ?—Largely, I think, to the trade of the country, which, about the time to which you allude, fell off very much. The receipts upon our system had been progressive up to that time and until the last year, since when we have been very much at a stand still.

3547. On the Waterford and Kilkenny line I observe that the number of passengers in 1861 was 69,000, and in 1863 the number was 72,000 ; and the receipts have increased from 7,000*l.* to 8,000*l.*, as between those two years ; therefore both passengers and receipts on the Waterford and Kilkenny line have increased, whereas on all the other parts of the system they have decreased. Can you give any explanation of that ?—The Waterford and Kilkenny line was in a very depressed state for some years ; but since the Waterford and Limerick Company got a portion of it we have gradually improved the state of things ; the receipts have gradually increased, both upon goods and passengers, since we had the working of it.

3548. Can you state how the improvement has taken place ?—I do not know, any more than that we have convenienced the public by arranging our trains for them. I have a short return as to the third-class passengers, which perhaps may be interesting to the Commission. The per-centage of third-class passengers which we carry over the Waterford and Limerick line is 30 per cent.; on the Limerick and Foynes line, which has been inquired about, the per-centage is about 60·11 per cent.; on the Limerick and Ennis it is 42·14 per cent. ; on the Limerick and Castleconnel, and Killaloe 54·52 per cent. ; and on the Waterford and Kilkenny line only 27·47 per cent.

3549. (*Mr. Hamilton.*) To what year are you referring ?—1864.

The following paper was handed in :—

WATERFORD AND LIMERICK RAILWAY SYSTEM.

Return showing the total passenger traffic for year 1864, and the proportion thereof under head of third-class passengers.

Passengers, all classes. No.	Name of Company.	3rd Class Passengers, including return. No.	3rd Class Passengers, including return. Amt.	Total passenger traffic.	Per-centage of 3rd Class.
			£	£	Recpts.
219,603	Waterford and Limerick	112,817	7,669	25,587	30·
63,046	Limerick and Foynes -	46,263	2,372	3,946	60·11
48,830	Limerick and Ennis -	29,316	2,203	5,228	42·14
57,915	Limerick and C. Connel and Killaloe.	41,665	910	1,666	54·62
55,604	Waterford and Kilkenny	27,117	2,082	7,579	27·47
Nil.	Kilkenny Junction -	No traffic in 1864.			

3550. (*Capt. Galton.*) It seems to have fallen off in the per-centage very much in 1863 ?—Yes.

3551. In 1863 were you running the return trains which you have spoken of ?—I think we discontinued them at the end of 1863.

3552. Do you think that the reduction in the third-class traffic, which seems to have taken place may be attributed to that in any way ?—It may in some small degree.

3553. I observe that in the year 1863 the number of third-class passengers must have been at least 40 per cent., if not 45 per cent., of the whole number of passengers ?—The Waterford and Kilkenny Railway is a railway which is owned by parties in England, and some of the railway directors were anxious to make the experiment of running third-class carriages with all the trains, and facilitating the exchange of third-class passengers over the line. It was tried for a time, but the monetary results were not favourable, and it was discontinued, for they considered it was not for their interest to run third-class carriages with all their trains.

3554. (*Chairman.*) There was a considerable increase in the number of persons that travelled, as I understand you, but the results were not satisfactory? —No.

3555. (*Mr. Gower.*) Was a majority of your shareholders English or Irish ?—In the Waterford and Limerick line they are Irish, but in the Waterford and Kilkenny the shares are largely held in England.

3556. (*Mr. Hamilton.*) You have stated that you found it difficult to induce the Irish people to travel. It would appear, however, that when you reduced the fares they did avail themselves of the railway very much more ?—I spoke only of short distances, from what we should call omnibus stations.

3557. Is it not really after all a question of price, and not that the people are indisposed to use the railways ?—I think that the population of Ireland are not inclined to travel much. I mean that the agricultural population are not so inclined as town populations to travel, and they will not be tempted to travel by low rates so much as a town population may be.

3558. (*Mr. Glyn.*) Have they in fact any means of travelling ?—They have not.

3559. (*Mr. Hamilton.*) They have not the means, even if they pay low fares ?—I suppose that they have more means to pay the low fares than the higher ones.

3560. Does your board ever receive an offer of traffic, which, upon consideration, they feel themselves justified in declining, because they believe that it will not be profitable ?—I do not recollect much of that, except perhaps occasionally in the timber trade. The owners of woods have once or twice made proposals to us that they would cut down the trees if we would carry the timber at very low rates of charge to a shipping port, but we have scarcely any traffic offered to us.

3561. Have you no mineral traffic ?—Yes ; we have mineral traffic from Birdhill which is on the Castleconnell line, and which we carry to Water-

ford at a favourable rate. We carry all that we can get of that.

3562. (*Sir R. Hill.*) Do Bianconi's cars run in competition with your lines in the same districts?—No, they do not.

3563. Do you know what Bianconi charges per mile?—No; I am not aware of that.

3564. (*Chairman.*) I believe it has been stated that cars run into Limerick from some place 10 or 12 miles from Limerick every day, loaded even beyond what they are licensed to carry, while your trains are running comparatively empty?—There are cars from the neighbourhood of Bruff which come into Limerick.

3565. (*Mr. Glyn.*) Have any propositions been made to your board by the owners of mines to convey a certain given large quantity of coals by your railway at reduced rates?—We carry, I believe, all the minerals that are produced in that district.

3566. Have any parties offered to send an increased quantity to your railway if you would reduce the rate?—We have had proposals made to us to bring coal back to them, I think more than to carry minerals in increased quantities—the object is to get coals for smelting purposes on their premises.

3567. (*Mr. Horsfall.*) Do you bring the coal back at comparatively low rates?—We did not agree with the parties at the time, and the subject was dropped, and it has not been renewed since.

3568. Do your trucks return empty?—No; we carry a large quantity of Indian corn and bread stuffs into the country on the trucks which bring the minerals down.

3569. Do you carry much coal on your railway?—Yes; a considerable quantity. I cannot say that it is an increasing one, but we do convenience the locality in supplying the coal for consumption; but you can scarcely increase the quantity consumed in agricultural districts, for the parties will buy just what quantity of coal they want, and you cannot, by reducing the rate 1*s.* or 2*s.* a ton, increase the quantity of coal consumed, for the farmer will not burn more coal than he just wants. There are no manufactories or scarcely any in the districts that we run through.

3570. (*Mr. Glyn.*) And is there no appearance or probability of manufactories being set up?—There are some small manufactories which are increasing. I am connected with manufactures which are extending, as manufacturers follow the population.

3571. Would not coal carried at a reduced rate be a great convenience to the consumers?—As far as the manufactures with which I am connected are concerned, water communication conveniences us quite as much as the railway, and it cannot be competed with.

3572. (*Chairman.*) Almost all the manufactures in the district are in your hands, are they not?—There are some small ones which I am glad to see increasing, but not to any great extent.

3573. Do you use water power or steam power in your manufactures?—We use both; our water power has gone partly now, for there is scarcely any in the summer, and we are therefore obliged to have recourse to steam power as well as water power.

3574. Which is the most inland town in which you have established any manufactories?—Clonmel.

3575. Is the manufacture flax or cotton?—Flax.

3576. (*Capt. Galton.*) The number of tons of coals carried on the Waterford and Limerick line over the whole system in 1861 was 33,000, whereas in 1863 it was only 21,000 tons; can you in any way account for that decrease?—We competed for some time in supplying Limerick with coal, and possibly it was at that time that we tried to bring the Welsh coal by the railway into Limerick.

3577. Your receipts were 5,000*l.* in 1861, and only 3,000*l.* in 1864?—Yes.

3578. Therefore you appear to have benefited by that traffic?—Yes, to some extent; but then the working expenses must have been larger.

3579. (*Mr. Ayrton.*) We have been informed that if all your rates were reduced 50 per cent. you would have such an increase of traffic that in a few years you could make good any immediate loss consequent upon a reduction; is that your opinion?—If there were minerals or anything else in the country to be carried, I should feel sanguine that a reduction of rates would be beneficial; but I think the railways at the present time do the great bulk of the carrying of the country.

3580. Is it your opinion, taking the country as it is, that there would be no such increase ultimately as would make good any deficiency?—I do not see where it is to come from.

3581. Is it your opinion that any reduction of the rates would produce any such increase of traffic as would make good any deficiency in the income?—If I thought that such would be the case I should advocate it upon our own system.

3582. Is the contrary of that the opinion entertained by your directors?—I think so, and we are a very united board in our working.

3583. Who are the other directors of your company?—Mr. Bianconi is one of them; they are principally gentlemen connected with Waterford and the locality; one or two live up the line. Mr. Fennel lives up the line.

3584. Are those gentlemen well acquainted with the condition of the country and its requirements?—I believe there is no board in Ireland who know it better, or who have studied it more than we have.

3585. (*Mr. Glyn.*) These questions have been considered and discussed at your board from time to time?—Yes; Mr. Bianconi understands the traffic of the country as well as any man, I think, and we work very much in accord with him.

3586. (*Mr. Ayrton.*) Can you say whether you have had any applications made to you for special rates within the last two years; and, if so, in how many instances?—Our special rates will be for the traffic with the other side; with Glasgow perhaps, and the application will be from Limerick I expect, and Glasgow, as to sugar, which is a large article that comes from Glasgow—Glasgow is communicated with by three routes—one by sea, from Limerick to the Clyde, another from the Clyde to Dublin, and by canal or railway to Limerick, and another from the Clyde to Waterford and on to Limerick, and we may have had applications made to us to reduce the rate, but there would be a consequent reduction made for all the routes if we did it.

3587. Have you, except as to sugar, had any applications made to you to make special rates, in order to facilitate and develop traffic in particular articles during the last two years?—I do not remember that we have had any.

3587. (*Chairman.*) You are of opinion that the falling off which would be occasioned by any large reduction of the rates would be not temporary only, but permanent?—I am certain that it would be permanent.

3589. (*Capt. Galton.*) It appears that your cattle and sheep traffic has increased a good deal in the last three years. Does that go to Waterford and then to England?—Yes, and the pig traffic is large; they are slaughtered in the locality.

3590. I observe that the cattle traffic has increased from 31,000 in number to 39,000, and the sheep from 32,000 to 42,000. The pigs have decreased from 246,000 to 228,000?—The cattle traffic was progressively increasing until the last season but one, and I may say that there has been a falling off generally.

3591. This is a return for the last season but one, which shows an increase?—The last season I should have said.

3592. (*Mr. Hamilton.*) Has there been any alteration in the rates charged in the meanwhile for carrying cattle?—No; the rates have been the same. I think there was an advance made in the rates, perhaps two or three years ago—10 per cent.—generally over the system of the Waterford and Limerick and the Great Southern and Western lines, which are the two lines

Mr. W. Malcomson.

24th May 1865.

that we work, and we generally arrange to work as much in harmony with one another as we can.

3593. (*Capt. Galton.*) It is said that if the cattle were carried for lower rates a much larger proportion would be carried ?—I do not think so.

3594. (*Mr. Hamilton.*) Have the cattle been leaving the country by any other routes since you raised your charges ?—No. I believe that the local rates are sufficiently low to secure the bulk of the trade.

3595. (*Chairman.*) Do you believe that any considerable amount of saving in management could be effected by amalgamating the small lines with those with which you are connected, say, with the Waterford and Limerick ?—No doubt there could be.

3596. To any considerable amount ?—Not to any large per-centage ; we are anxious for such an arrangement, but the local shareholders are not satisfied that it should take place yet.

3597. I believe there have been some negotiations for the amalgamation of the Waterford and Limerick Line with the Great Southern and Western Line ?—Yes.

3598. (*Mr. Hamilton.*) You have stated that, in your opinion, it would be desirable to have a guarantee from the Government to reduce the rate of interest upon the debentures ; supposing you obtained that guarantee, to what extent do you think you would benefit by it in figures ?—In figures I should think that our system would benefit by some thousands a year.

3599. Do you know what the amount is that you now have to pay in interest ?—Yes.

3600. In 1863 it appears that your debenture and other debts were 300,000*l.* and odd ?—321,000*l.*

3601. It is stated in the document before me for 1863 that the amount was 301,000 ; what rate of interest were you paying upon that ?—Between 4 and 5 per cent.

3602. Then what could you possibly expect to save if you obtained a Government guarantee, which including the sinking fund would amount to 4½ per cent.?—If the Government would choose to exchange our bond debt and preference debt for that, it would give us the advantage of 1 per cent. upon the original capital.

3603. I mean the debenture debt alone, not the preference stock. If it takes 1 per cent., that would be a saving of 3,000*l.* a year, but would that enable you to give the public the advantage of any appreciable reduction in the fares ?—Not largely, but why I would press this more on the attention of the Commission is, that I think it would be attended with the advantage of inducing an extension of railways through the country, which would be a great thing. Legislation, I think, in that direction is one of the things most likely to be beneficial to the community generally in Ireland.

3604. Is it not wholly without precedent, or can you refer to any instance in which the Government has given a guarantee ?—Not to railway companies. I may mention that I have applied within the last six months to the Government on behalf of our boards, and they have conceded to the extent I have named over the amount of loan which is still unpaid from our companies.

3605. That I suppose was with a view to help you out of a temporary difficulty ?—It was to enable us to finance better.

3606. Did you never hear that a proposal that was made to guarantee the capital of a railway company in Canada was favourably entertained by the Government ?—I did not.

3607. (*Mr. Ayrton.*) Did not the Government advance money to complete the Dublin and Kingston Railway ?—They advanced a large sum of money to complete the Dublin and Galway Railway. They loaned it at 3½ per cent. to the company. They have had it continuously at that rate.

3608. Has not the Dublin and Kingston Railway paid 10 per cent. dividend until lately ?—I cannot speak to that. That line was made before I became connected with railways.

3609. With reference to one of your lines, a gentleman who has been examined has stated in answer to question 2786, "There are cars running at the present "time to certain points upon that line, and there is an "immense traffic that is not taken by rail ; from the "Bruree district there is a four-horse car, and there "are others running from Bruff Kilmallock and Kil-"fillan to Limerick, and people living between Bruff "and Bruree ; even those living in Bruree walk a dis-"tance of seven miles to get upon that car because "they only pay half fare. From Bruff to Limerick "the charge is only 9*d.* for a distance of 12 miles." Has your attention been called to that state of things ?—That district is convenienced by the line called the Cork and Limerick direct, and which we do not work.

3610. (*Mr. Gower.*) I understand you not to be of opinion that the boon granted by the Government should be unconditional ?—No. I say that it should be conditional upon the railway company, showing that they had a traffic which, beyond their working expenses, would be a guarantee for it.

3611. Should they not require as a return for that boon any concession to the public ?—I have been asked that question, and I expect that the railway companies would consider that question favourably, but how far they could meet the views of the Government if they obtained a loan from the Government I could not at the present moment express an opinion upon that would be of any value.

3612. (*Mr. Hamilton.*) I see that the total preferential stock and debenture debt of the Irish railways in 1863 was about ten millions sterling?—Yes.

3613. One per cent. upon that would give 100,000*l.*?—Yes.

3614. Would 100,000*l.* a year applied throughout the whole system of railways enable the companies to give any great advantages to the public in the way of a reduction of fares?—I expect that the railway companies would gladly sacrifice one half of that amount, which would be 50,000*l.* a year.

3615. (*Mr. Glyn.*) You could not deal with the preferential stock as you can with the debenture debt ; there is nothing to induce the preferential stockholder to give up his preferential 5 per cent., which has been paid to him regularly ?—A large portion of the preferential stock is terminable, and the railway companies have the power to pay it off every five years.

3616. Do you wish to pay it off ?—We cannot pay it off.

3617. If you were to do so it would become due at a certain time ?—Yes. If the Government would assist us I may mention that a large proportion of the capital invested in Irish railways is held in Ireland, and if that could be set free in one place I think it would be invested in another, at least a proportion of it.

3618. (*Chairman.*) Would not a large proportion of the Irish railways be paying well now if they had been originally paid for with ready money ?—No doubt of it.

3619. Is it because they have been so much in the hands of contractors that they do not pay well ?—Yes. The contractors have sold their securities at the best price they could get for them, that is the case now, and they sell them in the English market at a discount.

3620. (*Mr. Ayrton.*) The working expense of all the lines in Ireland appears to be 750,000*l.*, and if you receive 100,000*l.* by the assistance of the State, I presume you will be able to reduce your charges to the extent of one-seventh of that amount ?—Yes.

3621. But you could not reduce your charges to the public to the same extent ?—We should look for some little profit by the arrangement, but we should be glad to give a large proportion of it to the public.

3622. You would reduce your whole charges to the extent of 100,000*l.* on your gross earnings of 1,500,000*l.* ?—It is not that so much as it would be

a large measure of general benefit to the public. As I have before stated, funds for making railways are often provided by parties locally interested, and it has been for the benefit of the localities that the money has been advanced.

3623. (*Chairman.*) It has been stated that if the Government were authorized and were willing to buy up all the railways in Ireland they would meet with no difficulty on the part of the shareholders in obtaining them for 50 per cent. of their nominal capital; do you agree with the opinion which has been so expressed ?—As far as our companies are concerned with which I am connected I think we should be glad to sell at 50 per cent. of the original cost.

3624. (*Mr. Glyn.*) The Great Southern and Western Railway Company would not like to do that, I suppose ?—I suppose not.

3625. (*Mr. Ayrton.*) Can you give the Commission any idea what would be the probable per-centage of increase in the working expenses, if your traffic were doubled in quantity. Do you think the working expenses would become double, or increase in a lesser ratio ?—That depends upon whether you refer to goods or passenger traffic ; the passenger traffic frees itself ; we have no terminal charges upon that ; it is not in the same proportion.

3626. Take the goods traffic, would the working expenses be double, or in a smaller proportion ?—I do not think that the working expenses increase beyond a certain proportion.

3627. (*Chairman.*) Are your goods trains light or heavy generally ?—The goods trains are not heavy, on account of our gradients not being very good, and the curves not being good.

3628. Could your engines draw a larger number of trucks in goods trains ?—No, not generally.

3629. (*Mr. Ayrton.*) Do you send forward full trains, generally speaking ?—Our goods trains are more gather-up trains, and they convenience every station along the line ; they arrive, perhaps, full at the far end.

3630. (*Mr. Glyn.*) As to the passenger trains, you could carry, I suppose, a greatly increased number of passengers ?—Yes.

3631. And without incurring any increased expense ?—Yes.

3632. (*Mr. Hamilton.*) One of the witnesses examined stated that the railways could carry coals at a farthing per ton a mile. Do you believe that could be done with your gradients ?—I do not think so. I am connected with a company on the continent, and we send a very large quantity of coals at a halfpenny a ton per mile.

Mr. W. Malcomson.

24th May 1865.

3633. What is the worst gradient upon those lines ?—The gradients generally in Germany, where the mines to which I allude are, are good ; they can haul a 250-ton train.

3634. (*Chairman.*) What are the prevailing gradients on the Waterford and Limerick line, and what is the worst gradient ?—I cannot give a correct statement upon that.

3635. Are there any gradients of 1 in 100, or worse than that ?—There are a few worse.

3636. For any distance ?—They are not very long ; perhaps a mile and a half.

3637. (*Mr. Hamilton.*) Do you know what the lowest rate charged on the English lines for the coal traffic is ?—I do not think it is more than a halfpenny.

3638. Finding the waggons ?—I believe the parties find the waggons at a halfpenny ; on the continent they do not do that.

3639. (*Chairman.*) Do you take an active part in the management of the foreign railway with which you are connected ?—It is as the owner of minerals and coals that I speak of those railways.

3640. What railway do you refer to ?—The railway on which the mines are ; the railway runs through Westphalia, and it is called the Cologne and Minden line. The coal is brought largely into Holland from that district, and they carry the coals for a halfpenny a ton per mile, and find the waggons, and they do reckon to make a profit—in fact it is one of the sources of profit to the Dutch-Rhenish line, and it is an increasing one.

3641. (*Mr. Hamilton.*) At what rate do you carry coals upon your railway system in Ireland ?—We charge generally more than a penny a ton per mile.

3642. (*Capt. Galton.*) I believe it is 4*s.* 9*d.* from Waterford to Tipperary ?—Yes.

3643. (*Chairman.*) Which is a distance of 55 miles ?—Yes.

3644. (*Chairman.*) For the coals which you use at your manufactory at Clonmel is the charge a penny a ton per mile from Waterford ?—In Clonmel we use water power, because we have plenty of water power there.

3645. (*Mr. Ayrton.*) What is the rate from Waterford to Clonmel for coal ?—I think they charge 2*s.* 3*d.* for 27 miles, which is a penny a ton per mile, but there we compete with the river, which carries at the same rate.

3647. Are special rates given to individuals on the line, or are the rates published ?—No ; we have no special rates.

3647*. (*Chairman.*) Have you anything further to state to the Commission ?—Nothing else occurs to me.

The witness withdrew.

Mr. James C. Cooper examined.

Mr. J. C. Cooper.

3648. (*Chairman.*) Are you well acquainted with the cattle trade of Ireland ?—I have done a great deal in it, but not in a very large way, not so much as the regular dealers in cattle.

3649. Have you paid attention to the transit of animals by railway in the south of Ireland ?—I have.

3650. Are you of opinion that the transit is not as large as it might be if railway companies afforded greater facilities ?—I am.

3651. Will you state to the Commission any facts upon which that opinion is founded ?—I find in the Agricultural Return for the year 1863, that of cattle and horses that travel by railway in Ireland there were 528,473, of sheep 470,205, and of pigs 770,941. That I find in Thom's statistics, and I find also in the agricultural returns of cattle in Ireland that in the year 1863 there were of horses and cattle 3,717,454, of sheep 303,931, and of pigs 1,064,802 ; that is, out of the whole number in the agricultural returns only one-seventh of the cattle and horses went by train, and one-seventh of the sheep, and three-fourths of the pigs.

3652. Supposing the agricultural interests to be flourishing, have you ever calculated what proportion of the whole stock of the farmers on the average should travel from home in the course of the year ?—I think if we count the cattle that do not travel every year and those that travel twice and three times, and even more, I think we ought to reckon that almost all travel once a year.

3653. Have you reason to believe that a large number of cattle and horses travel by the road ?—A large quantity.

3654. For distances that it would be worth the while of the owners to put them on a railway if the rates were low ?—Yes, I think so.

3655. It has been stated by a gentleman connected with the railways that he is of opinion that railways carry the greater part of the cattle in the vicinity of the lines of railway ? Do you agree with that ?—I do not.

3656. Does a very large proportion of them go ?—I do not think so.

3657. (*Capt. Galton.*) Do the agricultural statistics afford any means of obtaining the proportion between the number of cattle which are exported from the country and those which go by railway ?—No, I do not think so.

Mr. J. C. Cooper.

24th May 1865.

3658. Do cows also migrate ?—Yes, of all ages.

3659. Do you think the cows travel once a year by railway, or that they ought to travel once a year ?—No, I do not think so. I think that the cows which have milk do not travel more than once every three years.

3660. Probably only once in their lives ?—A great deal oftener than that; they travel into the dairy farms often, and when lean they travel out of the dairy farm into the grazing farm, and they are fattened there, and then they travel out of that to be sold, that is three travellings, and sometimes they are changed twice as stores.

3661. In those migrations would they not be generally at comparatively small distances from the farm to the market-town in the neighbourhood, and from thence perhaps to another farm in the same county ?—No ; the south of Ireland is largely dairy, and then these dry cows, as they call them, go into the grazing parts of Ireland, that is into the county of Meath, Westmeath, and Kildare, that is a great number of them, if they do not all go.

3662. Bearing in mind that there are many ports in Ireland from which cattle are exported, would you not have to deduct a considerable area around those ports from which the cattle would go to market without using a railway ?—Yes, to some extent, but not a *large* area, as the fattening districts are generally distant from the shipping ports, and so are the principal store cattle pastures.

3663. (*Mr. Horsfall.*) Have you heard any complaints made in Ireland as to the rates charged on the railways being too high ?—The usual plaints that I have heard as regards the prices are that they are a third too high ; some people say a half. I should be inclined to say a half, but a third is the usual complaint. I have asked the question, and I have heard that.

3664. Do you think that a reduction of one third in the present rates charged would materially increase the traffic ?—I think so.

3665. (*Mr. Glyn.*) Is the same rate charged by nearly all the railways ?—There are some slight variations I know, but they are almost all equal.

3666. Which is the line of railway on which the lowest rate is charged ?—I think it is the Waterford and Limerick, of those railways that I know.

3667. Do you recollect what the rate is per truck per mile ?—Last year it came, I think, to about 6*s.* a head.

3668. We have been informed that there is a great deal of traffic on that line of railway at that rate ?—Yes, there is.

3669. What is the rate charged on the Midland Line ?—I do not know.

3670. It is higher, is it not ?—I do not know.

3671. (*Chairman.*) All fat cattle that travel any distance at the present time go by railway, do they not ?—Yes, almost all. There are some of them that go short distances by road.

3672. That would always be the case, would it not, whatever the charge was ?—No, I think not.

3673. But for a distance of two or three miles ?—Yes.

3674. Or for five or six miles ?—Yes, I should say any distance under about seven or eight miles.

3675. Do you think that any deduction in the rate charged for cattle would induce farmers to fatten a greater number of beasts ?—I do not exactly know, but I do not think it would have that effect.

3676. Do you think that the chief increase that is practicable is in store cattle ?—Yes, I know that there are thousands of cattle bought in the county of Cork and in Kerry, and those cattle that ought to be put into a train are all walked.

3677. (*Capt. Galton.*) Where do they go, to Dublin or to Liverpool ?—They go into the counties of Clare, Galway, and Mayo, and they also go into Kildare, Meath, Westmeath, and Dublin.

3678. To be fattened ?—Yes, and some half fattened.

3679. (*Mr. Ayrton.*) Do you know whether calves are enumerated as horned cattle ?—Yes.

3680. Is there not considerable delay in the movement of cattle in those large districts in Ireland where there are no railways, the breeding or growing counties, and do the statistics to which you have referred include those counties where there are no railways ?—No, the breeding is the greatest in the dairy counties.

3681. In what way are they employed in the large counties where there are no railways ?—They rear up the cattle there to have them fattened in the pasture counties.

3682. Therefore one of the journeys would be made in the district where there is no railway ?—It would be partially, but there are railroads all through the places that I have gone into ; they are not quite through the country yet, but they are through the main part of it.

3683. (*Chairman.*) Can you give the Commission any instances in which, to your knowledge, store cattle are now driven which might be put on the railways ?—I should say that they are driven very often from 50 to 100 miles.

3684. Do you mean in the vicinity of any railways ?—Yes, in a great many instances.

3685. (*Sir R. Hill.*) Can you name those places ?—Yes ; I can point them out on the map, if you wish it.

3686. Have the goodness to do so ?—There are cattle bought in the western parts of the county of Cork and Kerry, and they go into Limerick in that direction (*describing the same*), and on to Nenagh and Roscrea, and Banagher, and a great number go to Mullingar ; a number of them also go to Killalce and Ennis, some to Tuam, and numbers to Athenry, to Ballinasloe, and Mullingar ; 1 and 2-year olds also go from Limerick to Clare and Galway, and the dairy cows, not in calf, to the midland fattening pastures.

3687. (*Mr. Ayrton.*) I understand you to say that the store cattle are driven from the western part of Limerick to the county of Cork, to the markets at Athenry and at Ballinasloe ?—The greater quantities of them go to Mullingar, and large droves of them go into Kildare.

3688. There is no direct railway route from one point to the other, is there ?—There is the Great Southern and Western, and the railway from Killarney to Limerick, and from Limerick to Ennis, that would take them a large part of the way into the county of Clare.

3689. (*Capt. Galton.*) Do you think that if the rates were sufficiently low a larger number of cattle would be taken that way ?—Yes.

3690. What rate do you think would be sufficiently low ?—I would ask to have half off the present rate ; but the dealers in cattle of whom I have inquired only ask for a third off.

3691. Have you compared the rates charged in Ireland with the English rates ?—I have.

3692. How much higher are they than the rates for similar distances in England ?—Those that I know from York to Liverpool are nearly equal ; they are not a great deal lower. Then on the North-western line they will take cattle from Waterford to Liverpool, and down the North-western to London for 2*s.* a head. That is 9*s.* from Waterford to Liverpool, and 2*s.* more if sent from Waterford to London *viâ* North-western, total 11*s.* Waterford to London.

3693. (*Chairman.*) That is from Waterford to London ?—Yes. From Chester cattle are booked through to Dublin for less than from Dublin to Tipperary, both routes having empty return trucks.

3694. (*Capt. Galton.*) Do you know the rates on the Great Eastern railway from Harwich to London ?—No ; I know the rate from Waterford to Bristol would be 11*s.*, and from Bristol to London it would be 11*s.* 8*d.*, making 22*s.* 8*d.* ; more than double the rate *viâ* North-western.

3695. Is that per head or per truck ?—Per head.

3696. (*Mr. Hamilton.*) What would be the rate from Waterford to Liverpool, and then from Liverpool to London, the total charge ?—Only 11*s.*, 11*s.* 8*d.* cheaper by North-western route than by the Great Western, which should be the route ; from Waterford to London is the same sea distance and *half* the rail distance, *i.e.*, *viâ* Bristol.

3697. (*Mr. Ayrton.*) Will you explain how the cattle traffic would be conducted as you suppose from the western part of Limerick to Ballinasloe by railway ; where would it go on to the railway ?—They would train the cattle into Ennis, or they could train them to Parsonstown and Portumna, or they could train them all through the county of Kildare.

3698. That would be a very round-about way, would it not ?—No.

3699. Would not the railway distance be nearly one-third longer, or half as long again ?—No, I do not think so.

3700. (*Mr. Glyn.*) When you mentioned the rates on the London and North-western line for cattle, had they not some relation to the quantity sent ?—No.

3701. There must be, I suppose, a train load ?—I do not know that ; I was not asked a question as to quantity.

3702. Did you never inquire into the fact ?—No.

3703. (*Mr. Hamilton.*) Do you know the rate charged to London by way of Waterford and Milford ?—I do not know the rate ; it is higher than the rate by way of Liverpool and the North-western line.

3704. Although the sea-passage would be shorter ?—Yes ; I think that they take horses that way from Limerick for 2*l.* each, and they send over killed sheep also by that route. I think they charge for them 5*s.* 6*d.* a hundredweight, and then they go on quickly, that is, by Milford Haven.

3705. (*Chairman.*) It has been stated that there is one advantage in driving cattle along the road, which is, that it enables the driver to dispose of a portion of them on the way. Do you think that any weight is to be attributed to that ?—I think that that only applies to a small portion of them ; it only applies to the end of their journey. The great bulk of them go on far.

3706. (*Mr. Ayrton.*) Have you been able to ascertain the cost of driving cattle from the western part of the county of Limerick to Ballinasloe Fair as compared with the charge by railway ?—An instance occurred the other day to myself. I bought 20 cattle at Killarney, and I wished to bring them to a station between Charleville and Limerick. I inquired the rate, and it would have come to 4*s.* a head. I drove them on the road for 1*s.*, when I would rather have paid 2*s.* to have sent them by a train.

3707. In that case you drove, I suppose, straight across the country ?—No ; but it is a great way across.

3708. (*Capt. Galton.*) About how many miles did they travel ?—I should say the distance would be nearly 50 miles.

3709. (*Chairman.*) For that distance, unless the rate had been reduced to one half, you would still have preferred to drive them along the road ?—Yes.

3710. (*Mr. Ayrton.*) Can you give us any other instances ?—I have been told by a trader in cattle, in Waterford, that he walks them from Clonmel and Caher for less than half the charge by the train : and a dealer in them at Cork, who sends over here largely, has told me that if there was a third taken off, he would never send a cow along the road ; and have also been told by an extensive grazier in Clare, that he would send at reasonable rates a thousand sheep to Dublin annually, which now he sends to Ballinasloe to sell ; others in his locality do the same for identical reasons.

3711. Have you made any calculations that have satisfied you that the railway companies could afford to carry them at two-thirds of the present rate ?—The only calculation that I have made has been by comparing the number that travelled in the year 1863 with the whole number in Ireland, and I have found that the number that travelled was only one-seventh of the whole number, and I would suppose that that number would be increased to four or five-sevenths, and also that they would travel further by train.

3712. Your calculation is that the traffic would be increased four or five fold in the course of time ?—Yes, I should think so, after a few years.

3713. Do you think that after that time, with increased working expenses, the traffic would return a larger profit to the railway companies than it does at present ?—I do not quite understand that question.

3714. You have stated that the greater part of the pigs are now sent by railways ?—Three-fourths of them.

3715. (*Capt. Galton.*) Why is that ?—Because they are unable to walk. They cannot go along the roads, and therefore they do not travel as the stores often do. They only travel as fat when they are going to be killed.

3716. (*Chairman.*) Can you state to the Commissioners any other facts respecting the different rates charged either with respect to cattle or goods ?—I have also a memorandum with regard to corn.

3717. Will you be so good as to state any facts within your knowledge upon that subject ?—The charge on corn is 12*s.* a ton from Limerick to Dublin, and they take it by boat to Liverpool for 6*s.* The charge from Cork to Limerick is 7*s.* a ton for corn, and if it breaks the journey it costs 1*s.* 6*d.* more.

3718. (*Capt. Galton.*) If it breaks the journey you mean at some intermediate station ?—Yes.

3719. You are not speaking of Indian corn ?—Not specially, any corn that is ground.

3720. If it breaks the journey and is ground at a mill it is carried on as flour and pays a higher rate ?—Yes. Then again the charge for hay from Limerick to Waterford is 11*s.*, and it is taken through to Glasgow for 20*s.*

3721. That is comparing the cost by the sea route and by the railways ?—Yes. From Limerick to Glasgow it is 1*l.*

3722. From Limerick to Glasgow does it go by sea ?—No, it goes through Waterford.

3723. (*Chairman.*) Is there any large amount of internal traffic in Ireland in the articles of corn and hay ?—Not in hay. It is all outward, if it goes away.

3724. Is corn frequently carried from Cork to Limerick, or from Waterford to Limerick, or from Limerick to Waterford ?—A good deal of it goes from Cork to Limerick.

3725. (*Capt. Galton.*) Is it imported corn that you speak of ?—Yes, it is ; and the complaint is that it goes round the coast a great deal cheaper.

3726. That it can go round a great deal cheaper ?—Yes, and it does go round.

3727. Is not that always the case where there is a coasting trade, and goods can be carried more cheaply than by railway ?—But they say that if it could be carried for 4*s.* instead of for 7*s.* per ton, it would all go by the train, all that corn.

3728. The distance from Cork to Limerick is nearly 61 miles, is it not ?—Yes.

3729. And the charge is 7*s.* a ton ?—Yes. Then the drovers also complain that a whole truck holds 30 sheep, and that they are only allowed to have 12 as a half truck instead of 15, and further that they are only allowed three horned cattle in place of four, eight being the number for a whole truck ; they also complain that if they take four horned cattle they are charged for a whole truck ; they also say that they are not allowed to have a van for the drovers to travel in, and that the drover must travel in the cattle truck and he is often injured and bruised ; they charge them half a fare in a cattle truck and a full fare back, and then if they want to come back again in the evening there is no third-class train for them, they have to wait till the next day, and they are charged a full third-class fare back again ; they complain greatly of that. In England I believe the drovers are not charged. Then the number of tolls on common roads in Ireland makes walking there more expensive.

Mr. J. C. Cooper.

24th May 1865.

In England sheep pens are placed over each other, but not in Ireland.

3730. (*Mr. Hamilton.*) Do you not consider that a loss in the condition and weight of the animals is sustained by sending them long journeys on foot?—Certainly, and I have given evidence to this effect, that where I could walk the cattle for 1*s.*, I should be satisfied to pay 2*s.* to carry them by train.

3731. Would not the result be a great saving of loss in the weight and condition of the animals?—Yes.

3732. What number of miles can you safely drive beast in a day, say in the spring time of the year?—The thin ones ought not to be driven more than from 12 to 15 miles a day, and the fat ones not more than 8 to 10.

3733. If they were to be driven 60 miles, how long ought that to take?—Four days at least for stores.

3734. How many days for fat beasts?—Six days.

3735. Which would be attended with a material loss of condition, and a falling off of weight?—Yes.

3736. More than they would suffer going the same distance by railway?—Yes. In what I have stated I have included the drover's charge, and I have even included the hay when the cattle are driven in the winter. There is one more complaint that these drovers make, and that is that the cattle are not started for hours after they come into the platform, and that they are kept at junctions. They will seldom put a few waggons of cattle on a passenger train for a short distance to catch a goods train, and thus a market is often lost; when the said passenger train was not half a load.

3737. (*Capt. Galton.*) With respect to the loss of condition, supposing the cattle are going to Ballinasloe fair, could the cattle be driven there for sale for less than if they were taken by the railway, say from Killarney?—That would depend upon the weather and the condition they were in when they were bought, and a hundred other little things.

3738. Would extra expenses be incurred by keeping them for a day or two at the fair before they were sold, if they were driven to the fair instead of being sent by railway?—Yes.

3739. That would be so, would it?—Yes.

3740. (*Mr. Hamilton.*) The cattle, I believe, are almost always purchased at so much per stone?—The fat cattle are. The lean ones according to condition and freshness.

3741. The number of stones is calculated, consequently a loss in weight might lead to a serious reduction in price?—Yes; the salesmen calculate that for every day a beast is travelling it loses a stone, that is a stone of 8 lbs., that is the ordinary loss, either walking or by train.

3742. Then in six days travelling the animal would lose six stone, whereas if taken by railway the same distance in one day he would only lose one?—Yes.

3743. (*Chairman.*) If it is so much cheaper to drive store cattle by the road than to send them by railway, how do you account for any store cattle in Ireland being sent by the railway?—There are some of the larger buyers who do not walk with their own cattle themselves, and they do not like to trust those cattle for four or five days at a time in the hands of drovers, and they would therefore rather pay three or four times as much to have them go by the train, but they are often stopped at the junctions for three or four hours, and that is a great objection. Coming here, a gentleman with his family got into the carriage with me at Maryborough, on the Great Southern of Ireland, he was going to Roscommon; at Portarlington, 10 miles on, he was detained 2 hours 20 minutes, again he must remain at Athlone 2 hours 35 minutes, in all 4 hours 55 minutes; whereas he was in motion only 2 hours 30 minutes from Maryboro' to Roscommon. Again the Limerick to Dublin passengers are, by a new arrangement, obliged to wait nearly two hours at the Limerick junction, or travel 1 hour 30 minutes round by the Great Southern *viâ* Charleville. A special cattle train I had, of 20 waggons, on two occasions, went from Limerick to Kildare, 100 miles, in six hours; showing, that with larger trade, companies are willing ta increase the speed.

3744. (*Mr. Hamilton.*) Do you know what the rates charged on the Scotch railways for cattle are?—No. Then as to turf, that is also charged for from Limerick to Croom 3*s.* 6*d.* a ton, that is only for about eight miles, and it is charged to Charleville 6*s.*, and that is a country that it is greatly required in.

3745. Is much of that charge owing to terminal charges?—No, I think it is the railway charge only.

3746. Is not turf an article on which the expenses at the stations would be considerable?—Yes, there is a good deal of it.

3747. And the charge would therefore be proportionately high for the short distances compared with long ones?—Perhaps so. Then with respect to parcels, I constantly get parcels of exactly the same size and the charges are not the same.

3748. Do you mean by different lines of railway?—No; I mean on the same line. Since I received a summons to attend the Commission, I have had three boxes, and those boxes came from Dublin, and one of them was charged 1*s.* 7*d.*, another was charged 2*s.* 1*d.*, and the other was charged 1*s.* 1*d.*, and yet they were exactly of the same size.

3749. (*Capt. Galton.*) Were they of the same weight?—I cannot say, but they held in them the same articles.

3750. (*Chairman.*) Have you made any inquiries as to the reason why these different charges have been made?—I inquired about it and they could not explain it.

3751. Do you imagine that the charges are pretty much in the discretion of the station master at each place?—I do not know, but he said that they had a scale of charges for parcels. I asked him if it was often changed, and he said it was. I then asked him to give me one of his scales, and he said that they only printed one for the use of the office.

3752. (*Capt. Galton.*) They do not publish lists of charges?—No.

3753. Do they not fix them up at the station?—On the Waterford line they do.

3754. Not on the Great Southern and Western?—I do not think they do.

3755. (*Chairman.*) These three different charges were made in the course of a very short time?—Yes, quite so, just after each other.

3756. In the course of a few days?—Yes, in the course of about eight days. I asked them about the charges, and they said that a parcel up to 7 lbs. was 1*s.* 1*d.*, and that a parcel up to 14 lbs. was 1*s.* 7*d.* They will carry in their goods train a parcel if it weighs 56 lbs. for 1*s.* 6*d.*, so that they will carry 56 lbs. as cheaply as 14 lbs.

3757. (*Capt. Galton.*) That is if it goes by a slower train?—Yes, but it is not a great deal slower.

3758. (*Chairman.*) If you desired it would they not send a small parcel by the slower train at a lower price?—No, unless I made it up to weigh 56 lbs., and some persons, by adding stones, do make up a parcel to weigh 56 lbs. With regard to horses, the charge to Dublin for three horses is 5*l.*, that is from Limerick, and the traders in them say that the charge ought to be 3*l.* These horses are put in stalls, and those that go in trucks are charged 16*s.* 6*d.* each; seven horses in a waggon from Limerick to Waterford cost 11*s.* each, not including drover.

3759. (*Mr. Hamilton.*) Have you ever made any comparison between those rates and the rates charged on English railways?—No, I have not. A passenger second class return ticket, from Charleville to Limerick, costs 4*s.* 9*d.*, two persons will drive this 20 miles, per road, for 10*s.*, and a horse will carry four or five persons on the Irish cars.

The witness withdrew.

Adjourned till Friday next at 12 o'clock.

Friday, 26th May 1865.

PRESENT:

The Right Hon. Lord Stanley, M.P., F.R.S.
The Hon. E. F. Leveson Gower, M.P.
Sir Rowland Hill, K.C.B., F.R.S.
T. B. Horsfall, Esq., M.P.
Robert Dalglish, Esq., M.P.
George Carr Glyn, Esq., M.P.
Capt. Douglas Galton, R.E., F.R.S.
E. T. Hamilton, Esq.
J. R. M'Clean, Esq., Pres. Inst. C.E.
Wm. Pole, Esq., F.R.S., *Secretary*.

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S., in the Chair.

Mr. George Willoughby Hemans examined.

Mr. G. W. Hemans.

26th May 1865.

3760. (*Chairman.*) You are a civil engineer?—Yes.

3761. You have been engaged in the construction of several railways in Ireland?—Yes; for about 25 years I have been so engaged.

3762. Will you be so good as to mention the lines that you have either constructed, or are at present constructing?—I have constructed almost the entire system of the Midland Great Western railway as shown by the blue lines on that map, all except the line to Castlebar, which was constructed by Mr. Fowler, but I had the superintendence of it on behalf of the Midland company. That comprises perhaps a fifth part of the railway system. I have constructed a great portion of the green system of railways, that is, the Limerick and Waterford, the Waterford and Kilkenny, the Kilkenny and Maryborough; and part of that is still under my hands and in course of construction. I have also constructed in the north of Ireland the railway from Newry to Armagh, as shown by the yellow line on the map, the railway from Portadown near to Belfast to Omagh; and upon the Londonderry railway I am now constructing a line from Enniskillen, as shown by the dotted lines, by Ballyshannon to Sligo. Then again in Clare the line from Athenry, as shown by the black dotted lines, to Ennis near Limerick; and another shorter line connected with the reclamation of land, as shown by the yellow colour, from Kilrush to Kilkee. These are the principal lines I have been connected with.

3763. Having constructed these railways, you will naturally have taken an interest in those lines which are at present working, and you are no doubt able to give the Commission your opinions as to their affairs generally, the traffic developed upon them, and the system under which they have been managed?—I can give general opinions from observation of the state of the traffic on those lines, but I am not able to give detailed information of the local affairs between one point and another. In a general point of view, I know what the fares are in Ireland, and what the result is upon the travelling of the country.

3764. Are you able to say whether the Irish lines of railway can be worked as economically as English lines with similar amounts of traffic?—I am sorry to say that I am afraid the Irish gauge is not, as has generally been supposed, a good invention. In my judgment, looking at the traffic of that country, it is a mistake; I think it is an impediment to the working of the lines economically. Had the traffic been as great or greater than it is in England, I think it would have been a great advantage to have had a larger stock, and more power for the locomotives; but the fact is, that in Ireland the trade is small, and their rolling stock is heavier, and when the carriages are empty the dead weight is increased to a very considerable extent, I believe by quite 20 per cent.

3765. (*Lord Stanley.*) By the difference which exists between a gauge of 5 feet 3 inches and one of 4 feet $8\frac{1}{2}$?—Yes; the carriages require to have heavier axles and heavier wheels, and heavier iron work of all kinds; heavier frames for the carriages; and even if the carriages are full, they only with their gauge accommodate four passengers abreast, in the first-class carriages, which is done all over the continent, and on some of the English lines, with the narrow gauge. I am afraid that we have imposed a burden upon ourselves by that gauge rather than obtained a benefit.

3766. (*Mr. Glyn.*) It is no great advantage with respect to haulage?—There is an advantage in getting a locomotive engine with less wear and tear. You get a larger fire box conveniently fixed in a larger locomotive, and it is an advantage in the construction of the locomotive itself. You may have rather higher wheels, and the cranks are better accommodated, and the machinery generally; but for the rolling stock I see no advantage.

3767. (*Sir R. Hill.*) Upon the whole is it advantageous or otherwise?—Upon the whole I should not adopt it for the Irish traffic, if it had to be done over again. I should adopt the narrow gauge.

3768. (*Capt. Galton.*) Should you prefer to have the narrow gauge of England, or a narrower gauge than that, for Ireland?—With my present experience, the narrow gauge of England would be the one I should choose, if it were done over again in Ireland; not narrower than that, because that gauge is about as narrow as you can make a locomotive conveniently in. If it was much narrower the difficulties as to the machinery would increase. I should adopt the English narrow gauge, because I believe that it answers very well, and I am afraid that the other is a mistake.

3769. (*Lord Stanley.*) But practically that question is settled, is it not, by the number of lines which are already made on the Irish gauge?—Yes. I think it is impossible now to alter the Irish gauge, and I only mentioned this incidentally as one explanation of the low dividends.

3770. (*Mr. Glyn.*) There is also the expense of working?—Yes.

3771. (*Mr. Horsfall.*) Which is also increased by the cost of the coal?—Yes; and by the dead weight. The dead weight is a very important element in eliminating the profits from the loss on railways.

3772. (*Chairman.*) Have you made any calculation as to the additional cost per mile which you think the Irish railway companies have to incur more than upon the railways constructed on the narrow gauge?—I do not think that that is very material. I do not think that consideration has very materially influenced the railway itself. The rolling stock is dearer.

3773. The cost of running a train per mile, I suppose, is dearer in Ireland than in England?—It is not quite so much; that is to say, the dead weight is greater, and the cost of running a train, per ton, I do not think is different, or not materially so. In the tons taken there is more empty weight.

3774. (*Mr. Glyn.*) The cost of the stock and the loss of dead weight are two principal points, are they not?—Yes.

3775. (*Mr. Horsfall.*) And also the cost of construction?—Not much. I do not think that the mere cost of making a railway is much increased by the 5 ft. 3 in. gauge, the bridges are a little wider, but not much.

3776. (*Sir R. Hill.*) Would the cost of carrying a given number of passengers, or a given weight of goods on an Irish railway be greater than on an English railway?—So long as a carriage which contains, say, 20 persons, is heavier on the Irish gauge than on the English gauge, it must be so much more costly per head to take them.

Mr. G. W. Hemans.

26th May 1865.

3777. You have spoken of the cost of haulage being less, but taking it altogether, is the cost of carrying a given number of passengers, or a given weight of goods, greater per mile upon an Irish railway than upon an English railway?—I think it is somewhat greater, but that is not what I think we have to complain of. I think it is the dead weight on the trains which are never filled; consequently the heavier the carriages are the more it tells.

3778. (*Mr. Glyn.*) The railways are made and the carriages are constructed, but are they not calculated for much more traffic than there is in Ireland to be carried?—That is so exactly.

3779. (*Capt. Galton.*) If the carriages were filled, you do not consider that there would be much difference in the working expenses?—There would be some difference if they were filled, because they would still be heavier carriages in proportion to the number of people conveyed.

3780. Do you consider that the increase of gauge is not sufficient to increase the number of passengers in the carriages, and therefore that you cannot carry more passengers in the carriages than you can on the narrow gauge?—Yes; that is my view exactly. If you take a first class carriage on the Irish gauge it is heavier than upon the English, and unless you can put five passengers abreast in the Irish carriage you lose; you can now only put four. It is not always done in England, but you can on many lines put four people abreast, and therefore in Ireland you lose by the extra weight.

3781. The addition of six inches to the width is not sufficient to increase the number of the passengers?—No.

3782. (*Mr. Horsfall.*) I believe there are very few night trains run in Ireland?—Very few. There are only the mail trains, and those are not upon all railways.

3783. That diminishes the cost of keeping up the line, does it not?—Yes.

3784. (*Chairman.*) Is the cost of maintaining the permanent way less in Ireland than it is in England?—The cost of maintenance is less.

3785. (*Mr. Glyn.*) They are not in the habit of running their goods trains at night, are they?—Yes; they do that on the main lines. The goods trains are run at night; they have latterly began to run them at night.

3786. Are there any respects in which the Irish lines of railway are more economical than the English lines?—There is probably one element of economy, which is this, that the cost of watching is less, the trains being fewer in number, and then not running trains at night, it makes the cost of watching and maintaining less; the wages paid to the workmen are less—otherwise I do not think there are any other elements of difference.

3787. (*Sir R. Hill.*) What is the difference in the amount of wages paid to the policemen and the porters?—There is very little difference in the wages paid to the engine drivers and the stokers, I think they are very nearly the same as those paid in England: to policemen and porters generally the difference is, I dare say, from 25 to 30 per cent. in Ireland.

3788. Will the same number of men suffice for the same amount of work?—A very much fewer number of men per mile will suffice per railway; but whether it is smaller in proportion to the number of tons conveyed I cannot say. I think perhaps not in proportion to the quantity of work done.

3789. (*Lord Stanley.*) Comparing the working expenses on English railways with those on Irish lines, is not the fair comparison to take, not the expenses upon English lines leading from one great town to another, but those upon branch lines made through thinly peopled rural districts?—Certainly; the comparison would be a very wide one to make it between any of the London railways and any of the Irish lines, the comparison will hardly hold.

3790. (*Mr. Horsfall.*) I believe there are very few lines in Ireland on which trains are run on a Sunday?—Almost on all the lines they run one train on Sunday, generally one in the morning and one in the evening, and no more.

3791. Irrespective of the moral question, does it pay to run trains on a Sunday?—They were not found to pay, except on the Kingstown railway, where they pay very well. For suburban traffic it pays very well, but not upon long lines. I doubt whether it would pay to run more than one train a day.

3792. (*Chairman.*) The traffic on the Irish railways has not been progressing of late?—As far as I can observe on all the railways with which I am connected it is lamentably stationary, and it appears that for many consecutive years the traffic per week on many of the lines will vary only a few pounds. Comparing the receipts for a few years back on the same line of railway, they will present a difference only of a few pounds a week in their total receipts.

3793. Is that comparing the present time with only the last three or four years, or with five, six, or seven years back?—It is by comparing the present time with about five years back, there has been very little increase. I do not think that upon the whole there is a falling off in the receipts now, but there is no progress made.

3794. Was there at any time progress made after the first opening of the lines, and for a few years subsequently was there a gradual increase?—There were different circumstances, for instance, three or four bad harvests, and then one or two very good years; there had been I think better harvests than usual, and a great many troops had been in movement in Ireland. There was a large camp established on the Curragh at that time, and from several causes, which I do not accurately remember, there was certainly more prosperity visible in the state of the Irish lines and more hope—there was a great deal of hope entertained—and in that hope a great number of railways were started, some of which I am conducting myself, and in relation to which the contractors were paid in shares to a considerable extent, in the hope of that success which they expected to follow. That hope has been disappointed, and many works which ought to have been completed in about two years have been for five or six years struggling on very slowly.

3795. (*Mr. Glyn.*) I suppose there has been a very considerable addition to the total amount of capital expended in consequence of so many of the lines being made through the means of contractors?—No doubt, and an immense amount of debt has been thrown upon many of the lines in consequence of the contractors having been paid in shares.

3795. Can you give the Commission any idea of the amount of capital which may have been added to the original capital on account of that; was it as much as 20 per cent.?—Fortunately that plan has not been adopted on any of the great lines of railway to any extent; but a great number of small lines—the short connecting links—have been constructed a good deal by discount in shares to the contractors, and by obligations, and so forth. I dare say there may have been perhaps, although of course I can only guess at it, some two millions of money unnecessarily added to the cost of construction.

3797. Would that be 20 per cent. of the whole capital?—I think so.

3798. I presume you mean money unnecessarily expended?—Yes; I mean money raised under discount.

3799. At high rates of interest?—Yes; money which would have been saved.

3800. (*Sir R. Hill.*) Has there been much competition among the contractors?—Not at all; indeed of late in Ireland it has been found extremely difficult to find contractors to take up works upon any terms when they are paid in shares.

3801. That alone, I presume, would add largely to the cost of the works?—No doubt.

3802. Taking that into account, as well as the discounts allowed for cashing the bonds paid to the

contractors, do you think that the additional cost has not been more than 20 per cent ?—I did not state that it was 20 per cent. I made a mere guess in saying that. I thought it probable that at least two millions of money had been wasted in that way unnecessarily ; but I will not say that it was not double the amount taking all the lines of railway into account.

3803. And taking also into account the absence of competition ?—Yes ; considering all the lines which have been made, what may be called second and third class lines, in the last four or five years.

3804. (*Mr. Glyn.*) What rate per mile has it been, taking the average throughout all the lines ?—I think that the average upon all the lines in Ireland paid for in cash, including the main lines, would not exceed 16,000*l.* or 17,000*l.* per mile.

3805. That is a low estimate ?—Yes.

3806. As to those only where the capital has been raised in a forced manner, what has the price per mile been ?—I do not think they have come to more, but they ought to have been made for half the money.

3807. A line of railway has cost 15,000*l.* a mile, when it ought to have been made for 10,000*l.* ?—Yes.

3808. (*Sir R. Hill.*) Do you include in that estimate the rolling stock ?—No.

3809. (*Chairman.*) Do you know anything about the Cork and Youghal line ?—I have been on it.

3810. I mean as to the cost of it ?—I know the character of the country, but I do not know what their capital has amounted to. I should have said that it ought to have been cheaply constructed, for much of it is through an easy country.

3811. You cannot state whether the nominal capital of that line is double what the line might have been well constructed for ?—I know that it was constructed under financial difficulties, and I have very little doubt that it has cost much more than it would have cost if it had been paid for in cash.

3812. (*Mr. Gower.*) When you say that the traffic in Ireland has been stationary, does that apply equally to goods traffic as to passenger traffic, or not ?—I think that in a great many cases the goods traffic, which in Ireland is to a very great extent in cattle, has diminished. My idea as to cattle is, that they have been sent out of the country too fast ; they do not remain to be exported. It is entirely an export trade, and I think the great demand for meat in England of late has drawn the cattle out of Ireland faster than the country can supply them.

3813. Has the diminution in the goods traffic been made up by increasing the number of the passengers ?—No ; I think not.

3814. (*Chairman.*) Has not the diminution in the number of cattle carried been mainly owing to the great pressure put upon the farmers to pay their rents during the last three or four very bad seasons ?—No doubt when the corn crops are low, they are obliged to sell their cattle to pay their rent.

3815. Now that the last season or two have been rather better, there is a prospect that the cattle will increase again in numbers ?—We hope so.

3816. In the last agricultural return for Ireland, there appears to be a very large increase in the number of young cattle ?—Yes, and that seems to show a prospect of an increase.

3817. Independently of any temporary causes occasioning a reduction in the number of cattle, do you think that the railway companies at the present time get all the cattle traffic that they might, if they lowered the fares ?—I think not ; decidedly not. I think that the railway companies are wrong in not lowering the charges for cattle more than they do. I know that cattle in Ireland walk great distances when they ought to go by railway, and they do so very often when the railway is close beside them. I believe that the railway companies are afraid to make the experiment, and one company does not like to do it without the co-operation of another. A general rate of somewhere about 6*d.* per truck per mile for cattle is kept up, when very often by lowering it they would take all the cattle which at present go by the roads. Cattle are frequently walked in Ireland for a distance of 20 or 30 miles, which they ought not to do when railways are at hand.

3818. (*Lord Stanley.*) You do not mean I suppose fat cattle ?—I do not mean stall fed cattle, but grass fed cattle are walked for great distances.

3819. (*Mr. Horsfall.*) Do you believe it would pay the railway companies if they charged much lower fares ?—No. I think it would take some time before they could be paid. An extensive lowering of the fares now would be followed by a temporary loss. I have no doubt there would be a temporary loss, but probably an ultimate gain.

3820. How long in your opinion would it take to recoup the loss ?—That is hard to say. I think that the country people in Ireland going short distances never think of using the railways at all ; their money is very dear to them and they part with it with great reluctance ; their time to them is of very little value, consequently they would rather use their farm horses and carts or walk than use the railway. Unless a very large reduction were made in the fares, and they were taken for a $\frac{1}{2}d.$ instead of a 1*d.* per mile they would not use the railway ; but in the course of a series of years a very low rate would probably induce them to travel. I am quite satisfied that for some years the railway companies would incur a loss, by lowering rates and that they must be strong enough to bear it for some time.

3821. (*Sir R. Hill.*) If their charges were reduced by one half can you give us any idea how long it would be before the same amount of net revenue was obtained as at present ?—I do not think that such a change could occur in Ireland as that the people would be stirred up and induced to take to the railways under certainly five or six years.

3822. Do you think that at the end of five or six years the present net revenue would be realised ?—I think that is probable, but no one could say that it would be so.

3823. In making that statement do you take into account the greater cost of working the lines ?—The comparative cost of working would be less if you only filled the carriages ; if you run a carriage empty the cost is all dead loss, if you fill it a proportional rate is of course an improvement for the company.

3824. Can you conceive a state of things that would lead to the carriages being always filled ?—I think that the carriages might be filled to the extent of 50 per cent. more than they are at the present time. I do not think that they are half filled as they are now. I do not think that the country people use the railways when going to market. I believe that the people living within 10 miles of a market either walk or drive in their country carts.

3825. You are speaking of third-class passengers ?—I am now speaking of third-class passengers; and if you could get them to use the railways they would fill the carriages. I do not think they do at present use them ; there are no manufactures in the country, and the business of the country is transacted at the agricultural meetings in the markets, to which the people go to sell beasts, butter, and eggs, and so forth.

3826. (*Mr. Glyn.*) I believe that the dividends on the several lines of railway have rather fallen off ?—Yes.

3827. You say that the traffic has been stationary. What do you think that has arisen from ? has it been from the cost of maintaining the permanent way and the expenses of repairs falling more heavily upon the companies of late than before ?—That is quite a different point. When I talk of the traffic being stationary I mean that the gross receipts are stationary. The reduction of the dividends, in some cases, is owing to increased expenses on the permanent way ; but the gross receipts represent the moving business of the country, and that has been stationary. Because I think that that only goes upon railways which is obliged to travel by them, that is, where the distances are so great that it must take to

Mr. G. W. Hemans.

26th May 1865.

the railways, and that traffic has not been, in my opinion, stimulated enough by a reduction of fares.

3828. You would say that the dividends have been reduced by there being brought against revenue certain items of charge which had previously been paid out of capital?—I think that much reduction has arisen from that. The Irish railways are just coming to that period of time when their first stock of rails and sleepers is worn out, and the renewal of them becomes a very heavy item.

3829. That is a charge that will go on not simply for one year but it will continue from year to year?—Yes, until all the renewals have taken place.

3830. (*Sir R. Hill.*) In addition to that is there not an actual falling off in the gross recipts, taking into account the increased amount of mileage?—It is not so much an actual falling off, although there is some absolute diminution, as its being stationary while the expenses are increasing. My opinion is that the steamboat traffic across the Irish channel is not in a satisfactory state, and it is a traffic that ought to be encouraged in every way to make the railway companies take the people across. At the present time it is not at all in a satisfactory state.

3831. (*Mr. Glyn.*) With regard to the question of charges, I suppose it would be possible to make a very considerable reduction in some of the fixed charges; for instance, we have been informed that the country is divided into a great many companies all with independent boards, with very large administrations, and with a certain degree of increased expense. Would not the amalgamation of those smaller boards with the larger companies have the effect of reducing the fixed charges?—Yes. There is no question of it that what you have referred to is a great evil; for, except the three or four large companies, the business of the country is in the hands of a great number of small boards, and on some points they act in a very obstructive manner to each other.

3832. In your opinion there might be a permanent reduction in the fixed charges in favour of the proprietors?—Yes.

3833. Have you ever considered how you would parcel out Ireland into districts under a scheme of amalgamation?—No; I have not given that subject such attention as would make my opinion very valuable. I have a strong impression that all those lines that tend to the different eastern ports ought to have their interests identified as much as possible; the business on the western ports is almost nothing, but on the eastern ports everyone aims at becoming the centre of export for the country, and at the present time they compete with each other as much as they can. I think it might be desirable that certain ports in Ireland should be taken to serve as the centres of export for all the lines of railway leading to them, and that those lines should be amalgamated so as to make the charges not obstructive.

3834. The lines of railway running to the eastern ports work at equal rates; they do not compete with each other as to rates, do they?—They compete by continually refusing to book through upon the competing lines.

3835. Take the lines coming to Dublin, they do not refuse to book through on those lines?—No; but they do at Newry. They would book through to Belfast.

3836. Would you suggest an amalgamation of those interests, or how would you propose to get over the difficulty?—Take, for instance, Grenore in Carlingford Bay, below Newry. A great effort is being made there to construct a deep water harbour, and there are two systems of railway converging upon it, the Irish North-western railway running to Enniskillen, Limerick, and Sligo, and the Grenore and Newry railway running to Armagh towards Dungannon and that country. Those two lines of railway are now in a state of hostility and opposition, but they both must run to the pier at Grenore in Carlingford Bay. I think that the amalgamation of such systems as those would be a desirable thing, so that the country should derive the full benefit of those lines of railway without any obstruction.

3837. Do those two systems compete in rates at the present time?—No; I think that the competition is chiefly carried out by diverting the traffic away.

3838. As regards the public, they compete, in fact, for the through traffic from one point to the other?—Yes, but they do not lower the rates to the public; it is more competition by diversion that exists, which I think operates very injuriously. Also in the south of Ireland, goods that would naturally go—cattle, for instance,—from Waterford to the south of England, are controlled by the arrangements that exist, and are obliged to go to Dublin, and thence by Holyhead. All these things result from the competing interests of the different companies.

3839. Are the two northern lines of railways which you have mentioned paying dividends?—The Newry and Armagh railway has never paid a dividend yet; it has not long been opened.

3840. Does it pay the interest upon its borrowed capital?—Yes, I think it does; the other line does not pay a dividend.

3841. Neither the one nor the other?—No.

3842. (*Mr. Horsfall.*) Not the railway from Armagh to Belfast?—Yes, that pays a good dividend; but I have been speaking of the line called the Irish North-western, which is 125 miles in length, and that pays no dividend.

3843. (*Sir R. Hill.*) Are all the receipts absorbed by the expenses?—Yes; and the payments on borrowed money. The preference shareholders get something.

3844. They do pay the interest upon the loans?—Yes, and something on the preference shares.

3845. They pay interest to the preference shareholders?—They pay them something, but the ordinary shareholder gets nothing.

3846. (*Mr. Horsfall.*) What is the dividend upon the line from Armagh to Belfast?—That company not very long ago paid 6 per cent. I believe their dividend now is either $4\frac{1}{2}$ or 5 per cent.

3847. Has that been consequent upon any reduction of the fares?—No; I think it is from a pure excess of expenditure over the previous working expenses, and the non-improvement of the traffic of the country.

3848. (*Mr. Glyn.*) I suppose they have arrived at that point of time when the repairs and the maintenance of the permanent way are coming against them?—Yes; and they have not laid by any mileage rate, or made any provision for extensive repairs.

3849. (*Sir R. Hill.*) You have expressed an opinion that the union of the railways would lead to considerable savings; will you be so good as to point out what would be the sources of those savings?—I will take the line from Dublin to Belfast, that is only 100 miles; there are three boards, three sets of superintendents, repairing establishments, and engineers, secretaries, managers, &c.; there is a very clear case there of unnecessary superintendence and consequent expense for a very short distance.

3850. And a saving might be effected by reducing the three sets of directors, managers, superintendents, &c., to one?—Exactly.

3851. (*Mr. Glyn.*) Would you apply exactly the same observation to the other small lines of railway?—Yes; wherever separate boards, secretaries, managers, and engineers exist; they rather compete with each other than work together in many cases.

3852. (*Sir R. Hill.*) Would there not be in addition another, and perhaps a more important source of saving, inasmuch as the united companies would be able to employ officers of greater talent than they now do?—I think so, decidedly, for the salaries when split up are small and insignificant, and no sooner is a good man found in Ireland than he gets away directly to England, he is sure to be snapped up in England or the Colonies.

3853. You are of opinion, that if the different lines of railway were amalgamated, to use an ordinary expression, there would be a very large saving effected?

—I have no doubt whatever of it. I believe that great benefit might arise to the public under a system of proper control, but so as not to have any unfair monopoly.

3854. (*Mr. Glyn.*) Do you think that the same system might be carried out in the Midland districts?—No doubt of it.

3855. And again in the southern districts?—Yes, certainly.

3856. (*Sir R. Hill.*) Would the whole system be too large for one company to manage with such officers as can be now obtained?—I forget exactly what it is, but I believe that the whole of the Irish railway system put together does not amount to much more in extent than the London and North Western system, taking into account all the lines that they have to deal with.

3857. (*Capt. Galton.*) Do you know, from your knowledge of the railway companies in Ireland, whether they are willing or not to be bought up or amalgamated?—I am afraid that it would be very difficult to obtain any unanimous expression from them upon that. I am afraid that many boards would be very unwilling to become defunct and to surrender their managements. There are a great many jealousies existing at the seaports. All the eastern ports are vieing with each other, and endeavouring to set up different systems of management, and I think it is very doubtful whether there would be any general favour shown to such a measure.

3858. (*Mr. Glyn.*) With regard to the holders of stock, I suppose if there was anything like a moderate chance of getting a dividend they would come into it with pleasure?—I think that they would be delighted to see any measure carried out that would ensure to them a modest dividend on the ordinary shares.

3859. (*Sir R. Hill.*) It has been stated in evidence that amalgamations promoted by the directors have been opposed by the shareholders. Can you at all explain that?—I think it is very probable that the influence of the directors was at work among the shareholders.

3860. (*Capt. Galton.*) Would it not be likely to be so again in case of any attempt being made to amalgamate them?—If the shareholders saw a prospect of a very positive and good result to themselves, I think that they would act more independently. It has been where things were a little doubtful and uncertain that the shareholders have supported the *status quo* of the company.

3861. (*Mr. Horsfall.*) What do you think would be the opinion of the public upon that point, I mean the shippers of goods, and cattle, and produce?—I think that all the shippers of goods, and cattle, and so forth, would feel very uneasy unless there was perfect protection afforded against monopoly; but if such an amalgamation were accompanied with a general large reduction of fares, I think it would be very popular.

3862. And if there was a maximum rate fixed?—Yes; a low one.

3863. (*Mr. Glyn.*) In case of an amalgamation, entertaining the views you do with regard to the stationary condition of the traffic in Ireland, how could you propose a very large reduction of fares with the hope of making it answer?—I should not expect that for many years, because I believe that it would be an experiment that must be made at a loss.

3864. Who is to bear the loss in the meantime?—There is great difficulty in answering that question. I do not think that the country would respond at once to any such measure; but I believe that at the end of 10 years, the experiment would have a very beneficial result over the whole country, at the same time I am satisfied that there would be loss in the meantime.

3865. The question is, who is to meet that loss in the meantime. Is it to be borne locally?—I cannot answer that question, I do not think that the country can do it. I know that a barony rate could not be put on for the purpose. In the west of Ireland a barony rate was put on to enable a line to be constructed from Mullingar to Galway; in that case the barony had a rate put upon them to come in aid of the deficiencies of the railway, and they have had to pay, in consequence of that, altogether a sum of somewhere about 45,000*l.*, which was raised by presentment upon the baronies, and there were very great complaints made, although they got their railway by that means, which they would not have had to this day without it; but many great complaints have been made of it, and I do not think that the country could bear a general rate of that sort.

3866. (*Mr. Horsfall.*) Can you state what the annual rate was that was charged on the baronies in consequence of that railway being made?—It varied I think in very nearly every parish, according to its vicinity to the railway. $3\frac{1}{2}$ per cent. was guaranteed upon half a million, and there was $1\frac{3}{4}$ per cent. raised upon the country for some years; and, as well as I remember, it came to something like 4 per cent. upon the valuation of the district.

3867. (*Sir R. Hill.*) Or the rental?—Upon a valuation of the rental.

3868. It was an additional rate of about 4 per cent. upon the rental?—It was not so much as that, I think.

3869. But taking an average of the whole?—Yes.

3870. It has been stated in evidence that the landowners and agriculturists derive very considerable advantage from the construction of railways?—No doubt they do.

3871. Are you prepared to say whether the advantage derived by those parties from the construction of the railway which you have spoken of from Mullingar to Galway exceeded or fell short of the 4 per cent. additional rate?—Undoubtedly the advantage was infinitely greater than the loss, because the whole amount which they have paid up to this time for a railway which cost half a million of money has been under 45,000*l.*

3872. In how many years?—It opened in 1851, and it has been going on for about 15 years.

3873. You think then that the landowners and others who contributed to this rate have largely benefited by the arrangement?—Undoubtedly; they have benefited very considerably.

3874. Can you explain why they should think the arrangement disadvantageous to them; you stated that they complained of it?—There was a great deal of jealousy existing between them and the railway company. There was a general impression in the county that the line had cost too much, and that the accounts were not fairly treated, and many complaints were made which probably had no foundation, that the line was not worked with so many trains as they wished for, or so economically as it might be, and the levying of this rate made the company very unpopular.

3875. Seeing that the landowners and agriculturists have in your opinion benefited so largely by the construction of railways, might not any temporary loss be borne wholly or in part by those individuals?—I think it is impossible to obtain any unanimity of feeling on the subject. In an abstract point of view, I think there is no doubt that the country would benefit by even paying a rate in aid, if all the railway fares could be reduced one half; but I do not think it would ever be consented to.

3876. Do you think that it would be advantageous to the landowners and others, although there would be practical difficulties in it?—I am certain that if the public in every county of Ireland were assembled together to discuss the question, they would not pass resolutions in favour of it.

3877. Notwithstanding that it would be to their advantage?—Yes. I am certain that the feeling would be that the loss should be borne by the country at large.

3878. Meaning by that Ireland, or the United Kingdom?—The United Kingdom.

3879. (*Lord Stanley.*) Then it would practically be by contributions from England and Wales, the

Mr. G. W. Hemans.

26th May 1865.

taxes in Ireland being comparatively very small?—Yes.

3880. (*Mr. Horsfall.*) You are aware, I presume, that under such an arrangement, 9-10ths of the contribution would be raised by Great Britain?—Very probably.

3881. (*Mr. Glyn.*) I believe the Irish railways pay no tax upon passengers now?—There is no passenger duty.

3882. (*Sir R. Hill.*) It would appear, according to your view, that in the first place great expense might be saved in working the lines by uniting several railways under one general management?—Certainly.

3883. And next, that the temporary loss produced by a large general reduction of the fares and charges would so greatly benefit the landowners and agriculturists, and I suppose also the residents in towns, that if they took an enlightened view of their own interests they would be willing to guarantee the railway companies against that temporary loss?—That is my opinion.

3884. (*Mr. Glyn.*) Still you do not think that you could persuade the gentlemen and merchants in Ireland to agree to any such plan?—I am sure that they would not agree to it.

3885. Have you turned your attention to any other practicable mode by which a guarantee fund could be raised, if any could be?—The object seems to me to be to find some method of trying the experiment of lowering the fares without incurring a public burden, or, in other words, without sustaining a loss; and I have heard it suggested that if the incumbrances upon railways could be supplied by paying them off at more reasonable terms, the companies might be induced to avail themselves of such an offer, upon the condition that they should lower their fares. Many companies are a good deal encumbered with debt, for which they pay very often very high rates of interest.

3886. Have you ever considered the extent to which a saving might be carried, taking into account the large amount of debt that exists in Ireland?—I am afraid that it would not be large enough to cover the loss altogether, but still it might afford a very great relief to the companies if they could obtain money at a low rate of interest; and I have heard it suggested that it might be an inducement to them to accept the condition of reducing their fares so far. But I do not think it would be enough to stimulate the railway traffic over the whole country; much might be done, but I am afraid it would not be enough.

3887. (*Mr. Horsfall.*) Do you think that that would be more effectual than an amalgamation of the different lines?—I think that an amalgamation of the lines, coupled with a reduction of the fares, placing in their hands sufficient power to enable them to try the experiment and to bear the loss, would be a more practicable thing and much more beneficial.

3888. The power of amalgamating is practically in the hands of the railway directors themselves, is it not?—Supposing them to be all reasonably willing to give up their personal advantages, if there are any, in managing the companies, it would be no doubt in their power; but they are too much scattered in Ireland, and they have too many local interests. Gentlemen who live in commercial towns, like Dundalk, Drogheda and Newry, and who are often directors on these separate boards, derive some local importance from that circumstance, and they do not like the idea of giving up what they think the management of their own business to other people.

3889. Have there been in Ireland no amalgamations of railway interests at all?—Several attempts at amalgamation have been made, but they have been defeated.

3890. You are no doubt aware that instances of amalgamations in England are very numerous?—Very extensive indeed.

3891. How do you account for the willingness on the part of the English directors to amalgamate, and the unwillingness on the part of Irish directors to do the same?—I believe that a great many of the amalgamations in England have been caused by pressure on the part of the commercial companies in many cases, and a strong guarantee being given to the weaker company associating with the larger and stronger one to give them fixed advantages. In Ireland such things have been offered; for instance the Great Southern and Western railway company, which is a most powerful company, were anxious to amalgamate with that system of green lines, the Waterford and Limerick, and they even offered them a dividend, which would have been handsome, a $2\frac{1}{2}$ per cent. guarantee, when they were paying nothing, but the jealousy was so great at Limerick and Waterford that the shareholders, either themselves, or stimulated by the directors, unanimously, or by a great majority, rejected that attempt at amalgamation, but I believe they are very sorry for it now. The Great Southern and Western company have absorbed a few weak branch lines, but nothing more has occurred in that way.

3892. (*Chairman.*) Was that amalgamation rejected in consequence of its being the general opinion at Waterford and Limerick that it would work injuriously to their interests as ports?—I think it was imagined, by the people of Limerick particularly, that everything would be worked up to Dublin, that was their idea; and I believe that that feeling was worked upon in order to induce them to reject the proposal.

3893. (*Mr. Glyn.*) Supposing your notion of dividing Ireland into three systems could be carried out by amalgamating these companies, would it be possible that the working of those systems of railways could be satisfactorily carried on by a few boards, unless there was some superintending power to get rid of all jealousies and conflict of feeling?—I think that at every eastern port they would feel dissatisfied unless there was some means of reference in cases where the traffic appeared to be torn away from them.

3894. Would it not be almost necessary to have some representative on the part of the Government upon each board?—I think it would be very desirable to have some referee.

3895. (*Sir R. Hill.*) Unless that referee exercised an authority superior to that of the board in general, would it be possible to carry the plan into effect?—I do not think that any measure of that kind could be carried out without ample power being given to do justice to every line of traffic.

3896. (*Mr. Horsfall.*) You think that there should be some court of appeal from the decision of the directors where there was a complaint made of unequal rates, or of too high rates?—I think it would be desirable.

3897. (*Capt. Galton.*) I think you stated that the whole system would not be too large to be vested in the hands of one company?—I think there should be one or possibly two. I think that Dublin, as hitherto, should be the centre of the principal railways; there are some interests that perhaps might be better managed by having another centre in the north.

3898. At Belfast, for instance?—Yes; I consider that the interests of Belfast and the trade connected with it are of a different character from those in Dublin. I look upon Belfast more as the trading port for Scotland, and it is likely to be so more and more as the ports below it improve, rather than for England. Therefore that system appears to have rather a different centre. I think that all the ports below will make great efforts to improve, and besides, they are much nearer to Holyhead than the Belfast navigation, which is quite out of the way for Holyhead and the south of England. I think that Dundalk, Newry, and Drogheda, are all working against it, and they ought to be better suited for trade to England. Belfast is the best port for the Scotch trade.

3899. (*Lord Stanley.*) Assuming that an amalgamation of Irish railways is possible, and assuming also that a large reduction of fares would produce a temporary loss, but yet would ultimately produce a

gain, do you see any manner by which that temporary loss could be borne by the railway companies without coming upon the Government for assistance ?—I do not, unless it were by a rate in aid levied on the country.

3900. That would be in fact coming to the State for assistance ?—Unless it was confined to Ireland.

3901. Even then you would require the direct intervention of the State ?—Clearly, it would require a special act of Parliament.

3902. Additional taxation, although confined to Ireland, would require the intervention of the State ?—Yes ; it must come from additional taxation, and a rate in aid would be required.

3903. (*Mr. Hamilton.*) Have you made any estimate as to what the effect would be of reducing the rates 50 per cent ?—No ; I have not gone into that.

3904. You cannot give the Commission any opinion upon the subject ?—Not just at this moment.

3905. (*Sir R. Hill.*) I suppose there is no doubt that there would be at once a large increase of traffic ?—I think it would come gradually, not immediately.

3906. I am not speaking of an increase of traffic sufficient to make up the former receipts ; but that there would be at once a large increase of traffic ?—I am afraid not. I believe that even that would only come gradually.

3907. (*Mr. Hamilton.*) When you mentioned before 10 years, what did you mean would be effected in that time ?—I meant that as the period at the end of which I think it is probable the whole loss would have recouped itself; but I only give you that from general impressions.

3908. (*Mr. Glyn.*) Upon how many branches of traffic do you think a reduction could be made to produce any effect ; upon the cattle traffic ?—No ; but I think that reducing the fares of third-class passengers would, before long, although not immediately, induce the people to use the railways, and go to market as much as they could by railway, instead of walking, for instance, if they could travel for a halfpenny a mile, instead of a penny a mile, I think they would use the railways as a settled thing ; but it would take some time before they did it.

3909. (*Mr. Horsfall.*) You have spoken of reducing the third-class fares, would there not be an advantage, and would not the traffic be increased, if the first and second-class fares were also reduced ?—I think that if the second-class passengers, by a reduction of the fares, could be induced to travel first-class, it would be so ; for the persons who now use the first-class carriages are, I think, all of that class to which a reduction of the fares would not be very material.

3910. But would it not be material to the railway companies ?—Of course, if they reduced the fares, and they could get the second-class passengers to travel first-class as the same description of people do in England, it would be.

3911. (*Mr. Hamilton.*) Would it not also be beneficial to induce the people to travel in railway carriages who now walk ?—As to the third-class passengers, decidedly.

3912. Do you see any objection to the railway companies reducing their fares to such a point as to induce persons to travel on the railways for distances up to within 20 miles ?—I see this objection to it. I believe that a temporary loss would follow any reduction of fares that was worth making. I do not believe that the third-class passengers would use the railways generally unless the fares were reduced one half, and such a reduction would certainly begin with a loss. I believe that the railway companies would be afraid to try it.

3913. It would not increase the working expenditure, would it ?—I think it would ; they have now a certain number of third-class passengers who travel continually, and pay 1*d.* a mile, from which they derive a fixed income, and then if they were suddenly to reduce that 1*d.* a mile to a $\frac{1}{2}d.$ a mile, they would only have half the usual receipts. It is clear that until you have got an ample number of passengers, sufficient to bring the receipts up again, there must be a corresponding loss.

3914. How ? — There would be the loss of the money that they would otherwise have received.

3915. If they provided accommodation in a train for third-class passengers, there would be no increase in the working expenditure ?—Not in that sense, but they have been paying a dividend derived from the receipt of fares at a 1*d.* a mile, and if that 1*d.* a mile is suddenly reduced to a $\frac{1}{2}d.$, and no increase in the number of halfpennies received, their dividend must necessarily be reduced, and there must be a loss in that way.

3916. (*Sir R. Hill.*) The effect would be to reduce the gross receipts ?—Yes.

3917. (*Chairman.*) Do you contemplate a gradual establishment of manufactories in Ireland as the result of the low charges ?—I do, decidedly.

3918. Unless such was the result, do you believe that any great increase of traffic would take place as long as the country remained purely agricultural ?—That is a very difficult question to answer. Whether the country has life enough in it to increase the income of the railways without manufactures it is hard to say ; but I think that a very great reduction in the fares would have a tendency to bring manufactures into the country, and especially if coal could be carried into it at a cheaper rate. I am also inclined to think that, merely as an agricultural country, it might in the end pay, and possibly without manufactures. There is a large population, and if they all use the railways extensively it would certainly produce a very different state of things as to the receipts of the companies.

3919. (*Mr. Glyn.*) You are aware, I suppose, that in this country the use of railways in agricultural districts at low fares has led to a very large increase in the number of passengers ?—Undoubtedly; and in other countries as well. I believe that Ireland is more backward than almost any other country in that respect, and I do not see why it should ultimately be different from any other place.

3920. (*Sir R. Hill.*) Do you not think that there is a slowness in Ireland in taking advantage of any change ?—There is a want of money all over the country, and the consequence is that when people have but little of it they walk, and they use their hands and their limbs rather than pay any money at all to travel ; it is only by the greatest indulgence with regard to the fares that they can be induced to come at all.

3921. (*Chairman.*) Do you believe that the consumption of coal in Ireland could be considerably increased if the charges were greatly reduced ?—I think that the introduction of coal into the centre of the country is becoming more important every year. When I visit the country I observe continually that there is a tendency to discontinue the use of turf and to use coal when they can; and if coal was cheaper, and the trucks, which generally come to the ports with cattle and go back empty, were filled with coal, cheapening coal as much as possible, a great deal could be done. If they had coal depôts at the railway stations all over the country, I think that coal would become a very important article of trade.

3922. Are the cattle trucks adapted for carrying coal ?—Yes ; there is no reason that I know of against it. They could not shoot the coal out of them, as they do in England, but they could carry the coal very well in them.

3923. (*Mr. Glyn.*) Suppose the railway companies made a very large reduction in the rate charged for cattle, and they carried back coal from Dublin at a halfpenny a ton per mile in the same trucks, do you think that would answer very well ?—Yes, I think it would answer in the end; but the difficulty is, that there is no money to begin these things with, and the railway companies are not proper speculators in the coal trade, and unless they could afford to carry it at a very low rate, they could not induce other people

Mr. G. W. Hemans.

26th May 1865.

to speculate in it. If the rates were low enough to induce people to speculate in it, such speculations might arise; but at the present time I think that the rates are not low enough for that sort of thing. But I do not blame the railway companies, for I do not believe that they have margin enough to enable them to make these experiments, and they have not made them; their dividends are too low at the present time to make experiments that would lower them for some years.

3924. (*Mr. Hamilton.*) Do you know the total amount of capital invested in Irish railways?—Not at this moment.

3925. Do you know what the net receipts are on the Irish railways?—I have not got the figures in my head just now.

3926. (*Chairman.*) Have you had any experience of the use of turf for steam engines?—I have had a good deal of experience.

3927. It has been stated that turf can be used more economically than coal for steam-engines?—That, in my opinion, is nonsense. It is not so, as regards locomotives, because I have tried it.

3928. (*Lord Stanley.*) Have not all the attempts to compress turf into a very small compass failed?—Yes, commercially speaking. They have produced very nice articles, but they have failed commercially.

3929. They were not found to pay?—No. In using turf I have found that it required three times the bulk of the best turf to be equal to the same quantity of coke or coal. Good turf in Ireland is not cheap, it is a very dear article. By the time it is dug, dried, and kept, and carried to market, it is not at all a cheap article.

3930. (*Capt. Galton.*) It is not burned on the railways for any locomotive?—No, except to light the fires; but not as a rule on any of the railways.

3931. (*Chairman.*) It has been stated that an engine of 12-horse power can be worked with two cribs of turf a day at a cost of 2*s.* 6*d.*?—It is quite possible if you get an engine established somewhere near a peat bog to drive it with turf at a very low rate.

3932. The neighbourhood of Castlebar was referred to?—I look at it in a broader sense. I have tried it, and if you were to require, in Dublin, for instance, a store of really good turf, such as you could depend upon to work the locomotives, it would be dearer than coal to use it. In some places near to a bog, no doubt, turf might be used cheaply enough.

3933. (*Mr. Gower.*) You have stated that, in your opinion, if the fares were reduced, manufactures would be established in Ireland. What manufactures should you expect to be established?—I see no reason why more flax mills should not be established in Ireland. Many of them that are there are doing very well. I see no reason why cloth or woollen manufactories should not be established in Ireland, as it is a country for wool.

3934. Is it the case that in England any manufactories have been established at any distance from where the fuel is produced?—I think not generally, but there is a great deal of water power, not sufficient, perhaps, for all the manufactories; that would come in aid of the manufactories in Ireland.

3935. Then the manufactories which you think would be established in Ireland would be worked by water power?—Not altogether so; but I think it would come in aid of the steam power. Everywhere in Ireland there is a great deal of water power running to waste.

3936. (*Lord Stanley.*) Has it not been tested by actual experiment that under the most favourable circumstances water cannot compete with steam power?—Yes, in England where coal is cheap; but if there is a very large water power, such as exists on many of the Irish rivers, with auxiliary steam it ought to compete.

3937. (*Sir R. Hill.*) Would not water power come into competition, so to speak, with the power obtained from cheap coal in England, that is to say, that the manufacturers in Ireland would have to compete with similar manufacturers in England?—Yes; and if their chief power was water they ought to be able to compete satisfactorily.

3938. It has been stated that a train upon the Irish railways could convey nearly 1,000 tons of coal. Is that in accordance with your opinion?—A single train?

3939. Yes?—I should say decidedly not; it is much too large a quantity.

3940. The gradients on the Irish railways are not superior to those on the English railways, as a whole, are they?—I think that the gradients on the main lines, as a rule, are quite equal, perhaps a little superior, to many of the leading lines in England. One in 100 is perhaps the worst gradient on that whole system of blue lines. There is a portion of 1 in 80; they are not quite first-class gradients—not so good as those upon the Great Western, or the London and North-western lines.

3941. What would be the maximum load of a train upon the Irish lines generally?—That depends entirely upon the number of engines that you choose to work.

3942. Suppose you had a single engine?—If you take a single engine of the most powerful character, looking at that system of blue lines on the map, and supposing the trains to be worked from one end to the other, I do not think you could safely reckon on more than 35 waggons perhaps at the outside, and in each waggon you might take perhaps six tons of coal, that would be 210 tons, the net load.

3943. That you would consider the maximum?—Yes.

3944. (*Mr. Hamilton.*) The worst gradient on that system of blue lines being what?—1 in 80.

3945. (*Mr. Glyn.*) Generally speaking the gradients are a great deal better; are they not?—Generally speaking the gradients are better.

3946. How many miles are there of 1 in 80?—There is not more than a mile and a half in any part. I think you may assume that the working gradient of the Irish lines upon the average is 1 in 100; that is the gradient that limits the load.

3947. (*Sir R. Hill.*) Then the gradients must be inferior to those on the English main lines?—A great many of those in England are 1 in 70. The Caledonian is 1 in 70 for 10 miles consecutively. When I say that the gradient is 1 in 100 in Ireland, I mean the worst gradient, the one that limits the load, that is what engineers mean by the ruling gradient. A great number of the gradients may be level, and yet the worst gradient would be the ruling gradient, because it limits the load.

3948. (*Chairman.*) If there is a gradient only for a short distance, is it not usual to divide the goods trains?—Yes; if there is only one that is short, of course you may divide.

3949. Are there any other points to which you would like to call the attention of the Commissioners?—I was speaking about steam navigation, and I think that any measures that would encourage the putting on of powerful steamers by the railway companies in connection with the Irish ports would be most beneficial.

3950. To whom should you look to encourage the establishment of new steamers?—I think that all the great railway companies that trade to Ireland would be glad if they had the requisite power to put them on.

3951. (*Capt. Galton.*) What impediments are there in their way now?—They have no power to expend capital in that way, the London and North-western company is the only company who can do it.

3952. (*Mr. Hamilton.*) Would any other company, do you think, like to have the power to do so?—Yes. I am certain that the Great Western Railway company would be glad to put on better steamers than there are now.

3953. (*Mr. Glyn.*) Has power been granted by Parliament when it has been applied for?—I believe

that even the London and North-western Company had considerable difficulty in obtaining those powers.

3954. But eventually Parliament granted their application ?—Yes.

3955. (*Chairman.*) I believe the steamboats between Fleetwood and Belfast, and between Morecambe and Belfast belong to railway companies in one way or another ?—I believe that they participate in the property of them ; but they are not of that class, nor are they so efficiently or so well managed as they might be if the companies were empowered to put on fleets of steamers. The London and North-western Company do it most effectually and beneficially to Ireland, and I think it would be most desirable if it could be more extensively done.

3956. (*Mr. Hamilton.*) I suppose you think that as between Waterford and Milford, if the Great Western Company had power to put on steamers, the service would be better ?—Yes ; for I consider that the service there is wretched now.

3957. Has the Great Western Company ever applied to Parliament for powers ?—I am not sure that they have, but there is a general impression that it is very difficult to get such powers. I know that I gave evidence in favour of those powers being granted to the London and North-western Company, but I also know that the Bill was passed with considerable difficulty.

3958. Is it not the case that in the absence of special powers granted by Parliament, a railway company cannot embark their capital in such an undertaking ?—Yes, they know that the shareholders may stop them.

3959. (*Mr. Horsfall.*) Would the adoption of that principle be fair, in your opinion, to independent steamship companies ?—I am looking at it as a thing that would be beneficial to the railway interest. In the other point of view it would introduce a new element of competition. I should not object to it.

3960. Would it not rather do away with competition ?—I think it would induce competition.

3961. In what way do you think any private steamboat company could compete with a railway company which could carry its railway down to the steamers ?—The private company must either improve its accommodation or succumb.

3962. Even with the greatest improvements they could make, do you think it would be possible for any private company to compete with a railway company whose terminus was upon the pier where the steamers started from ?—I think that such a company as the Waterford company, who have an enormous fleet of steamers, could hold their own against any railway company's boats. There happens to be no other steamboat company in Ireland of individuals. The City of Dublin company is another large company that I think would be able to hold its own against any railway.

3963. (*Mr. Hamilton.*) You say that the Waterford Company have already got a large fleet of steamers ?—Yes.

3964. To what ports in England do they ply from Waterford ?—Latterly, it is understood that they have made arrangements to go entirely to Holyhead and Liverpool.

3965. Do they not ply to the southern ports in Wales ?—No. I think they go to Holyhead, and they send boats to Bristol, but none, I think, to Milford.

3966. (*Capt. Galton.*) Are there no boats to Milford ?—Yes.

3967. (*Mr. Hamilton.*) Do you know who is the nominal owner of those boats ?—I forget now who it is in whose name they run.

3968. If there is already a good sea service between Waterford and Bristol, what advantage would Ireland gain by authorizing such a company as the Great Western Company to embark their capital in steamboats ?—I am assuming what is the case, that it is not a good service, that it is not sufficient.

3969. What benefit would Ireland derive from the establishment of an efficient service of the same kind as now exists between Holyhead and Dublin ?—I think it would have the effect of stimulating the export trade all over the country.

3970. (*Capt. Galton.*) You would make steamboats between the English and Irish ports, as it were a portion of the English railway ?—Yes, or a combination between the English railway and the Irish railway, so as to work together.

3971. Would it be advantageous for the Irish railways to be leased in any form to English railway companies ?—I think that in some cases it might be advantageous to them. I think that as much as possible Irish goods ought to be capable of being booked through in every direction to England, and that means of communication should exist for the same goods from one end to the other, from Galway to London, as an illustration.

3972. You would put the Midland Great Western Company into the hands of the London and North-western Company ?—Not exclusively. The tendency of my evidence is, that as many English companies as would be disposed ought to be able to put on fleets of steamers in connexion with the Irish railways, so as not to give an exclusive monopoly to any one line.

3973. (*Chairman.*) Are there instances in which you think it would be profitable for a railway company to establish a line of steamers where it would not pay a private company ?—I have no doubt that if they could establish through booking, and regular daily services, it would be.

3974. (*Mr. Hamilton.*) Is there any difficulty in the way of through booking, as between Waterford and Wales, now ?—I am not aware that there is.

3975. (*Mr. Horsfall.*) Can you mention any place where it would be advantageous to establish steamers in connexion with a railway company, where they do not now exist ?—They do exist, but they are not carried out in a broad way. The service between Waterford and Milford is very poor, it is carried on with indifferent boats, it takes a very long time, and it is not a good service. Then the service between Dundalk and Drogheda, and Newry and those ports, is at present all a tidal service, and not at fixed hours, and arrangements such as would enable them to start at fixed hours every day and book through, would be most important to the Irish trade.

3976. (*Mr. Glyn.*) At Dundalk, I believe, the present unsatisfactory state of things is about to be remedied ?—A company is about to carry a line to Grenore. The water will be deep enough to enable the boats to start at fixed hours ; but all these things require capital and combination between the railway and steamboat companies.

3977. (*Mr. Hamilton.*) You have no doubt that it would be beneficial to that part of Ireland if there was a good and efficient service between Waterford and Milford ?—No doubt at all.

3978. (*Mr. Glyn.*) Has not Parliament already granted powers for a railway company to run steamboats to Carlingford Bay ?—The London and North-western Company obtained powers to extend their steamers to Carlingford Bay ; but I believe that that is the only company who have obtained such powers.

3979. (*Sir R. Hill.*) Are there not very good steamers in the north, running between Glasgow and Belfast ?—Yes, there is a fixed service there ; but that is the only port at which there is a fixed service. All the remainder are tidal services.

3980. (*Mr. Dalglish.*) And again from Ardrossan to Belfast ?—Yes ; they have lately at great expense made such improvements at Belfast that they are able to start boats at any fixed hour ; but all the other ports are only tidal ports.

3981. (*Mr. Hamilton.*) Does the want of an efficient service between Waterford and Milford add to the cost of the traffic between the South of Ireland and London, particularly in cattle and meat traffic ?—Yes ; no doubt it adds to the cost, because it increases the time, and besides that it diminishes the traffic ; the traffic flows in other ways.

Mr. G. W. Hemans.

26th May 1865.

3982. (*Chairman.*) You would recommend general powers to be granted to railway companies to establish steamboats wherever they thought proper?—Yes; the object in Ireland being to stimulate the business of the Irish railways, every facility should be afforded for the export trade, which would tend in that direction.

3983. (*Mr. Horsfall.*) Do you think it would be fair to independent steamboat companies already established to grant a monopoly to railway companies to run steamers?—If there was only one railway to each port, and that railway were tied to a particular fleet of steamers to convey their goods, any other fleet would, of course, suffer, and it would then be restricted to the goods from the immediate neighbourhood of the port which did not come by the railway.

3984. It would be natural, would it not, for the railway company to book their passengers and goods through from a distance?—They would undoubtedly agree to do so; but I look upon that as very secondary to the interests of the country at large. If the traffic of the country at large is to be stimulated by these means, I think that the interests of a private steamboat company are very secondary.

3985. (*Mr. Hamilton.*) In the case under consideration between Waterford and Milford there is a steamboat service?—There is a communication. I forget in whose hands it is; but it is not a good one; it is an inefficient communication.

3986. The service is limited to three boats, is it not?—Yes, three poor boats; and I have found them to be perfectly inadequate, most inconvenient, and giving wretched accommodation.

3987. Would you allow the Irish railway companies to put on steamboats?—Yes, if they were prepared to do so.

3988. To run them to America?—Yes, if they had the means to undertake it. I believe that in future intercourse with America, direct from Ireland, will be a very important element in the prosperity of the railways.

3989. (*Mr. Dalglish.*) You say that the steamers between Waterford and Milford are very insufficient; must not that be injurious to the trade of the railway which runs to Milford?—Yes, no doubt of it.

3990. Then there would appear to be no objection, as far as the railway is concerned, to preventing the monopoly which exists in the hands of the steamboat proprietors, and to insist upon their running proper boats on the station, and you would give the railway companies power to put on better boats?—Certainly.

3991. (*Mr. Horsfall.*) But it does not follow that they would do so?—There is every expectation, I think, that they would.

3992. (*Mr. Dalglish.*) You would not give a monopoly to the steamboat proprietors to keep bad boats upon a station?—Certainly not.

3993. (*Chairman.*) Have not the railway companies, wherever they have thought it their interest to establish steamboat communication, taken means to do so indirectly, if they had not the power to do it directly?—I think that various difficulties have prevented them from doing it efficiently; for example, when they know that the shareholders can say, "You are doing an illegal thing," the directors cannot safely venture upon any large speculation of that sort, and if it is done, it is done poorly and feebly.

3994. (*Mr. Glyn.*) I suppose that in the case of Carlingford Bay, unless power had been granted to the London and North-western Company in conjunction with the Irish company, the thing would not have been done at all?—No, I doubt whether it would; in fact it is not done yet. It is to be done as soon as the pier is ready.

3995. (*Capt. Galton.*) The Midland Company have a service of boats from Morecambe to Belfast?—I believe they are interested in that. It is not done in their own name.

3996. They have not power by Act of Parliament to run the boats?—I am not aware of it. It may be so, but what I have stated was more to show that, in my opinion, the stimulation of that cross-channel traffic is very important indeed for the Irish railways generally.

3997. (*Mr. Glyn.*) You would establish a system of booking through?—Certainly; from every port in Ireland to every port in England, if possible.

3998. (*Chairman.*) Is there any through booking, except through Dublin, at the present time?—I am not sure. There may be some through booking in the north, and I have no doubt there is.

3999. Not by Waterford?—Yes, I believe there is through booking by Waterford, but the service is not good enough to make it popular.

4000. There is a very short practicable passage in the south of Ireland from Wexford or Carnsore to Fishguard?—There might be, if a proper harbour was made, a short passage across there.

4001. Has not a railway been started to Carnsore?—It is not, I believe, made, and indeed I know nothing about its present state, whether they have got to work or whether a contractor has been found to undertake it; it must be a work of some years.

4002. (*Mr. Hamilton.*) Have you calculated the difference in point of time, supposing there was a good sea service between Waterford and Milford, comparing a journey from London to the south of Ireland with the route round by Holyhead and Dublin?—The distances from Waterford to London by Milford and from Dublin to London by Holyhead, are, within a few miles, the same; going round by Dublin would be just the distance from Dublin to Waterford, and the disadvantage would be by that distance. I think that the distance is about 100 miles.

4003. If the sea service was good between Waterford and Milford, would there not be a large passenger traffic by that route?—I have no doubt of it.

4004. (*Chairman.*) The steamboat passage must be, at all events, four or five hours longer from Waterford than going by Holyhead?—No, I think it need not be four or five hours longer; at the present time it is so; it is about nine hours now.

4005. The distance does not make that difference in time necessary?—Not so much as that; the other is from four and a half hours to five, and this is nine; if the time was reduced to seven the difference would be much less.

4006. (*Mr. Hamilton.*) Do you know what the difference is in the sea routes?—At present it is represented by nine hours against four and a half.

4007. (*Chairman.*) The fast boats running between Kingstown and Holyhead are only adapted for passenger traffic, are they?—There is no physical reason why they should not take goods; but it would not suit their arrangements to carry goods.

4008. (*Mr. Hamilton.*) Is not that a subsidized service?—Yes.

4009. Therefore there is no prospect of getting boats of the same calibre between Waterford and Milford?—One would hardly expect them to be able to get boats of equal power and speed to those running between Kingstown and Holyhead without assistance, but very much better boats than there are now between Waterford and Milford might be put on.

4010. (*Chairman.*) Is there any other point to which you would like to call the attention of the Commissioners?—No.

4010*. I believe we have to thank you for the cartoon map of the Irish railways, which has been very useful to the Commission?—It is quite at your service.

The witness withdrew.

Adjourned to Tuesday next at 12 o'clock.

Tuesday, 30th May 1865.

PRESENT:

The Right Hon. Lord Stanley, M.P., F.R.S.
The Hon. E. F. Leveson Gower, M.P.
The Right Hon. Robert Lowe, M.P.
Sir Rowland Hill, K.C.B., F.R.S.
T. B. Horsfall, Esq., M.P.
Robert Dalglish, Esq., M.P.
Geo. Carr Glyn, Esq., M.P.
A. T. Ayrton, Esq., M.P.
Capt. Douglas Galton, R.E., F.R.S.
E. T. Hamilton, Esq.
J. R. M'Clean, Esq., Pres. Inst. C.E.
William Pole, Esq., F.R.S., *Secretary.*

His Grace THE DUKE OF DEVONSHIRE, K.G., F.R.S., in the Chair.

Mr. John Ennis, M.P., examined.

Mr. J. Ennis.
30th May 1865.

4011. (*Chairman.*) You are Chairman of the Midland Great Western railway of Ireland?—Yes.

4012. Have you been connected with that railway for many years?—I have been connected with it for 20 years, and I was the originator of it.

4013. Have you paid much attention to the affairs of the company since its establishment?—Yes, invariably, excepting for two or three years, when I was abroad.

4014. Has the question of the fares and charges on the Midland railway often been the subject of discussion at your board?—It has been so.

4015. Have you ever considered the policy of trying a lower scale of fares and charges than those which are now made?—That question has constantly been submitted to me by our late manager, Mr. Forbes, who suggested to us that it would be a wise thing to reduce our third-class fares; but I must say at the same time that for many years during his management of the Midland system he was very much opposed to anything like a reduction. He agreed with me in the view that traffic in Ireland is a limited quantity, and do as you might in the way of reduction, you would not be able to arrive at anything like a compensating receipt in money.

4016. Have any experiments of the kind upon any occasion been tried on the Great Midland railway?—Not as experiments, but our fares are particularly low; for instance, with regard to harvest labourers, of whom we carried 70,000 last year backwards and forwards to Dublin on their way to England, we have carried them for about a halfpenny a mile, and having done that we thought we had gone as far in the way of reduction as it was possible or profitable to go. I have always felt that there are two views to be taken of this question. If a board of management is prepared to make a great sacrifice for three, or four, or five years, it is possible, that they will arrive at a more satisfactory result than is now obtained; but the shareholders will not consent to go without their dividends during that time for a problematical advantage.

4017. Is it your opinion, that in the course of four or five years, if a large reduction of fares was tried, in all probability the railway receipts would recover themselves?—It is.

4018. Has the system of carrying the harvest labourers at the low fares which you have mentioned been tried for many years?—It has been tried for several years, and notwithstanding the very low rate which is charged, and which I am sure every member of the Commission will acknowledge to be a very low one, we do not carry anything like the number that are passing and repassing. I have often seen men walking past my demesne gates in clusters of 20 or 30. It used to be their practice to hire one of the cars of the country, and take it for 8 or 10 miles, 20* men being carried on the car, their places being taken in turn by 20* others. The party consisting, perhaps, of 40 who would probably share in turns the rest that would thus be afforded them.

4019. (*Capt. Galton.*) What would they have to pay for the car?—1*s.*†

4020. Only 1*s.* for so large a number for a distance of 10 miles?—The charge is for the car, and they use that according to their own state of weariness; they would, as they call it in Ireland, ride in tye.

4021. (*Mr. Glyn.*) And the distance would be 10 miles?—Ten Irish miles. I think the owner would lead his horse.

4022. (*Capt. Galton.*) You mean 1*s.* for the car, and not 1*s.* per head?—No; probably it would be 2*s.** for the venture.

4023. To take them 10 Irish miles?—Yes, I have known that done.

4024. At the present time do you believe it is possible to get a car so cheaply as that?—No, I do not speak of the present time; but I speak from my own observation of people whom I have seen passing my gate. I live in a lonesome part of the country; very few people live there, and I do not see the same state of things that I used to see. Notwithstanding the halfpenny fare that we charge—for instance, 5*s.* from Dublin to Galway, a distance of 126 miles—our manager tells me that we are not getting all that class of agricultural labourers to go by the railway.

4025. It would not be worth your while to charge such low fares as are charged on some of the lines for excursion trains in England, when people are carried for the same distance for half-a-crown?—No; I think not.

4026. (*Lord Stanley.*) The success of the excursion traffic depends, does it not, upon the density of the population?—Clearly so.

4027. (*Mr. Horsfall.*) Are you aware that low fares have been tried as an experiment on the Londonderry and Coleraine line?—No, I am not; I thought that our fares in Ireland were pretty nearly uniform; and, indeed, with regard not only to passenger fares, but to the carriage of goods, I think we generally agree at our clearing house upon a certain rate, and I think we adhere to that, except under special circumstances, as closely as we can.

4028. (*Mr. Glyn.*) That railway fell into the hands of the Exchequer Loan Commissioners; they have leased it, and probably that was the cause?—Yes; where a railway is subsidized, as in the case of the Belgian and Dutch Rhenish railways, low fares can be introduced and be persevered in, because the shareholders do not suffer by the system.

4029. (*Chairman.*) What are your third-class passenger fares at other times of the year, when the harvest men are not travelling?—I have been speaking of exceptional fares, the harvest men's fares; but I wish to speak of them in connection with the state of the country, which I think ought not to be lost sight of. The fare for a third-class passenger is a halfpenny and one-tenth per mile.

4030. (*Capt. Galton.*) Is not that in excess of the charge authorized by Act of Parliament?—I think not.

4031. Is it not a halfpenny a mile by the Act of Parliament?—I think not. I think that we could not very well charge more than the Act of Parliament authorizes. We run a Parliamentary train, which probably meets the requirements of the Act. The Parliamentary train is a penny, and that is the maximum.

4032. How many Parliamentary trains in a day do you run; one each way?—Yes; I think so.

4033. With respect to the harvest-men traffic, do you carry them in the ordinary trains?—Yes.

* These numbers were afterwards altered by the witness to "10."

† This sum was afterwards altered by the witness to "3*s.* or 4*s.*"

* This sum was afterwards altered by the witness to "4*s.*"

Mr. J. Ennis.
30th May 1865.

4034. It does not occasion you any extra expense to carry them beyond running a carriage ?—When a very large number of these men arrive by boat in the morning at Dublin, they are not the most orderly people in the world, and they are very anxious to get home to their several residences, and in that case we frequently send them on special, if there are 500, or 600, or 700 of them. They would so interfere with the action of our ordinary trains, that we do in those cases send them on special.

4035. If you sent 500 or 600 of them, would it not be very remunerative to you to carry them for half-price, at which rate you would be charging 5*s.* as between Galway and Dublin ?—Yes. If we had every day 500 of these men on their way to Dublin proceeding to England, or if we carried 70,000 both ways, which would be 35,000 each way, and we had 35,000 to carry every week or every day, it would make a very serious difference.

4036. (*Chairman.*) Are the third-class passengers at all times of the year very limited in number ?—No. Our third-class passengers for the half year ending December 1864, were 161,953 ; the largest number of our first-class passengers, was 65,600 ; of second-class passengers, 140,300 ; by the Parliamentary train, 136,000 ; while the harvest men were about 60,000.

4037. (*Mr. Glyn.*) Does that show a decrease by comparison with the preceding years ?—I cannot state, for I have not the figures here.

4038. Do you think it does show a decrease ?—No. I have had occasion to remark of late years that our third-class passengers have been steadily increasing.

4039. To what circumstance do you attribute that ?—That I think is to be attributed, to some extent at least, to the emigration that is going on, and which has been going on in Ireland, for the last three or four years.

4040. (*Mr. Horsfall.*) Has the cattle traffic increased ?—No. It is at a stand still. The falling off in the last half year, as compared with the previous one may be, I think fairly imputed to the scarcity of cattle in the country, I think very fairly.

4041. You do not think that any reduction of fares would increase the traffic ?—No, I do not. Take for an example the great fair at Ballinasloe, which attracts so much public attention, I believe that our rates and fares are considered so reasonable there, that everybody is pressing us to take away their cattle in priority; but really our rolling stock is not sufficient for the operation, and I do not think as a general principle, that our rates charged for cattle, ought to be complained of. We have lately made a small reduction which may tell. Among those who send cattle to the Dublin market extensively are some who have probably what are called resting farms between Dublin and their residences. I reside 66 miles from Dublin, and I have farms where I rest my cattle. I sometimes send them by rail, and sometimes drive them.

4042. (*Capt. Galton.*) If the rates were lower, would it not be worth your while to send them by railway ?—No ; my steward tells me that it is better they should rest on the road.

4043. (*Mr. Glyn.*) Do you speak of fat cattle ?—Yes.

4044. (*Capt. Galton.*) In England the cattle are generally sent by railway; the farmers seem to prefer it ?—Yes; they go from the farmer to the market, but if the farmer had places on the road where he could rest the cattle, I doubt whether he would find it to his interest to send them by railway.

4045. (*Mr. Glyn.*) How many miles a day do you you drive your cattle ?—From my farmyard, to the Dublin market, it would take five days ; that is for a distance of about 66 miles. But when I send this way, my cattle go a little out of their way for accommodation sake.

4046. (*Mr. Horsfall.*) Seeing that these intermediate farms can be kept up only at a certain expense, might not a reduction of the fares induce you to send the cattle by railway ?—Not if the question means to suggest that I should relinquish my farms and let them to other people.

4047. I presume you do not keep farms for the purpose of resting the cattle ?—Not for that specific purpose, but I am enabled to make use of them for that purpose.

4048. (*Mr. Glyn.*) But that practice could apply only to very few persons ?—Very few.

4049. Do the fat cattle generally go by railway?—Yes ; almost invariably.

4050. You would not say the same thing as to the store cattle ?—No.

4051. Would not a reduction in the rates charged bring them on to the railway?—Yes ; the natural result of low rates would, of course, be to superinduce trade. But would it pay ? that is the question.

4052. That must depend upon the quantity. We have been informed that a large number of store cattle do travel by the roads that might be brought on to the railways if lower rates were charged ?—I think there would be some addition, but I do not at the same time think that the addition would outweigh the disadvantages of a very serious reduction in the fares.

4053. (*Capt. Galton.*) How far is the nearest of your farms from Dublin ?—18 miles.

4054. Are your fat cattle driven 18 miles into the Dublin market and then sold ?—No ; they are driven only for a distance of about seven miles to my Dublin agent's place.

4055. They remain there for a day or two, I suppose to rest ?—They remain a night.

4056. (*Mr. Horsfall.*) Do you not find the fat cattle decrease in value by being driven that distance? —No. Many experienced graziers say that they are the better for being walked a little into the market rather than when they are turned out of a railway truck, in which they generally get bruised, and sustain all sorts of injuries. Nothing is more common than to see in the Dublin markets, cattle bruised when exposed for sale, after being brought in by railway.

4057. (*Lord Stanley.*) Do you say that the injuries which they sustain in a railway truck are comparable to the wear and tear consequent upon their being driven along the road ?—No, I do not go that length.

4058. (*Chairman.*) At what time of the year do you send your fat cattle to market ?—In the winter time.

4059. They could not, I suppose, be driven the same distance in the summer time ?—No.

4060. (*Mr. Hamilton.*) Are there facilities all along the line for putting the cattle into trucks at every station ?—Yes, at every station. We receive and deliver cattle at every station, with the exception of one or two.

4061. (*Chairman.*) Do you carry much store cattle by the rail ?—A great quantity.

4062. But a large quantity also travels in the same direction by road ?—Unquestionably.

4063. (*Capt. Galton.*) Is not the quantity of store cattle that you carry regulated by the number of trucks that you possess ?—Yes, at Ballinasloe fair, where a larger number of store cattle present themselves. At any other fair, and there are many of them in Ireland, our appliances are very ample for the purpose. But I am very willing to admit that we do not get all the cattle to carry that are sold in those fairs ; at least, that is what our manager informs us, and that is what I heard also from gentlemen who are in the habit of attending those places.

4064. (*Mr. Horsfall.*) Can you state what proportion of the cattle does travel by railway compared with those that travel by road ?—I could not venture to give even an approximation to that.

4065. (*Chairman.*) Have you formed any opinion as to what proportion of the whole cattle in the country should travel in a year, either as fat cattle to market, or to be removed from one farm to another ? —No.

4066. (*Mr. Hamilton.*) I thought you stated that the traffic was a limited quantity, and that there was

no prospect of increasing it by reducing the fares ?—Quite so ; I did say that the traffic, in my opinion, was a limited quantity, but I said so more with reference to any prospect of any large money increase by reason of very largely reduced fares. I think the traffic is a limited quantity ; at the same time I am quite willing to admit that of that limited quantity we, on the Midland system, do not carry all that is to to be carried.

4067. (*Lord Stanley.*) You would, I presume, expect to carry more if a reduction were made, but not so much as to compensate you for the pecuniary loss you would sustain ?—Yes.

4068. (*Mr. Glyn.*) You would have to increase your plant in that case, and you think, upon the whole, that it would not pay you better than at the present time ?—I think that we should make very great exertions to do the service of the country, as far as possible, but there are some people, who, if you offered them to carry their cattle at a minimum price would prefer to drive them along the road ; men to whom time is of no moment. And the same remark may be made as to passengers ; I have sometimes thought that if we were to carry a man from Galway to Dublin for nothing, what would he be doing in Dublin ? He has no occasion to go there, no pleasure to seek, no business to transact, and, without seeking to jest, we should be almost obliged to give him his breakfast and dinner into the bargain.

4069. (*Mr. Hamilton.*) I do not understand from your evidence that your railway appliances are deficient, except at particular points of your system, and on particular occasions ?—I have mentioned Ballinasloe as the only point where anything like a deficiency is felt ; but it must be remembered, that that is an enormous fair, and it would require appliances on the largest possible scale to meet the demand.

4070. You could not carry a great deal more than you do?—Yes we could; our receipts vary from 7,000*l.* to 8,000*l.* at that fair in October.

4071. (*Chairman.*) Do you ever borrow rolling stock from other railway companies ?—Yes.

4072. (*Mr. Ayrton.*) Has the number of labourers which you have carried at a halfpenny a mile increased in the last few years ?—The harvest labourers have increased in numbers. These poor people from the west find their way to some market for their labour ; they can hardly get a shilling in Ireland, and naturally they will go to places where they may get many shillings.

4073. Can you state how many you carried about 10 years ago, as compared with the number which you carry now ?—I am afraid I cannot accurately do so; I have three half-yearly returns before me, and there is a very insensible difference, at least dealing with such large figures. I find that up to December 1863, we carried 85,200 harvest labourers ; up to June 1864 we carried 83,000 ; and up to December 1864 we carried 88,000, so that the numbers are not very different.

4074. (*Chairman.*) Do the harvest labourers put off their return homewards to as late as December ?—Yes, they put it off as long as there is any chance of money to be got in England.

4075. (*Sir R. Hill.*) Were the numbers you have given carried in the particular months you have mentioned ?—No ; in the half years.

4076. (*Capt. Galton.*) How do you accommodate these harvest men ; do you carry them in the ordinary third-class carriages ?—Yes.

4077. How many will an ordinary third-class carriage accommodate ?—I should think 40 or 45.

4078. Then I suppose you simply add to any Parliamentary train two or three additional carriages ?—No, we do not like doing that, because there is great detention caused by it. These men get out at the various stations ; they will do it, and there is more or less noise and detention, and therefore we do not like carrying them, and never do, with a fast train.

4079. Why not ?—For the reason I have just given you, that they will get out of the train, and then it is very difficult to get them in again, and therefore the train is detained ; but on some occasions, and they are not very few, we send them by a special train.

4080. If you got as much as 4*s.* a mile, I suppose it would pay you ?—Yes.

4081. If you carried 170 of those men at a farthing a mile, it would be a paying rate, would it not ?—That would be 2*s.* 6*d.* for 120 miles, and I doubt whether it would be a paying rate. At the same time I think it is only fair to say that it has been recommended to us, that we should carry people at that rate.

4082. (*Mr. Ayrton.*) Did you not formerly carry them cheaper than you do now ?—No ; at the recommendation of our manager, Mr. Forbes, we in the year 1860, advanced our passenger fares 10 per cent.

4083. (*Capt. Galton.*) On all classes of passengers ?—Yes ; and I think I have Mr. Forbes's note. He stated in a note, dated 17th July 1860, "I beg to "suggest for the consideration of the directors, whether "it is not desirable at once to revise our scale of passen-"ger fares. The accommodation given on this line is "at least equal to that afforded by the Great Southern "and Western Railway company, whose fares are 10 "per cent. higher than ours." On the receipt of that letter in July 1860, we raised our fares ; the fares of the first and second-class passengers were to be raised 10 per cent. higher than the then present rates, and a full penny a mile, was to be charged for passengers going by Parliamentary trains.

4084. (*Mr. Glyn.*) What was the effect of that alteration ?—The effect was to increase considerably our receipts.

4085. Was there any great diminution in the number of the passengers ?—I am afraid that I have not any data of so anterior a date as July 1860 to enable me to answer that question.

4086. (*Mr. Ayrton.*) Have you received applications from any other class of working people to have the advantage of the harvest labourers train extended to them, or that they might have the benefit of the same rate ?—No. We issued return tickets from market town to market town at very reasonable rates indeed. If the question refers to that fact I can say that applications were made to us from time to time and we met those applications by giving return tickets from town to town at a reduced rate.

4087. (*Chairman.*) Did any considerable number of passengers avail themselves of those return tickets on market days ?—Yes.

4088. Which are the principal market towns on your line ?—Mullingar, Boyle, Longford, Carrick, and Athlone.

4089. How do you distinguish the harvest passengers from the other passengers ? At the time you are conveying the harvest passengers do not other labourers or other persons present themselves desiring to be carried at the same low rate ?—We treat any persons who will travel by those fourth-class trains that we start in the same way; if a man in a blue coat chooses to come we will carry him.

4090. Do you also carry women and children by those trains ?—No.

4091. Not if they present themselves asking to be carried at those low fares ?—If they did come and ask us I do not think we could or should refuse them, but in fact and in practice they never do.

4092. (*Mr. Horsfall.*) I suppose they are all through passengers ?—Yes.

4093. (*Mr. Glyn.*) You issue a particular description of ticket ?—Yes ; called the harvest ticket.

4094. (*Mr. Ayrton.*) Did Mr. Forbes change his opinion upon the subject of the rates after the period to which you have alluded ?—No ; he partook very much of my view ; that we were getting practically all the traffic that we could get at a fair paying rate. I have read his evidence, and I am afraid I must state, as I have already stated, that it was upon his recommendation we advanced our fares ; and so far from his being an advocate for lowering them, I have a copy of a letter of his, in which he presses upon me the expediency of advancing our fares ; and that was

Mr. J. Ennis.
30th May 1865.

done after he had three or four years experience of the working of our line.

4095. (*Mr. Horsfall.*) What is the date of that letter?—19th July 1860.

4096. (*Sir R. Hill.*) You have stated that the immediate effect of advancing the fares was to increase your revenue?—Yes.

4097. Can you state what the ultimate effect, or what the more remote effect was?—If I am justified in attributing the then existing state of things to the fact of our having advanced our fares in 1860, I am sorry to be obliged to admit that within the last half year our revenue has fallen off; it has decreased considerably. I ascribe that to the impoverished state of the country, and particularly of the towns.

4098. Is the country more impoverished now than it was in 1860?—Unquestionably so.

4099. (*Lord Stanley.*) In consequence of the three bad years that followed?—Yes; and in consequence of the quantity of land that has been thrown out of cultivation, particularly in the west of Ireland.

4100. (*Mr. Horsfall.*) In your opinion, would the railway companies in Ireland be benefited by a general amalgamation?—Is what is meant an amalgamation under Government superintendence, or the simple amalgamation of one company with another?

4101. Would either of those systems confer a benefit on the country?—I should like to see it tried. It stands to reason that if you diminish the expenditure for management, railway staff, and those things, you will gain something. Whether it can be carried out with facility in Ireland is another part of the question. But I should like to see it tried there. I have had such instructive experience of the trouble and difficulty of managing a moderate concern like ours, extending only over 337 miles, that I should be very glad to see such an amalgamation carried out as is alluded to.

4102. (*Mr. Glyn.*) Is your system an entire system; or are there some small companies which do not belong to you?—I can answer the question critically. I should say that our system proper is 245 miles; that is, from Dublin to Galway, and from Dublin to Sligo.

4103. What independent companies are there?—There is a small independent line of 15 miles in length from Athenry to Tuam, which is worked by the Midland company; we rented it for a sum of 4,000*l.* a year, and I think our loss upon it has been about 2,000*l.* per annum.

4104. You have the regulation of the rates and fares charged upon it?—Yes; then the Great Northern system is 71 miles long, from Athlone to Castlebar; and it is now being carried down to Westport. We do the haulage of the line, and also regulate the fares; that is to say, by an understanding with the promoters.

4105. (*Mr. Horsfall.*) Have you an equal mileage rate over the whole of your line?—Yes.

4106. (*Mr. Ayrton.*) We have been informed that the inhabitants of Galway could give you a guarantee as to that part of the line between Athlone and Galway, and that they have repeatedly remonstrated with the directors against the excessive rates of charge, stating that they were anxious to have a reduction, and that they would accept any responsibility that would fall upon them for any loss that might ensue. Are you aware of those circumstances?—I apprehend that the Honourable Member is alluding to a statement that was made by Mr. Monsell in the House of Commons, and to which I replied at the time.

4107. No. What I have referred to was stated by a witness who was examined before the Commission?—The only application of that kind that I have ever heard of was made by Lord Clancarty, who was a director of the Midland railway. He was so full of the notion that low fares would bring largely increased business, that he proposed to his brother directors to try a reduction as between Galway and Athlone, and with a great deal of patriotism and belief in the truth of his system, he proposed to guarantee us against any loss by reason of the trial. The proposal was considered, but the difficulty then arose what should we do with the rates over the rest of our system, because we could not have differential rates, and we were obliged to decline it. With that exception, there has never been any application made to me officially by any persons in Galway for reduced rates.

4108. (*Mr. Glyn.*) Could you not have tried the local rates as differential rates?—We could have tried them certainly, there is no doubt about that; but I was very much disinclined to meddle in the matter under an exceptional state of affairs as between the Company and Galway, where they found that it was very onerous upon them to make good the deficiencies every half year of 3,000*l.* or 4,000*l.*, under the Act of 1849, and I thought it would be hardly right under those circumstances, to make an exception with them, and at the same time expose ourselves to be attacked by people living upon every part of the line who would have asked us to do the same thing.

4109. It was therefore declined?—Yes.

4110. You have just referred to the Act of 1849; what was that Act?—That was the Loan Act. Sir Charles Wood concluded an arrangement with the Midland company, by which a sum of 500,000*l.* was to be advanced to be laid out in the western districts of Ireland, but it was more for the sake of giving employment to the people at a period of great distress, than benefiting the railway; so much so that I refused it at the time; I said the money was not worth having at the price, and unfortunately my words have come true.

4111. (*Mr. Horsfall.*) Did Lord Clancarty's proposal extend to goods as well as to passengers?—I do not say that that is what he said, but I suppose he intended that.

4112. (*Mr. Ayrton.*) Did the Grand Jury of Galway come to any resolution upon the subject?—Not to my knowledge. On the contrary, the Grand Jury have been very anxious to get rid of the operation of the Act of 1849, and to relieve themselves from the payment every half year of from 3,000*l.* to 4,000*l.*

4113. Was it not suggested that they might get rid of that responsibility by your company reducing the rates from Athlone to Galway?—I have never heard of that.

4114. (*Mr. Hamilton.*) What plea have the Grand Jury put forward as the ground for releasing themselves from that payment of from 3,000*l.* to 4,000*l.* a year?—The plea was, the arrangement entered into by them in the year 1857, I think, with the promoters of the Great Northern line from Athlone to Castlebar and Westport. The county gentlemen of Galway opposed the bill, because, they said, "It taps "our traffic completely, and it renders our Athenry "station useless, and as we are accountable for all "deficiencies between the payment of the interest "upon the Government loan and the net receipts of "the line, we will require you to release us from our "liability if you encourage a line which is otherwise "an advantage to you, but which involves very "serious consequences and losses to us." We entered into that arrangement limiting it to a certain period, and it was only the other day that an arrangement was finally entered into, by which the Midland company, in consequence of the part we have taken as shareholders in the Westport line, and in consequence of the large amount of traffic it brings to our system at Athlone, have consented after 1870 to release the baronies in the county of Galway from any liability under the Act of 1849.

4115. (*Mr. Hamilton.*) The plea which they put forward was not that they had not received the advantage which they expected owing to the high rates imposed by the directors of the railway?—Certainly; the plea was, that an interference with their traffic would be caused by reason of the construction of the Great Northern line.

4116. (*Mr. Ayrton.*) They considered that the construction of any competitive line released them from

the obligation to give a guarantee?—That was the effect of their plea.

4117. (*Capt. Galton.*) I observe in the Board of Trade returns of the traffic on your line that, while there has been an increase in most of the articles carried, there has been a great falling off in the receipts from coal and coke. In 1861 the number of trains of coal and coke was 19,000, and the number in 1863 was 11,000; the amount received in 1861 being 4,500*l.*, and in 1863 only 2,000*l.*; to what do you attribute that difference?—With regard to the question generally, I should say that where there has been a comparatively large increase in the money received for the carriage of coals it must have been from the season having been very wet and turf not to be had. Take my own case, I use turf in preference to coal; I like it better; and I can get coal delivered at my house for about 20*s.* or 21*s.* a ton.

4118. (*Mr. Ayrton.*) Do you live near Athlone?—Moate is my station; the coal is carried for three farthings a ton per mile.

4119. (*Capt. Galton.*) Was the year 1861 a very wet year?—I think that 1861, 1862, and 1863, were bad years; I am sure of it. By a bad year, in Ireland, we mean a very wet year.

4120. I observe that the receipts from coal and coke, which, in 1861, were 4,500*l.*, and in 1862, 4,800*l.*, fell, in 1863, to 2,000*l.*?—Yes.

4121. I understand that in a wet year you require coal for consumption?—Yes; because we cannot get turf.

4122. 1862 having been a wet year, one would have thought that the coal would have increased in 1863, but instead of that it appears to have diminished?—Yes; except that the return may have referred to a bygone period.

4123. In the evidence of Mr. Forbes he was asked, at question 1849, "Have you ever urged upon the "directors of the railways with which you have "been connected the policy of trying the effect of a "reduction of the rates upon coal especially?—Yes; "when I joined them I found that the rate was about "1¼*d.* per ton per mile, and I recommended them to "reduce it to ½*d.*, but I induced them eventually to "reduce it to ¾*d.* What was the effect of reducing "it from 1¼*d.* to ¾*d.*?—That the traffic was increased, "I think, about 25 per cent. That was attended "with loss probably?—No, I think not; the reduc-"tion that was made was not sufficient to create "any loss. I think that anything short of ½*d.* a "ton per mile would not be of the least use. (*Mr.* "*Ayrton.*) Upon what calculation is that opinion "of yours based?—It is based upon this, that at a "rate of ½*d.* a ton per mile you can deliver coals "into all the principal towns in Ireland for about "16*s.* or 17*s.* a ton; and I believe that for mere "domestic purposes it would entirely supersede the "use of turf." Do you dissent from that opinion?—Yes; if Mr. Forbes means to say that by reducing the rate upon coal to a halfpenny a ton he could deliver that coal into all parts of Ireland for 16*s.* or 17*s.* a ton, what becomes of the fact that we pay 16*s.* and 17*s.* for our coal in Dublin?

4124. Is the coal delivered at Dublin at that price?—The coal is delivered at the quays opposite the Custom House in Dublin, and the price is 16*s.* a ton.

4125. Delivered from the ship?—Yes, including the carriage.

4126. (*Sir R. Hill.*) Can you say what the price would be at the quay?—I make a contract generally speaking with a man who supplies the Bank of Ireland, and I think that my contract in the last year was 16*s.* or 15*s.* 9*d.*, I do not know which.

4127. (*Mr. Glyn.*) Was it laid down at that price?—Yes.

4128. (*Sir R. Hill.*) At the quay do you mean?—No; at my house in Merrion Square.

4129. What is the price charged for the carriage?—I suppose it is 1*s.* 6*d.*

4130. Then the price at the quay would be about 14*s.* 6*d.* or 15*s.*?—Yes, or something less.

4131. (*Capt. Galton.*) Are there facilities for unloading the coal on the quays at Dublin? Any steam machinery?—There is no steam machinery.

4132. (*Mr. Glyn.*) Then there is the cartage also to be paid for from the ship to the railway station in Dublin?—Certainly; and I think that the cartage up to the Bank of Ireland, or to my house, is about the same. It is probably 1*s.* 6*d.* at the outside.

4133. (*Mr. Ayrton.*) Then you would have to pay cartage from the railway station in the country to where you live?—Yes, and that is a very serious thing. To say that coals can be delivered in the country at 17*s.* a ton by reason of our charging a halfpenny a ton per mile is a fallacy.

4134. It would also have to bear the charge of the local dealer who sold it at the railway station?—We have endeavoured to encourage local dealers in coal. We have done all that we could to do so, but we find that we cannot compete in an ordinarily good year with turf. It is suited to the habits of the people, and their appliances are in keeping with its use. I do not think that if the rate was reduced to a halfpenny a ton, it would encourage very much a proportionate increase of the consumption.

4135. (*Capt. Galton.*) Do you remember Mr. Forbes making that suggestion to you?—He may have done so, but I do not remember it. Three farthings a ton we have acted upon.

4136. (*Mr. Ayrton.*) Can you give us in coal the exact equivalent to a ton of turf?—I cannot; but I know that I should have my house and gardens supplied with fuel much cheaper if I used coal instead of turf.

4137. At what price should coal be to make it cheaper?—I pay a man 25*l.* a-year for cutting my own turf and saving it, and then I have to cart it, and that 25*l.* worth of turf does not last me from September till March.

4138. (*Lord Stanley.*) Does not the price depend very much upon the wetness or dryness of the season?—In a wet season you get no turf, it is not worth anything.

4139. (*Capt. Galton.*) Did you say that in Dublin you paid 15*s.* 6*d.* a ton for coal?—Not delivered. I think my contract was 16*s.*, certainly not higher.

4140. Of that 1*s.* 6*d.* would be for carting?—Yes, of the 16*s.*

4141. Which would make the price 14*s.* 6*d.* at the quay?—Yes, landed.

4142. Then it might be delivered, if carried at a halfpenny a ton, within 60 miles of Dublin for 17*s.*?—There would still be the cartage to pay for from the depôt.

4143. I think Mr. Forbes stated that in order to enable it to be delivered at that price it would be necessary that the rails should run down to the side of the wharf where the coal was brought on shore?—Our Liffey branch is carried down to the quay, but not to the edge of the water; and if a vessel discharged the coal alongside the quay wall, necessarily there would be the cartage across the quay and loading into our trucks.

4144. Is it impossible to lay down rails on the quays?—They are thinking of doing that; and I believe the Ballast Board have had a bill before the House this session to enable them to lay tramways along the quays with sidings.

4145. Then the coal could be at once put into the trucks?—Yes; except I think that there will not be any coal wharves. I think it is mostly the place where the steamers lie, and it would be very inconvenient as regards the public.

4146. (*Mr. Hamilton.*) What price do you pay for coal at your own residence in the country, 60 miles from Dublin?—They are delivered at Broadstone for about 15*s.* 6*d.*, and I pay ¾*d.* a ton a mile, which for 68 miles is 4*s.* 3*d.*, making 19*s.* 6*d.*; then I have to pay for cartage for four and a half miles.

Mr. J. Ennis.

30th May 1865.

4147. Making up altogether perhaps 1*l.* 1*s.* a ton?—Putting what charge you please for a man's own carts.

4148. (*Sir R. Hill.*) Still I understood you to say that you would save by substituting coal for turf?—It would be cheaper for me; but then I take into consideration the enormous waste that there is; if I burned nothing but coal, it would be a saving to me, even at the present high rate.

4149. *A fortiori* you would save if the rate upon the coal was reduced to a halfpenny a ton?—Yes; if I allowed opinion and fancy to enter into my calculation, I should prefer coal at 40*s.* a ton to turf at 1*l.*, although, economically speaking, I am quite satisfied I should be wrong.

4150. Would not the economical view of the question be that which would influence the greater number of consumers?—I should say so.

4151. According to your view, if the consumers looked simply to the cost of the fuel, they would, even at the present rates charged for conveyance, use coal rather than turf?—True; but we must bestow a thought upon those who are the consumers, the masses. The masses have not the appliances; they have not the grates in which they could burn turf or coal respectively; their dwellings would have to be re-arranged. Persons of a certain class would find it more economical to do the one rather than the other; the great masses of the people would not know how to burn coal, and you could not convince them that they would effect any saving by it. Then there is an additional question to be considered; that they would not be in a position to buy any quantity, or to cart it home. We have to deal with people who are very poor, and who cannot take advantage of economical operations.

4152. (*Mr. Ayrton.*) Are the cottages provided with hearths rather than with grates to burn coals in?—Yes; in the cottages in the interior there are no such things as grates. Gentlemen who build cottages for their tenants put these things in very nicely, but the great masses of the people have no such things provided.

4153. (*Mr. Hamilton.*) Upon your line what number of tons do you consider a full train load?—We sometimes carry as a load 40 trucks and waggons; we have carried as many as 40 and 50 trucks. The weight of a truck loaded will be at least nine tons.

4154. (*Chairman.*) Including the weight of the truck itself?—Yes.

4155. (*Sir R. Hill.*) What is the weight of the contents of a truck?—The average weight I suppose is five tons.

4156. (*Mr. Hamilton.*) What is the maximum number of tons of goods that you would carry?—That is a question I cannot answer.

4157. What is the maximum quantity of coals that you could take along your line?—I should think, looking at our appliances, that we could take any quantity.

4158. With one locomotive, what is the maximum quantity of coals that you could take in one train?—We could take four tons of coal in a waggon; I suppose we ought to be able to draw at all events from 30 to 35 waggons, and that would be 120 tons. But trade in coal is a thing that does not exist.

4159. (*Mr. Glyn.*) Do you mean that the quantity required is so small?—Yes; and the use of it is so opposed to the habits of the people.

4160. (*Mr. Ayrton.*) Can you give the Committee a statement of the leading items of goods which are carried on your line?—I hardly know how to name them; there are all sorts of groceries, and all sorts of wines and spirits.

4161. Those are the leading articles of the goods traffic?—Those are the articles which would come under the class that would produce the largest amount of receipts.

4162. (*Chairman.*) Do you also carry corn?—Yes; a good deal of corn is carried; but in certain years the corn trade is infinitely better than in others. Last year there was very little Indian corn carried into the country; the corn crop and the oat crop were so exceedingly good that Indian corn was found to be more expensive than oats, and the consequence was, that the import of that article diminished very considerably.

4163. (*Mr. Ayrton.*) Is turf carried upon your line?—Never; it could not be done; it is carried in boats upon the canal; and inasmuch as the Royal Canal, which is owned by the Midland Great Western company, runs almost parallel with our line from Dublin to Mullingar, and from Mullingar to Longford; there is of course an element of competition there.

4164. That railway company holds the canal under their own management, and they work it?—They bought it at the time they made the line; but they are not carriers on it, they merely charge tolls.

4165. They do not interfere with traffic on the canal; that is left to the option of the freighters?—Yes, and private enterprise may charge any rates it pleases. With regard to the Grand Canal, the system is different there, by an arrangement between the Great Southern and Western company and the Midland, the Grand Canal company are empowered to charge from 10 to 15 per cent. lower than the railway companies.

4166. (*Mr. Glyn.*) On the canal that your company hold, the freighters may charge what they please?—Yes.

4167. (*Mr. Ayrton.*) What commodities are chiefly carried on the canal?—Every description of commodity. I have often seen in our docks, under our windows, boats being loaded with soft goods, sugar and articles of that kind, and which one would suppose ought to go by railway.

4168. What charge is made on the canal?—We charge by the tonnage.

4169. The tonnage of the boat?—Yes.

4170. There is no discriminating charge on account of the character of the goods put into the boat?—No.

4171. (*Sir R. Hill.*) They are not carried at your risk?—No.

4172. (*Mr. Ayrton.*) What is the toll charge on the boat?—5*s.* 6*d.* from Dublin to the Shannon.

4173. What is it to Athlone?—The Royal canal does not go to Athlone; it goes to Longford.

4174. Can you state how many miles it is?—I think it is upwards of 90.

4175. Is it a mileage charge that is made?—No; it is 5*s.* 6*d.* a ton for the whole distance.

4176. Is it a mileage rate, or do you charge a sum in gross for the goods taken to Mullingar and other places?—It is a mileage rate based upon the 5*s.* 6*d.* for the entire journey per ton.

4177. Is it *pro rata* for the whole distance?—Yes.

4178. It is a charge per mile throughout the whole length?—No; we charge 5*s.* 6*d.* a ton. Then if the distance be to Mullingar, of course, it would be only half of that; it is so much per ton by the mileage.

4179. Do you know the principle upon which it is computed?—No; it was considerably higher, and when we got possession of the canal we reduced it; it was very considerably higher; I think the Parliamentary licence is much higher than that.

4180. (*Capt. Galton.*) Suppose a boat went for 6 or 8 miles, what would be the charge?—I suppose the tollage would be higher in proportion.

4181. (*Mr. Glyn.*) Did you reduce the rates the moment you became possessed of the canal?—Yes.

4182. Then you established a competition against the railway?—To a certain extent; because our object was to encourage the description of traffic that was peculiarly suited to the canal, such as lumber and coarse goods, for we found that from place to place they were in the habit of carting all those things, and the moment we reduced the rates on the canal we certainly got a very considerably increased amount of traffic; but then the rates were extravagantly high as fixed by Parliament. It was under

an old Irish Act of Parliament, and the rates were ridiculously high.

4183. Then you put the canal in competition with the roads?—Yes; we did that at a time when our railway was under construction; we were the owners of the canal, and it was of course our business to make it as profitable as possible, and to pay our shareholders the interest upon their money pending the making of the railway.

4184. (*Mr. Ayrton.*) Do you obtain an income now equal to the interest which you parted with in the price paid for the canal?—No; and I think I can best answer that question by referring to some facts. In December 1864 we received for rents and tolls and water supply (I should mention that we have a very considerable amount of house property in the neighbourhood of the canal in Dublin) 5,000*l.*, and I will suppose that in another half year it would be 6,000*l.* or 7,000*l.*, take it at 12,000*l.* together. I think that we gave 330,000*l.* for the canal, but then there is to be included in that, to the credit of the company, the facility that this gave them of making a considerable part of the line on the banks of the canal.

4185. Then you have all the expenses to bear of keeping the canal in repair?—Yes; but they are very small. I think it is 2,700*l.* for the half year.

4186. Does the road come into competition at all with the railway now?—No; I have not seen that.

4187. Is the charge you make very much under the charge for cartage by the road?—I think it is. The carting business was formerly a very flourishing one in Ireland, but I think it has disappeared. I do not now see the long strings of carts that, when I was a boy, I saw upon the high roads in Ireland.

4188. Has your company any agreement with any person in Dublin to cart goods from the stations?—Yes, with Mr. Wallace, who receives and delivers goods for us in Dublin; also in Galway, in Sligo, and in Athlone.

4189. Can you state what the relative rates of charge are for cartage and by railway conveyance?—No; I cannot.

4190. (*Mr. Horsfall.*) Although the traffic by the canal has increased, the net profit or the dividends on the canal have not increased?—The traffic by the canal, I think, has not increased. Indeed I know, that in 1863 of the half year ending December, the total traffic produced 6,099*l.*

4191. I was drawing a distinction between the traffic and the money receipts?—I did not intend to say that the traffic on the canal was either one thing or the other, for we have nothing to say to that; we have nothing to do but with our tollage. The quantity of goods carried we know nothing about. I can only say that from the tolls we receive so much, for water supply so much, and from our house rents so much; but as to the traffic on the canal, that is a term that can hardly be applied as to us, because we are not carriers on the canal.

4192. (*Mr. Hamilton.*) But you receive tonnage rates for the goods that are carried upon it?—Yes.

4193. Is not that very much the same as receipts from traffic?—Yes.

4194. (*Mr. Glyn.*) You charge a tonnage upon the boat?—Yes; and the tonnage upon the boat will depend of course upon the quantity carried.

4195. You know nothing about the receipts upon the goods taken by the freighters?—No; they are private undertakers, who, I believe, are not making anything of it.

4196. (*Mr. Horsfall.*) You have stated that the traffic has not materially increased consequent upon the rates being reduced; has the income from the canal been increased by a reduction of the rates?—When I made that statement I alluded to a period of nearly 18 or 19 years ago, when the Midland company obtained possession of the canal; at that time the tolls were very high, extravagantly so, and the first thing which the company did, was to reduce those tolls, and the consequence was immediately a very large increase in the traffic upon the canal.

4197. And an increase in the receipts?—Yes; that state of things continued up to a certain period; but we then found that it did not answer our purpose to be carriers upon the canal, and we thought that we would throw it open to public competition, and be content with our tolls, and our water and house rents.

4198. (*Chairman.*) Are any mines worked in the neighbourhood of your line of railway?—None. An application was made to me some time ago by a man who proposed to work some property belonging to a relative of mine in the county of Leitrim. I should mention that at the head of Lough Allen, there is a canal, and I believe it comes down into the neighbourhood of Carrick, and we offered, as an experiment to carry the minerals for next to nothing in the hope that something might come of it.

4199. (*Capt. Galton.*) What rate did you offer?—It was something extraordinarily low.

4200. (*Chairman.*) What were the minerals?—Ironstone.

4201. (*Capt. Galton.*) Did you offer to carry them at a halfpenny a ton per mile?—It was not so much as that; I cannot give you the precise figures, but the expression I used to the agent was, "I shall carry "your stuff for anything you please to give me, as "an experiment."

4202. What was the result?—They found so many difficulties in getting it to the railway, that it did not come.

4203. (*Mr. Ayrton.*) Have any other applications for special rates been made by persons for the purpose of developing some particular branch of industry?—I do not remember that there have been; but I should be only too glad, not only in the interests of the railway but in the interests of the country at large, to encourage, almost at any cost, the development of anything that might be beneficial to the country.

4204. (*Chairman.*) Is the fish traffic of any importance to your railway?—It is of course an advantage, and we give it all the facilities that we can. The valuable fish we carry by a night train, and the fish that is less valuable, such as hake, and other kinds of coarse fish, we carry at a very low figure; but the Galway fisheries, where one would expect to find plenty of fish, are totally neglected.

4205. (*Sir R. Hill.*) What is the reason of that?—I will endeavour to explain. I had occasion a few nights ago to speak to a gentleman in the House of Commons with regard to an application to the Fishery Board for 2,000*l.* to restore the pier at Buffin in Cleugh Bay, and I said, "Will you join me in the "application? I am told it is a place that swarms with "fish, and if we have a pier there, the fishermen will "have some security, and they will go out." The answer that I received was, "They will not go "out; they pay no attention whatever to the fisheries, "they allow the fish to come and go without making "any effort to catch them." Now it is very hard to say what is the reason of this, but if the fisheries on the west coast of Ireland were developed, the Midland Railway company being in connexion with it, would feel it to be their duty, and their shareholders interest, to afford every facility in the world, and, as in the case of carrying minerals, everything they could do, they would do to facilitate it.

4206. (*Mr. Ayrton.*) Do you regard the Irish people naturally as a seafaring people; or do they dislike going to sea?—No, I do not.

4207. (*Sir R. Hill.*) The unproductive state of the fisheries in the neighbourhood of Galway is not owing to any want of facilities afforded by the railway companies?—Unquestionably not. There is no doubt that railway companies may be sinners to a certain extent, but they are on the other hand very much sinned against.

4208. (*Mr. Ayrton.*) Do you think that if English fishermen went to the west coast of Ireland, they would be able to get on in harmony with the native fishermen?—We know the fact to be, that some years

Mr. J. Ennis.

30th May 1865.

ago a company was established for the purpose of trawling in Galway Bay, and what was the consequence? The fishermen who inhabit a region in the neighbourhood of Galway called Claddagh, turned out against them, and would not allow them to trawl; and the Englishmen very properly went away with their lives.

4209. (*Sir R. Hill.*) They will neither fish themselves, nor allow any one else to fish?—It seems to be so.

4210. (*Chairman.*) You have spoken of an arrangement between the Great Southern and Western and the Midland companies as to some canal; where does that canal run from?—I spoke of the Grand Canal, which passes along here (*pointing to the map*), on to Tullamore and Banagher, and so on with a branch to Ballinasloe, that is the Grand Canal; the Great Southern and Western company with their systems to the west, and the Midland company, after a conflict of considerable duration, have entered into terms by which the Grand Canal company are allowed to carry goods at a differential rate of from 10 to 15 per cent. less than the railways.

4211. Have you any arrangement with the Great Southern and Western company by which steamers are prohibited from plying upon any navigation?—We have not any arrangement prohibiting them from doing anything with their steamers; but when we had a long conflict with the Great Southern and Western on the Shannon, between Athlone and Limerick, we carried our competition so far as to take a man from Dublin, *viâ* Athlone, to Killarney as cheaply as the Great Southern and Western carried him by their line direct to Killarney. We carried passengers all round the river to Limerick, and with the assistance of cars took them to Killarney; but that is now at an end, and at this time there are steamers running between Limerick and Athlone, and I know a gentleman who would be very glad if the steamers called off Scarriff, where he lives.

4212. Are there any other facts that you desire to state to the Commission with reference to your railway?—I have only to add that, in my judgment, if an experiment were to be made of low rates and fares, and which appears to be now the great desideratum, it might be tried; but inevitably it could only be tried at the expense of the existing shareholders,—whether the experiment should extend to one year, or to three or five years, it is impossible to say,—but, looking at the state of the country, and mixed up, as I am, with the people of the country, and taking an interest in most of its industrial pursuits as a director of the bank, besides being connected with railways, I am strongly disposed to assure the Commission that they will find that traffic in Ireland is what I have called it, a limited quantity; and that lower the fares and rates as you please, you will not be able to obtain anything like a countervailing increase in the receipts, as the result of the experiment.

The witness withdrew.

Mr. George Parker Bidder examined.

Mr. G. P. Bidder.

4213. (*Chairman.*) You are a civil engineer of long practice?—Yes.

4214. You are, I believe, chairman of the Great Eastern railway?— I am one of the ordinary directors.

4215. You have been often consulted by railway companies on general financial questions as well as questions relating to engineering?—Yes.

4216. You have paid some attention to the position of Irish railways generally?—Yes.

4217. Have you formed any opinion as to a reduction of the charges upon Irish railways, both for the transport of passengers and goods?—Yes, for passengers, and particular classes of goods, such as coals, cattle, &c. The main object appears to me to be, if possible, to improve in some way or other the management of railways in Ireland, so that the industry of that country might be stimulated by reduced charges; if that might be done without inflicting any pecuniary loss upon the present owners of the railways there, and also, if possible, without throwing any charge upon the imperial revenue. With that view, of course, I have considered that, in the acquisition of these railways, ample powers would be given for dealing with them as we do in this country as to the acquisition of land, (in this country or in other places,) for the formation of a railway in the first instance, when private rights have to give way for the public convenience. It is impossible in Ireland, or in any other country, to get the full benefit of railroads so long as they are cut up into a small number of divisions; you cannot have through rates, and you cannot have the power of adjusting the rates with that flexibility which my experience teaches me is necessary in order to give full convenience to the public, and to secure the largest revenue to the railway. What one ought to aim at in railways is very much the same as that which was done by the Post Office, that is, to have one rate, if possible, to all places. Of course that is practicable enough as to letters that pay a rate of 300*l.* a ton, a fixed charge, but the rate for carrying a ton of goods, even to the Land's End would be a very small per-centage upon that rate. Coal is an article which ought to be vended, in order to secure its extensive use, at a few shillings a ton; but that is a case that does not admit of that perfect equalization of rates which has been accomplished in the Post Office with regard to letters, and you can only approach it by consolidating the railway systems as much as possible. With that view it has occurred to me, looking at the Board of Trade returns, and the map of Ireland, and the extent of the railway traffic, that there is no practical difficulty, or no more, perhaps hardly so much, as in any other great system, in working all these railways under one management. There are some 1,100 or 1,200 miles of railway that the North Western company have under its present management. In the Great Eastern system we have about 700 miles. In Ireland, in 1863, there were 1,700 miles, probably there are now more; but the gross traffic in Ireland is only very nearly equivalent to that which we earn on the Great Eastern system, and running through a district which is an agricultural district merely. We have not more manufactures I think, upon the whole, than is comprised in the Irish system. There is Norwich and Ipswich, and then there are the fisheries at Yarmouth and Lowestoft. Then looking at the number of engines which I see are employed in Ireland, and also at the rolling stock, I am convinced that it is quite as easy to manage the whole of that system of railways under one system of management as it is to manage the North-western system, or the Great Northern system, or the Midland system. I assume that if you are to lower the rates in Ireland and to increase the accommodation, the basis of that is that the whole of the systems in Ireland should be consolidated, and worked under one management.

4218. Is it the result of your experience that the industry of a district cannot be much stimulated as long as the railways are in the hands of special companies?—It is so, and it is the fact that that disadvantage has been gradually met in this country by amalgamations. I am interested in a colliery in Staffordshire, in the North Staffordshire district, and their rate to us was a fair rate, that is, if I had been acting for the company I should certainly have charged that rate. We do not complain of it, nor do we complain of the rate charged by the North-western company; but having two rates combined, they almost prohibit us from establishing any coal trade in London.

4219. Have you considered any scheme by which an amalgamation could be effected of the Irish rail-

ways?—Yes, I have. In the first place I may mention an idea I have long entertained, and one that I believe to be applicable to this country; and that is, speaking from my own experience in the management of railways by boards of direction, I believe that they can be improved by being managed by individuals for their own interest, and in my opinion the most efficient management of the railways in Ireland would be obtained and carried out by what is called in these days a Limited Company, consisting of some 9 or 10 individuals. I mean that they should subscribe a capital of at least a million. That they should pay up one half, and one half of this to be invested to meet the security to be given to the Government. The other half would partly be required immediately for the purpose of increasing the rolling stock, and enlarging the stations, and for trade capital. Of course that company would have a contract let to them with all the conditions that might be imposed upon them, for affording every possible facility to the public, and subject to very low rates, certainly for coal, cattle, and passengers, and possibly for dairy produce, and to increase the traffic also in fish. That contract I should put out to tender, and I believe there would be no difficulty in obtaining tenders. Then you would have to guard against an obvious difficulty, by obtaining security that the rolling stock and permanent way should be adequately kept up, and that the covenants or conditions of the contract should be faithfully fulfilled; at the same time subject to this, that the fullest and freest action should be given to such a company. Now as regards the rolling stock, our experience at the present time is, I think, quite adequate to enable that to be fully secured, and also with regard to the permanent way. I let a contract, and I believe it was the only one that was worked out, for the rolling stock on the North Staffordshire railway when I was their engineer, and the precautions which I took there, and the additional experience which we have acquired since might be applied in this case, in order to fully secure to the Government that the estate they had leased should be fully and efficiently maintained; the plan that I adopted was that for every mile run by the trains, three halfpence was to be set aside out of the payment to the contractor and invested at interest, and out of that sum so invested he was allowed for any new engines that were bought and put upon the line for use; the effect of that was, that that three half-pence was rather in excess at that time of what was required for the renewals of engines, and it would be still more in excess with regard to modern engines; but it was to the contractor's interest, for rather than having that money lying comparatively idle, he could have new engines and have the use of them in working the railway. Now at the present time if a penny farthing is set aside per mile for the engine, and a similar amount is set aside for waggons and carriages, and that fund is kept solely applicable to provide new engines and carriages, and so on, you would, either in the shape of engines or carriages, or in the residue of that fund that might be left, have an estate, and part of that estate kept at its full value.

4220. You mean that a certain proportion should be set aside for every mile run by the trains?—Yes; so much for the engine and so much for the waggons, and so on.

4221. So much for every engine, every carriage, and every waggon?—Yes; or rather instead of complicating it with so much for every waggon and so much for every carriage, I should subdivide it into two sums per train mile, taking an average all round; so much for the engine, and so much for the rolling stock; and I would also adopt the same plan for permanent way. There are two elements in that, one of which is the sleepers, which decay, and which is irrespective of the wear and tear, or nearly so; then there is the rail, which decays according to the work done. That we find on the Great Eastern line comes to five-eighths of a penny, or a halfpenny and half a farthing per train mile. The sleepers must be made good as they decay, and with reference to that, I have been looking through the working expenses of the Irish railways for 1863, and the only part that will be subject to increase I think is the renewals of the sleepers, for the fund set aside for expenditure for permanent way will certainly be inadequate when that permanent way increases in its age and the sleepers decay. Subject to that I have no doubt that a large reduction could be made in the working expenses which, probably, would fully meet the increased expenditure that must become necessary for the purpose of replacing the sleepers.

4222. Would the leasing company be authorized from time to time out of the fund produced by this mileage rate to purchase new engines?—Yes.

4223. Do you mean that at the expiration of the term the whole of that fund should be handed over to the Government?—Yes; it must go to the Government, unless the lessees had absorbed it by engines. That fund would be a little in excess, and the interest of the lessees would be to absorb that fund in placing new stock upon the line.

4224. Every time a new engine was bought it would be paid for out of that fund?—Yes.

4225. And in a similar way with regard to additional waggons and carriages?—Yes, the same. Then there would be this to be met. The increase of receipts in Ireland was about 70,000*l.* in 1863, over 1862, and therefore there must be a provision made for an increase in the rolling stock, that would be necessary in order to meet the growth of the traffic. It would probably increase more rapidly than might be expected if worked in this way, and that would be easily enough provided for; because the advance made to the contractors for the rolling stock which they should be authorized to put on the line should be always represented by the gross increase of the annual revenue; that is to say, if it increased at the rate of 100,000*l.* a year, you would authorize the lessees to put 100,000*l.* worth of rolling stock upon the line. It is now I think pretty well admitted on all hands that the gross annual revenue under ordinary circumstances represents the working value of the rolling stock.

4226. Do you mean that every year there ought to be an additional amount of rolling stock equivalent to the increase of the previous year upon the different kinds of traffic?—Practically that takes place on all railways in England; certainly on the Great Eastern line; that is worked out with extreme accuracy and minuteness. I do not mean to say that that would apply to a railway like the Metropolitan line, which takes 30,000*l.* a mile per annum, nor to any small local line, that is taking from 400*l.* to 500*l.* a mile per annum; but taking any great system, that is quite sufficiently near to meet all general considerations.

4227. You have stated that this leasing company should have a considerable amount of freedom, but still that they should be restricted in certain respects as to the charges they were authorized to make?—Yes.

4228. Will you be kind enough to explain to the Commission in what respects you would leave them free to act, and in what respects you would limit their discretion?—As far as my view goes in regard to restriction, I should certainly restrict them generally to the present charges in all cases in Ireland. I should fix a maximum, and nothing should exceed the present existing charges. Then as to certain articles of large amount, take coal, cattle, or fish, or passengers. I would carry coal at 3/8ths of a penny per ton per mile. I would carry passengers by one train a day at a farthing a mile. I would have a train which might be used as a pick-up train, so that if there was not a large number of passengers to carry, it might bring up its earnings by carrying a certain quantity of goods, but that train should run so as to cover 12 miles an hour. With regard to cattle, at this moment I can hardly state what rate I should propose, because cattle from Ireland are cattle which

Mr. G. P. Bidder.

30th May 1865.

are brought over to England to be fattened. Pigs, of course, would be brought over already fattened, but probably, it would be something like one half of the rate charged in this country for similar traffic that I should limit the charge upon cattle to. With regard to the fish, I should get our fish rates from Lowestoft and Yarmouth, which pay us very well; probably they might be reduced one half with the view of stimulating that branch of industry.

4229. I do not quite understand whether you would compel the leasing company not to exceed those rates?—Yes, I would limit them to those rates.

4230. Then those would be their maximum rates?—Yes, they would be the maximum rates, but they might charge as much less as they liked. I have said that they should be limited to the present rates charged for all descriptions of traffic, and that they should be in future the maximum; but upon those great items of traffic which I think would stimulate the industry of Ireland, I should limit them still further, and make the rates I have mentioned the maximum.

4231. Would you include manure?—Certainly.

4232. Do you know enough of Ireland to be able to form a decided opinion that a reduction of the rates and charges to the amounts you have mentioned would operate as a great stimulus to the industry of the country?—I have not that local knowledge of Ireland to enable me to say that it would particularly apply there, but I believe that it would apply anywhere, and that the rates I have mentioned would stimulate the industry of any country.

4233. Do you think that, with a population so poor as that of the greater part of Ireland, there would ever be a large passenger traffic?—I think so, because this company would have all Ireland in its own hands; and at a farthing rate I believe you would have a large passenger traffic; in fact, the gentleman who has just been examined, Mr. Ennis, said that they had very large trains when they reduced the price per waggon, I think he said from Dublin to Galway; I have no doubt that you would have an enormous number at a farthing rate, and that you would make that the earning up to the amount which I consider to be the normal earning of all railway trains, viz., 5*s.* a mile.

4234. Are you aware that Mr. Ennis stated it was only during harvest time that the low fares were charged?—No doubt; but I think that one of the objects which the Commission has in view as to Ireland is, that this rate should be applied continuously, and it will only be by applying it continuously, that you will really know the extent of the traffic that it excites.

4235. From your experience of the Eastern Counties railway, do you think that a large amount of traffic can be carried in a purely agricultural district?—We have a very large traffic there. We have carried this year, omitting coals, about 1,800,000 tons. Coal we are seeking very much to increase, but this is merely agricultural produce and fish.

4236. Do you look upon coal as one of the main articles of produce in the Irish traffic?—I think there is no doubt that there would be an increase if you charged at the rate that we are bringing coals into London now for; we had a contest last year as to bringing them in at a farthing a ton per mile, and then it was urged by nearly all the railway managers that it was absurd, but I believe they all now agree that it was not absurd, and in the cases of those who were the most opposed to us, they are prepared to quote the same rate with us. We are now bringing coals from Peterborough to London, a distance of 100 miles, for 124 farthings.

4237. Are you aware that a large proportion of the Irish population live in cottages in which there are no means of using coal?—Yes; but coal is such a blessing that if they could get it at a cheap rate I think they would consume it. Coal is incomparably better than any peat or wood, and even in Norway, where they can get wood for next to nothing, I know families who, whenever they can get coal, use it.

4238. Do you look forward to a consumption of coal chiefly for household purposes, or that, if it were carried cheaply, manufactures would gradually be established in the country?—No doubt it would assist in the establishment of manufactures.

4239. Do you look to a large increase in the consumption of coal for household purposes?—Yes; one of the main objects of the railways ought to be the diffusion of coal.

4240. Can you state at what price you think it would be practicable for coal to be delivered at the stations in the central parts of Ireland?—Three-eighths of a penny a ton per mile. You must charge three-eighths of a penny and allow 5*d.* for terminals. You could not carry it for three-eighths of a penny for nine or 10 miles; you could not handle it for that, and therefore 5*d.* for terminals is what is allowed everywhere now.

4241. Take a distance of 100 miles from Dublin, what would the cost be at three-eighths of a penny a ton per mile?—It would be 3*s.* 1½*d.*; then, if you add to that 5*d.* for terminals, it would be 3*s.* 6½*d.*

4242. What is the price of coals delivered on the quays in Dublin?—I do not know, but I assume that it would not be above 8*s.* or 9*s.* a ton; I only judge from knowing where they come from, and what the freight ought to be.

4243. If, in Dublin, the price of coals is 15*s.* or 16*s.* a ton, and you must add 3*s.* 6½*d.* to that, that appears to be a very large amount?—I suppose that that is the price when delivered.

4244. I think it was stated that deducting 1*s.* 6*d.* for cartage, the price at the quay was 14*s.* 6*d.*?—If so, it is as dear as it is delivered in the Thames, so much farther from Newcastle.

4245. Unless the price of coal was reduced considerably below 20*s.* a ton, do you believe that any great consumption of it could take place in Ireland?—Not among the poorer population perhaps, but still one hardly knows. Referring to the agricultural population in Norfolk, where they burned wood before we went there, and where the population are very poor, 800,000 tons of coal a year have been imported there, and then we also carry coals to Lynn, Wisbeach, Yarmouth, Lowestoft, and Harwich. A ton of coal is equal to about seven or eight tons of wood, with regard to the heat that it gives out.

4246. The first step you would take, I suppose, would be to obtain an Act of Parliament authorizing the Government to take possession of all the Irish railways?—Yes.

4247. What sort of provisions would you have inserted in that Act?—In the first place you would have to deal with three descriptions of stock; you would have the debenture stock, the preference shares, and then the ordinary stock. Of course you would impress upon this stock the Government guarantee, and dealing first with the debentures, they might be converted into terminable annuities at 3½ per cent. interest, that is rather more than the funds now yield, but you must make them an advantage in respect of interest to get people to take them; or if you compel them to take them, at all events the scale must turn in their favour. If you added 1 per cent. to that, those annuities would all expire in 43 years, that is to say, 4½ per cent. all round, and then the present charge upon the railways from this item would terminate in 43 years. Then as to the preference stocks, they do not carry so many years' purchase as the debentures; probably some of them are not well secured, or not marketable, as we know in this country, and probably they will not range at more than 5 per cent.; 100*l.* of that stock would represent 5*l.* of current interest; then I should calculate that 100*l.*, taking the value, and not the interest, also at 4½ per cent., and make it a terminable annuity.

4248. Would it, in your opinion, be just to deal with the holders of preference shares in that way,

supposing them to be irredeemable?—Quite just, if I give them in exchange for their preference shares a security which bears a higher market value; it would be quite as just as taking possession of a house in the City of London. If you take a house, or you give a railway company authority to take it for the purpose of making a railway, you take care that the compensation to the owner shall be adequate, and if you take possession of these railways in Ireland for the sake of improving the condition of the country, you must do there the same thing as you do when you take possession of a banking house in the City, to make room for a railway. Then as to the holders of ordinary shares, I do not know the process in Irish railways, but you must take some period before the Act, whether you take one year or two years; but you will find that the rule holds there as it does in England, that they bear about 20 years' purchase; but there is also some little speculation in that, as the increase of receipts will increase, the current dividends and the price of the shares; but they would represent about 20 years' purchase. I find, by the Board of Trade returns, that the capital embarked in Irish railways may be taken to be, in round numbers, 24,000,000*l*; that is, at the end of 1863. 12,000,000*l*. I should say in debenture and preference shares, and 12,000,000*l*. in ordinary shares. Then the revenue is 1,578,000*l*., leaving about 768,000*l*. net. Then, assuming that the 12,000,000*l*. of debentures and preference shares rule at 5 per cent., there will be 600,000*l*. absorbed out of the 768,000*l*. in preference charges, which leaves only 168,000*l*. for the dividends on the ordinary shares, and that would hardly leave more than 1½ per cent. If you took 1½ per cent. and gave them that at once, that would be worth 30*l*. market value. If you gave to it the Government guarantee you would make it, at 1½ per cent. worth from 42*l*. to 43*l*. If you so dealt with it (and that is one way of doing it) you would give them the advantage of 30 or 40 per cent. upon the value of the stock. But there is another way of dealing with it, and that is, to confirm them in the existing dividends, or convert the stock into capital, giving the holders certain contingent advantages to be derived from the future working of the railways, and the expansion of the traffic. The public do, somehow or other, always incline to put a liberal value upon anything that is a little speculative. These are two modes in which you might deal with that stock, and still give a decided advantage, in the present value of the stock, to the present owners of it.

4249. Upon a large number of ordinary shares in Irish railways, no dividend whatever is paid?—That is so.

4250. Would you compel the holders of them to make a present of them to the Government?—No; you must take the market value of them, and deal with them.

4251. Are there not some shares that are perfectly unsaleable, and that have no value in the market at present, but which, nevertheless, the shareholders would be unwilling to throw away?—I should think it would be found that they would exchange hands if you impressed a value upon them, but still you could deal with them; there is quite margin enough, I am convinced, even to give them a value, to make it worth while to exchange them.

4252. When the Government had dealt thus with the holders of the debentures and shares, you would then proceed to offer a lease of the railways to a company?—Yes.

4253. If no company was found willing to offer such terms as would enable the Government to meet their engagements, how should the deficiency be made up?—I assume the question to mean that an offer would not be made.

4254. That the Government would not obtain an offer upon terms that would enable them to meet their engagements?—I can hardly suppose that; I believe they would. But this must be borne in mind, that the terminable annuities, which would amount to 540,000*l*. a year, supposing that the working of the railways went on for 43 years, would, at the expiration of that time, all fall in, and the whole would become the property of the State; and as they had been paid off by the revenue received in Ireland, I take it that then, to the extent of the annuities which would fall in, you would make further abatements in the charges made upon the railways. And if, in the meantime, there was any deficiency, you would carry that on after the charge against the railways had been satisfied, after the expiration of 43 years, and you would then have 120,000*l*. a year to meet any deficiencies arising out of the terms of the lease.

4255. Do you entertain a confident opinion that offers would be made to the Government by such a company as you have supposed?—Yes; and if I was a younger man I should be very glad to form one of the party, for I should feel certain that it would be a very profitable undertaking. But there is another question as to that that ought to be considered, whether there would not be some objection to any individuals taking a lease being bound for so long a period as 43 years. People do not like that generally, and therefore I would suggest that the terms of the lease should be re-considered in not less than every 10 years, and probably not more than 14 years; and so have the terms of the lease re-adjusted upon the net revenue of the railway at that period. Then of course there is this obvious objection, that it would not be for the interests of the lessees to stimulate traffic beyond a certain point; or if they did, the effect would be to raise the terms which they would have to pay after that period had elapsed; and I would propose to meet that in this way, so as to make their interests and those of the state identical. Suppose, for example, that they had an increase of traffic to the extent of £100,000 a year gross, of which one half, £50,000, would be net. I would then assign to them one fourth of that, either in the shape of interest, or in capital, as a bonus for the traffic of the previous ten years, and that would be a very large element of profit. Then you would go on either by reducing the rates charged upon the railways to the extent of the increase of traffic, or you would get large means to enable you to liquidate the debt that might have accrued upon the railways. In the natural course of things the traffic must increase, and if all the rates were in one hand, so that they could put an end to equal mileage rates, which are quite subversive of all railway traffic (and which is one of the first things that a limited company would do), they would establish through rates, so as to get any trade that could be got and leave a profit. Take the trade between Belfast and Galway, which now has to pass over the Westport line, and over three or four other railways, it is not worth while to cut up the whole of the profit upon three or four railways, but it would be worth while to carry the whole of the goods at any rate that would leave a profit.

4256. You have not stated how you would deal with any extensions of railways in Ireland?—There are two ways of dealing with them. In the first place, if the extensions were not projected by the limited company, or by the State, but by other parties, I would bind them to work them at 50 per cent. under covenants that they should work the traffic fairly. If, on the other hand, the limited company projected them, then they should be liable for the full interest, which they would have to pay in respect of the cost of any such extensions.

4257. You would put all future extensions of railways and the traffic upon them into the hands of this company?—Yes, they must be in their hands.

4258. There may be fresh Acts of Parliament obtained this session; what would you do with the railways authorized by those Acts?—I can hardly give a satisfactory answer to that. I should like to see those Acts first, and consider the circumstances connected with them; but I think you might provide for them by leaving an option to parties to make a

Mr. G. P. Bidder.

30th May 1865.

line, compelling the new company to work it at 50 per cent.; they could not work it for less. There might be this difficulty to deal with, supposing it was a large company, they might abstract traffic unfairly from them, and carry it on their own line, and carry it round about, or divert it; and to meet that, I would suggest that wherever the new line formed the shortest route, it should be credited with the traffic, whether it went over that line or not.

4259. (*Lord Stanley.*) With regard to the purchase of lines of railways, in the first instance, by the Government, I suppose, as to the debentures, there would be no difficulty; they have a recognized market value, and you would have to purchase them at their value?—Yes.

4260. It would be merely the purchase of a debt having a limited term to run?—Yes.

4261. I do not understand the object of turning the debentures into terminable annuities; why not take them over as they stand, and raise money on lower terms, as the Government are able to do, for the purpose of paying off the debts so incurred?—I think the advantage of the plan would be this, that it would be a great thing to get rid of them in the space of 43 years, then they would merge and become the property of the State to deal with as they pleased. Whether you should issue them at $3\frac{1}{2}$ per cent. with the security of the State, or at $4\frac{1}{2}$ per cent. to terminate at the end of 43 years, is a matter of opinion. I should make them terminable annuities.

4262. You would prefer to turn them into terminable annuities as merely another form of providing a sinking fund for the extinction of the debt to be contracted?—Yes.

4263. Do you propose that the persons actually holding the debentures should be compelled to take these terminable annuities, whether they were a form of security as convenient for them to hold or not?—It would not be necessary as to the debentures, because they would expire in a certain time. You would have, perhaps, a little more interest to pay upon them; you would only take them, and re-issue the Government paper, and therefore there need be no extraordinary powers taken as to them, because a few years must put an end to them.

4264. Putting aside for a moment the question of creating a sinking fund, all you have to do as to the debentures is simply to take them over?—Yes.

4265. With regard to the preference shares and the ordinary shares, do you think it would be just to the holders of those shares to take them at their market value?—Yes. I should take them at their market value. Suppose you had 5 per cent. preference stock, and that is worth 100*l.*, perhaps a fair rate; you would give in lieu of that a terminable annuity of 4*l.* 10*s.*, and at the present price of the funds, that 100*l.* would be worth about 105*l.* Then you would inflict no hardship upon the holder, because he could purchase plenty of preference stock to give him 5 per cent., and he would get 4*s.* or 5*s.* per cent. more interest for his money.

4266. Take this case, which would apply equally to preference shares: supposing I purchase a certain quantity of stock in a railway, paying next to no dividend, and suppose that I then submit to receive only 1 or $1\frac{1}{2}$ per cent. for a certain number of years, in the confident expectation that the line will improve, and that the capital I have embarked will double itself in value; do you think it would be fair for the Government, or any one, to come and purchase compulsorily that which I have so invested, on a calculation of the actual return it has brought me, and not what I expect it will bring?—If it is regarded as preference stock, and the railway has not been paying its charges, but there is an expectation that it will, that preference stock must be represented by the market value. I cannot provide for a fancy value. With regard to ordinary stock we have had a very strong case in the Caledonian railway, where the stock once was at 15*l.* or 16*l.* to the 100*l.* I really do not know what premium it is at now, but it is at a considerable premium, and that company was allowed by an Act of Parliament to cut down all their preference charges, so that you can hardly deal with the market value; you might, in this case, if you adopt my suggestion, of giving terminable annuities, assuming that the railway does meet its charges, including those terminable annuities, have an accumulating fund, out of which you could give contingent advantages to the ordinary stockholders, which would be more than equivalent for any hardship you put upon them.

4267. I am looking to the interest and to the just claims of a person upon whom you propose to call to sell his property; do you think it would be just to call upon a man to sell stock of comparatively small value at the present time, and which he is unwilling to sell, because he has a reasonable expectation that its value will become double in a few years?—If there is a reasonable expectation of that sort it must be based on the usual data, and they are as accessible to others as to himself, and will be represented by the market value.

4268. Do you think that the actual market value is the only thing that should guide you?—Yes; if there be cases where there is no market value, probably some mode of arbitration might be established to give a fair value to the stock.

4269. You have probably had a good deal of experience as to compulsory purchases and sales?—Yes.

4270. Did you ever know a case in which a railway company, purchasing land compulsorily, did not pay for what it bought more than the market value?—I cannot say that I have; they generally pay a great deal more.

4271. Then I may suppose that if the State bought up all the railway property in Ireland, it must give, not merely the market value, but something over and above it?—Yes.

4272. It would not be able to make a favourable bargain?—I think the result would be favourable to them; I think the charges, with the Government guarantee, would be so reduced that the result would be favourable to them. But if you mean that the Government would not acquire the stock at its fair value, I may say that I do not believe they would, and I think that you ought to give the turn of the scale to the other parties.

4273. Whatever might be the ultimate result, you must start with a bad bargain?—You must pay more for the railways than they are absolutely worth.

4274. Your proposal is to lease out the Irish railways to one large company for a short period?—I should lease them out for the whole period; but, as I have before stated, I think that the terms of the lease should be re-adjusted after every 10, and not more than 14 years.

4275. The very essence of your system is, as I understand it, that you would incur considerable temporary loss by a large reduction of the fares and charges?—I do not think there would be; I doubt it very much. I believe this, that the economy which would be introduced by sweeping away many boards of directors, the greater economy that would take place in the working from being in one set of hands, the greater use that would be made of the rolling stock, and the stimulus that would be given to traffic by a lowering of the rates, would be attended with great advantages. I believe that a company taking the Irish railways in hand upon the terms I have suggested, and beginning at once upon those terms would relieve the State from any possible loss. If my views are correct, and if their operations were carried on for 10 or 14 years, there would be no loss; there might be a loss in the first year or two; but I believe they would recover from that afterwards.

4276. They would make a bargain by which they would expect to sustain a loss for the first few years, but with the hope of recouping themselves by a gain towards the end of the period you have mentioned?—Yes; in the hope of relieving themselves from any

loss, they would look forward to being able to increase the traffic to such an extent that at the end of 10 or 14 years they would have a large bonus in respect to it.

4277. You would not tie their hands very tightly as to the amount of reductions they should make?—No; I would leave them to deal with the traffic as they thought fit, so that they might establish the greatest equality of rates as to mileage rates, and as to the actual charges.

4278. You feel confident that you could get, in the first instance, such terms offered to the State as would cover the interest of the debt that the state would incur in purchasing the railway property in Ireland?—I have no doubt of it; and if I were a younger man I should like to be one of the party.

4279. In the event of there being a loss, I presume it would fall upon the State?—There must be a loss of 120,000*l.* a year, or there will be no loss to the State.

4280. The sum which the Government would have to pay would be about 24,000,000*l.*, would it not?—No. If you take the debentures and preference stock as one item upon 12,000,000*l.*, it would be, at 4½ per cent., 540,000*l.* a year. But unless I had all the half-yearly accounts I could not give you the exact figures. Then there would be 12,000,000*l.* of ordinary stock, which would certainly not have more than 170,000*l.* a year to divide amongst it. If you increase that at once to 200,000*l.* a year, then you have only 740,000*l.*, as against 770,000*l.* the existing net revenue. You have 540,000*l.* every year to pay, and there is an accumulated value to the State of 120,000*l.* out of that.

4281. You propose, with regard to the creation of any new lines of railway to be added to the proposed system, that they should be laid out upon the same plan as at present?—Yes; upon the same plan, and that the company should be compelled to work them at 50 per cent., and that those lines should have the traffic secured to them for which they were fairly designed; if they abstracted or diverted that traffic, they should account for it all the same.

4282. If you suppose from the first that the rent received from the company to which these lines of railway would be let, would cover the expense incurred by the State, I do not see the advantage of your plan of terminable annuities?—It is this, that at the end of 43 years, I suppose that all the charges will have been met, and the terminable annuities will be at an end, and gone. Then you will have an opportunity of applying that saving of 540,000*l.* either in renewing the lease to the other parties with so much less charges, and therefore so much less rates; or on the other hand, if there is a deficiency, you will have the 540,000*l.* a year to meet that, and I think that you would be more relieved from clamour by having the charge in that way.

4283. What is there in this plan that would not be equally well accomplished by these two methods: In the first place, allowing the existing companies to borrow money to pay off their debentures, borrowing upon the security of the State at a reduced rate of interest; and next, if Parliament thought it desirable, to have compulsory amalgamation between the leading railway companies?—I think it should extend over the whole system. I hold that you will not secure the full advantages in Ireland which I am contemplating unless all the railways are in one set of hands. If you divide them into two systems, you must have the rights of two parties to deal with, and what would satisfy one would not satisfy two, and there would always be disputes to settle, and jealousies between them, which there always are between adjoining railway companies. The scheme is very manageable as to capital, and as to working, and why should you give up the full advantages of it by complicating the matter and cutting up the railways into two or three systems. I think it would be more difficult to carry out.

4284. Do you think there would be any material loss sustained if, instead of a complete amalgamation of all the companies, they were divided into two systems, taking a line drawn from Dublin westward; and giving the railways to the north of that line to one set of managers, and those to the south to another?—I do not think that would be so good a plan; no doubt it would be a great improvement upon the present system; but it would not be equivalent to converting them all into one system. There is no doubt great traffic arising from Belfast, and if it was properly cultivated, I believe that traffic would spring up that nobody knows anything about. When a company can quote a rate, without having to go to another party, it excites traffic which nobody has any notion of at all until the facilities are given.

4285. Can you explain to the Commission what there is peculiar in the state of Ireland which requires that the State should take upon itself a duty and a responsibility which it has never incurred before in this country?—That is not my affair.

4286. You would decline to discuss the general policy of such a step on the part of the State?—Certainly. If you can confer a great benefit upon Ireland, the same as you might confer upon any county in England, without laying any charge upon the State, I cannot help feeling that it is very desirable to do so. I should object to it if it were to be done by laying any charge upon the State.

4287. The State has at all times the command of capital at a lower rate of interest than individuals have?—Yes.

4288. And the State by borrowing at its own low rate of interest and accommodating companies with capital so obtained, can confer upon them a great benefit?—Yes, and it is a great benefit, and we see now what an opportunity the State had before if they had adopted my plan; if the State had supplied railway debentures at 4½ per cent., in a few years a large amount of debentures would have become the property of the State, with positive advantage to the railways.

4289. That is quite a different proposal. You say that the Government might have lent to the existing companies at 4½ per cent., and that they might have raised their money at 3½ per cent., employing the other 1 per cent. as a sinking fund?—Yes.

4290. And that they might thereby have made, both for themselves and the public, a very considerable profit?—Certainly, and they might do that now.

4291. But that is an entirely different proposition from that of leasing all the railways in Ireland to a new company?—It is entirely a different one, and is much more comprehensive; but it is part of the general proposition, when it is said that railways are so unmanageable now in the United Kingdom.

4292. You say that you do not wish to discuss the general policy of your plan, and therefore I, perhaps, may not ask you whether you think that there would not be a perpetual pressure upon the Government to get this new company worked on such terms as should be hardly remunerative?—The answer to that is, that you would have made your contract with the company, and that would be an answer to all clamour, and the contract would last for 43 years.

4293. I think you spoke of the probability of Irish railways being ultimately considered a permanent source of profit to the public exchequer?—I did not say that exactly; but if the Irish railways, at the end of 43 years, shall have paid off all their charges, and shall have paid off these terminable annuities, I think that that capital in the terminable annuities would belong to Ireland and should be given to it, and if there should be any charge that was not met, that that should be carried on for the future. You might deal with that property, either by keeping the interest for State purposes, or you might renew the lease at still lower charges, calculated upon the reduction in the annual interest.

4294. Upon what do you found your calculation as to a company being found willing to take over the

Mr. G. P. Bidder.

30th May 1865.

railways at such a rate as would not cause loss to the State; have you gone into that question in detail?—I can see that in Ireland there are very much the same elements to be worked out in figures as there are in this country; the earnings per mile are the same; the expenses are the same; but the railways are worked now by a number of small companies, with a great many establishments, and you see the miscellaneous charges put down at something like 80,000*l.* a year. A large proportion of that amount would be saved; and then the rolling stock, the maintenance of it, and the use of it, would be made much more efficient, that is to say, the new company would then work but for one object, and they would make two waggons do the work of three. If they were worked by individuals working for their own benefit, it is well known in this country that they will be worked much more advantageously than when railways are worked by boards of directors.

4295. I do not question the advantage of having a few large companies instead of many small ones, but is it not your experience in this country that there is a tendency in small companies to consolidate themselves into a great system?—Yes; they are doing that now rapidly in this country.

4296. The Great Western company have done it, and the North-western too?—Yes; all the large companies have done it.

4297. And that has been done without State interference of any kind?—Yes.

4298. Simply by men of business and men of commercial experience seeing that is was profitable to do so?—Yes.

4299. Why should not that same rule be acted upon in Ireland?—I have no doubt that it would go on in Ireland, and that it would work in time; but many years, I think, must elapse before it would work. I think that this is really a case in which the State might step in and hasten all these operations, and by one piece of legislation secure very great advantages to the public in Ireland without throwing any charge upon the State. I feel assured that it can be done, and with regard to the capital it is on so moderate a scale that as a mere experiment only I really think it is worth trying. I am sure that the advantages I have pointed out will result from it.

4300. I suppose the advantage of concentrating all the railway companies into one would be felt in England as well as in Ireland?—Yes; we know that in England great advantage has resulted from consolidating many small companies into large ones; but if they are too large I do not think that much more advantage can be got.

4301. You think that some of the great English companies have reached the limit of size for convenience in working?—No, I do not think that amalgamation in England is complete yet. The Great Western company is one large company, and at the present time there are four companies that ought to be one, and will be one from John o'Groat's house to the Land's End. The North-western company I dare say will be some day one company to Aberdeen, I know that they are always trying for it. We, the Great Eastern company, want to go to Edinburgh, and to be one company all the way.

4302. Do you not think that everything you have said as to the Irish railways is equally applicable to the English railways?—Not equally applicable, but in some respects it is. I think that there is a great opening for the State to step in in the case of the English railways and take the debentures; I know that it would be felt as a great convenience to several railway companies. The State would have them to deal with as they came falling in as valuable property.

4303. Should you be prepared to see the State take over all the English railways?—No, not to take over all the railways at all.

4304. Do you look upon the scheme with regard to Ireland, as an experiment intended to test the possibility of doing the same thing in England, or as an exceptional case?—I look upon it as an exceptional case; I doubt that in England you can go beyond dealing with the preference capital; you cannot interfere with the management.

4305. If Ireland is an exceptional case, will you be good enough to state the circumstances that make it exceptional?—First, of all you have got a system of railways in that country of a manageable extent and with a manageable capital, but from which the greatest possible inconveniences arise to the public from their being cut up into a number of small companies, but being so cut up, an opportunity does arise, and a case occurs in which the State can step in and deal with it, without incurring any liability; but at the same time conferring, without doubt great benefits upon the country.

4306. The Irish railways, according to your statement, are very much in the condition in which the English railways were, when the Manchester and Liverpool railway was a separate line, and the London and Birmingham also was a separate line?—Yes.

4307. In course of time, they have worked out of that state of things without any State assistance?—Yes.

4308. (*Mr. Gower.*) Do you consider that the market value of railway shares would be likely to be considerably raised, if there was any expectation of your scheme being adopted?—I think it is very likely.

4309. Would not that be an artificial value in view of its adoption?—No, you must take the value, but you most antedate the period at which you take the value.

4310. You would take the value at a certain period before?—Yes, I would take it at the announcement of the scheme.

4311. Supposing the traffic on the railways was to increase between the first proposal of the scheme and its adoption, would not great dissatisfaction be felt if the value of the shares at the time of the first proposal was adopted?—I have no doubt that if this were carried out there would be some dissatisfaction amongst the ordinary shareholders, but still I contemplate that any terms you might make must be in advance of the present value.

4312. Is it your proposal that the lease of the Irish railways should be offered to be competed for by any number of companies?—Yes; to those that were prepared with the requisite capital and security.

4313. Would you make it an absolute rule that whichever company offered the best terms should have it?—Yes, the best terms, taking all the circumstances into account; because there might be circumstances connected with one offer which, although of a less pecuniary amount, would make it the most eligible.

4314. Who should decide upon that qnestion as to which company offered the best terms?—I suppose that you would put it in the hands of parties who were competent to deal with the matter. I think there ought to be a commission of some sort to receive and judge of the tenders.

4315. You would propose that there should be some commission or board appointed to judge of the tenders with a view to carrying out your scheme?—You must have somebody appointed to determine the conditions upon which the railways are to be let, and to report upon the tenders that may be offered; and that probably would be one of the greatest difficulties in the way of it, for it is very difficult to find in the State those who have had experience in dealing with these matters.

4316. Do you think that it ought to be an Irish board?—No, I think not.

4317. Should you approve of Irishmen being members of the board?—Certainly.

4318. We have been informed that one of the reasons why railways in Ireland are not amalgamated is, because local jealousies exist there more than in England; do you not think that the existence of those local jealousies would cause great dissatisfaction to be felt with any scheme of this sort?—I dare say

there would be many persons who would, by the carrying out of this scheme, be dispossessed of their influence, and they perhaps would feel very much dissatisfied; but when once the whole management was placed in the hands of a company of individuals, they would not pay much attention to local dissatisfaction.

4319. With regard to the extension of railways, I did not quite understand from you, who was to decide as to what extensions should be carried out?—There are two parties; first of all there is this limited company, and suppose the lessees desired to make an extension, it would go through the ordinary ordeal; they would go for their Act, and if they carried it out, they would have to pay all the charges upon it, and that would be a security to the State. If the State, or persons in a locality, thought fit to have a railway, they would have to find the money, and those parties would be compelled to work it on proper terms; or the parties might work it themselves, although they never could work it so well.

4320. Do you think that localities which are not now served by railways could obtain power to make them with much facility if they were opposed by so powerful a company as you propose to have in this case?—I do not think it would be very powerful as to influence. They would not have a large parliamentary influence, unless they consisted of Members of Parliament, which of course is not likely. The Great Eastern company are a large company, but they do not possess any influence in that way.

4321. Would you permit your proposed company to appear in opposition to any application that might be made by other parties?—The referees must of course judge of their *locus standi*. You could not oppose them if they had a legitimate *locus standi*.

4322. (*Mr. Ayrton.*) I presume that the purchase of any railways that yielded more than 4 per cent. would, according to the Act of Parliament, be at the rate of 100*l.* for every 4 per cent. of income?—Yes.

4323. Therefore all railways yielding as far as they did yield more than 4 per cent. must be purchased at that rate?—Yes, if purchased by the State.

4324. That would apply to all preference capital, would it not, whether the railway yielded 4 per cent. or not?—I suppose it would.

4325. You would proceed upon that basis?—No.

4326. How would you get rid of that basis as to Ireland unless you proposed to abandon it as to England?—I suppose that nobody in their senses would apply it to buying up railways at 25 years' purchase. I do not suppose that that was ever intended to be acted upon in that way.

4327. Will you explain what would be the difference in favour of a purchase, supposing a lease could only be made according to the present returns?—You see that you have this advantage upon the present returns, that all the charges and the preference charges will fall in within a limited period of years.

4328. I mean, what would represent the interest of the sum of money the Government would have to pay compared with the 768,000*l.*, or have you calculated what would be the charge for the interest upon the money the Government would pay for the railways as compared with what they would receive?—There would be 540,000*l.* a year on the preference stock, and that would leave 230,000*l.* a year to be appropriated to the ordinary shares, without any liability attaching to the State.

4329. What would be the interest upon the sum the Government must pay to purchase up the ordinary shares?—I do not know that; I do not know the present market value.

4330. Have you made any investigation as to the particular sources of increase of revenue that would result from a differential charge?—No, and I do not think that anyone can do so at present; but one thing is quite clear, you find that all the mineral traffic in Ireland is represented by 234,000 tons. I look upon that as a perfectly ridiculous amount, and I think that it ought to be quadrupled at least. We find that whenever we establish low rates, and we give railway companies the means of quoting rates between certain places for certain traffic, a traffic arises which nobody knows anything about.

4331. What would be the increase of traffic that would be required to make the income equivalent to a corresponding decrease in the rates?—Seeing that the whole amount of the mineral traffic in Ireland is only 234,000 tons, the proceeds from that must be very small, and if you were to reduce the rate charged to one-half, I think you must double the quantity carried; but in what time it would recoup itself, no one, I think, can say. It is plain, however, that by putting the whole of the systems of railways in Ireland under one management, it would be the interest of the parties entrusted with that management to cultivate the traffic, and I believe that there would be traffic that nobody knows of.

4332. Would you not do something more than merely double the quantity of minerals carried, if you reduced the rate by one-half?—Yes, you would have more traffic to work.

4333. Have you considered the ratio of increase that would be necessary upon the working expenses?—That does not come out, but the fact is this; we find as a rule, that whatever the traffic is, whether at low or at high rates, it is made up by quantity, and it in fact comes to this, that the normal earnings of a railway are 5*s.* a train mile, and the normal expenses are 2*s.* 6*d.* a train mile. If you take the earnings in England, and the earnings in Ireland, upon any of the great systems, that is what they are; they all tend to that.

4334. What increase of traffic do you think would be required, speaking generally, would it be three times the amount of the existing traffic?—No. If you take coal which is now carried at three farthings a mile, and you carry it for three-eighths of a penny a mile, you must probably take three tons for one to get the same profit; but you get it back in this way, if you have small rates, you will get large train loads, which they do not get now. I suppose that at the present time there is not a single goods train loaded up to one-fourth of its capacity.

4335. Is not the increase on English railways, and also upon continental lines, mainly due to the fact that they have long leads?—Yes, a great deal of it is.

4336. Do you not think that, as a general rule, that would be much modified in a country where the heart of it, could only give you a lead of 60 miles?—Yes; but that would be met in this way; there would be a terminal charge which would be made, whether the articles were carried 50 miles or 60. On coals that terminal charge would be 5*d.* and then the three-eighths of a penny would attach also; but there is no doubt that the longer the lead the better.

4337. What do you consider to be the demurrage upon a waggon per day?—I have known it to be charged as high as 2*s.* 6*d.*, but that is intended to compel people not to keep them under demurrage; the real cost of demurrage is regulated by what you can haul a waggon per annum for, and you divide that by the number of days; you can haul a large 10-ton waggon for about 10*l.* a year, and if you divide that by 312 that gives you probably a shilling or more a day.

4338. But that becomes a very serious question, does it not, in loading and unloading, and keeping waggons for longer and shorter distances?—No; we do not get the mileage out of the waggons at very much less than you would imagine it is to be got out of them at; and that is one of the advantages which you derive when you consolidate systems, for you get rid of those demurrages.

4339. How shall you be able to give long through rates in a country which is so narrow between any two points of it?—You cannot have so long a through rate as you can where a country is extensive, but still

Mr. G. P. Bidder.

30th May 1865.

pro tanto it would be an advantage to consolidate railways and to get as long a lead as you can.

4340. Where the lead is so short, does not a reduction of rates produce a very small total reduction in the charge for conveyance, say, from the interior to any port?—That depends upon the amount. If the distance were 50 miles, and upon coal you charged a penny a ton per mile, and you reduced the rate to five-eighths of a penny, you would effect a reduction of 2*s.* 6*d.* a ton.

4341. Do you believe that a reduction of 2*s.* 6*d.* a ton would stimulate the consumption of coal to the extent of three times the present quantity?—I have not information before me to enable me to answer that question.

4342. You propose, by your scheme, to reduce the charge upon passengers to a farthing a mile?—Yes; and to run one train a day.

4343. If you reduced the charge to a farthing per mile what would be the requisite increase in the number of the passengers to make up the net receipt?—It would be obtained upon the traffic altogether. At that farthing per mile people would travel who do not now travel at all. Of course it would require 240 passengers to earn 5*s.* a mile. I propose that the train should travel at the rate of 12 miles an hour, and should make up its earnings by taking goods from station to station on its way.

4344. Having regard to a comparison between the Great Eastern system and the Irish systems, do you think, considering that the length of the Great Eastern is 673 miles and that the Irish system is 1598 miles, and the income of the Great Eastern company is 1,497,000*l.*, and that of the Irish systems 1,518,000*l.*, that the working expenses of the Irish systems, which are 750,000*l.*, compare unfavourably with those of the Great Eastern company, which are 770,000*l.*?—I think I have already alluded to that; and I said that the existing earnings of the Great Eastern company are about 1,700,000*l.*, and that the working expenses are very nearly 50 per cent.; but with regard to the Irish railways there is one thing to be taken into account, which is, that the charge for the permanent way is not made up to its average amount, the sleepers have not yet begun to decay in such quantities as would give the fair average cost; excepting that, and assuming that the accounts have been honestly rendered, they speak for themselves, subject to what I have said as to the sleepers. They certainly get some advantage in their wages, but with that exception the working expenses appear to be very nearly the same per-centage.

4345. The chief difference would seem to be in the miscellaneous charges; those of the Great Eastern being 34,000*l.*, and in the Irish system 82,000*l.*?—Yes, and those charges on the Great Eastern would be much reduced if the system was worked by individuals.

4346. Do you see any objection to the amalgamation in Ireland being carried out upon the basis of the Great Western amalgamation?—I do not know what their basis is, but there is no doubt that you can establish a satisfactory basis for amalgamation.

4347. That has been arrived at after a conflict between a great variety of very hostile interests?—No doubt it has.

4348. Previously to that amalgamation was there not, especially in Wales, as great a division of railway interests as even in Ireland?—Yes, and so there is now.

4349. Those Welsh railways are being rapidly absorbed, are they not?—Yes; that is going on very well.

4350. The division of capital and the smallness of the lines in South Wales was as great as it is in Ireland?—Yes.

4351. They are all being combined upon a basis which is agreed upon?—A great many of them are.

4352. Is that basis this, taking the existing earnings as a certain proportion of 100*l.*, and dividing the future gains in that ratio?—It is often this (although every one stands on its own basis) that if there are three railways, and one is paying 4 per cent., another 3 per cent., and another 2 per cent., they sometimes combine, so that in future their relative dividends should also be in the same ratio.

4353. Why should not the amalgamation be made upon the bases that have been arrived at by conflicting interests in England?—I think you would find that a much more difficult problem to deal with, especially taking into account those railways that pay no dividends; it would be more difficult to get them to amalgamate among themselves than to deal with them as a whole. I think you would find greater difficulty in dealing with local jealousies than in dealing with the whole question as one proposition.

4354. Have you considered the income of the different Irish railways in reference to the whole amount of revenue as compared with the value of the district which the Great Eastern system serves?—No.

4355. (*Capt. Galton.*) In England the principal railway companies are amalgamated together, but there has been no wholesale reduction of the fares, except in cheapening certain classes of traffic, as the interests of the companies have led them to do so?—I think there is no doubt that those amalgamations have greatly tended to a gradual reduction of the fares and rates.

4356. Your proposal, rather, is to avail yourself of Government aid in amalgamating the Irish railways, and to obtain a large reduction of the fares charged for third-class traffic and of the rates charged for the coal traffic at once?—Yes.

4357. Do you propose that the limited company should pay a sum equal to the present net receipts?—No; it is to be a subject of tender; they might offer more, I think, if put up to competition; you might get a larger offer than would be equal to the existing net receipts.

4358. How would you deal with the extensions made by this proposed company at the end of the lease?—The new company would make the extension.

4359. Out of the capital that it would raise?—Yes; out of the capital which they would raise, and it would become then a charge upon the revenue; a permanent charge; but they would be relieved by a part of that being converted into a terminable annuity and part into ordinary stock at the expiration of the lease.

4360. You mentioned that, in proportion to the extension of the traffic, for every 100,000*l.* produced by increase of traffic there should be put upon the railways new rolling stock to the extent of that amount?—Yes; I should limit them to that.

4361. The new company would put that on out of their own capital?—Yes; out of their own capital; but then at the expiration of the lease they would be paid that in the valuation of the stock which they gave up; they might be entitled, as against the estate, to 100,000*l.* for rolling stock, if they had put it on, but not more than that.

4362. All the rest beyond that must be charged against the fund?—Yes.

4363. You mentioned that in the case of a colliery in which you were interested in North Staffordshire the London and North-western company gave you rates for coal, that would not enable you to carry it to London; will you just explain that a little?—We travelled I believe for a distance of about 16 miles on the North Staffordshire line, and this company said, it is not worth our while to take your coal unless we have a terminal and charge a certain rate; the North-western Company charged us the same mileage as from Wigan, viz., a halfpenny a ton, and that halfpenny a ton would represent 36 miles as against our 16 on the North Staffordshire; but then the North-western company made their terminal charge, so that we had two terminal charges to pay, besides a higher mileage rate on the North Staffordshire, and the result is, that the Wigan coals, although much further distant from London, have a preference. But I make no

complaint of that, they are different and separate companies.

4364. You propose for the short traffic in coal on the Irish lines a terminal change of *5d.* ?—Yes.

4365. You also propose a rate of three-eighths of a penny per ton a mile, whereas the rate between Peterborough and London, a distance of 100 miles, is a farthing a ton per mile ?—We charge 124 farthings and *5d.* for terminals ; *2s. 7d.* is the cost exclusive of *5d.* for terminals.

4366. You referred to the circumstance of coal coming into use in Norway in preference to wood ?—Yes ; I have known families in Norway who, whenever they can get coal, use it in preference to wood.

4367. (*Mr. Hamilton.*) How do you propose to accomplish the purchase of this railway stock for the Government ; what legislative form would it assume ?—Very much the same as an Act of Parliament to make a railway. Power should be granted to buy up the whole of the existing lines upon certain terms to be found in the Act. The only thing open to discussion would be the ordinary stock, that is the only real difficulty, for there is a prospective value attached to that, and perhaps there ought to be some court of arbitration to adjust the claims arising out of that.

4368. Would you consider the directors entitled to compensation for the loss of their places ?—I dare say they would get it ; but I do not think that they would be entitled to it.

4369. Do you think that they would receive compensation under Parliamentary sanction ?—I dare say the result would be that they would get something. In amalgamations which take place in this country, it is quite a usual thing to provide for officers of long standing, such as the secretary and others.

4370. Is it not the case that in amalgamations in this country the terms are agreed upon between the companies, and they go to Parliament to ratify the agreement ?—Yes.

4371. That would not apply in the case under consideration ?—No.

4372. Therefore there would be a great difference between the step which Parliament would have to take in this case and what is usually done in cases of amalgamation in this country ?—This is quite abnormal.

4373. Have you made any calculation as to the actual amount of annual saving that would be effected by the proposed consolidation of the Irish railways ?—It is impossible to make any, unless I went personally through the whole of the accounts of the Irish railways, and saw the stock, and examined everything in detail, I could not give you that information ; but I know, in the nature of things, it must be very large.

4374. On reference to the returns of the Board of Trade, it does not appear that the per-centage of the working expenses on Irish railways is materially larger than that on English railways ?—No ; but I do not think that all their expenses in that respect are brought in yet ; they have not come upon them ; that is to say, the charges on the permanent way cannot have been ascertained and set down at their fair average.

4375. I observe in this return before me that the charges are much larger in Ireland than they are in England ?—You must take it per mile ; it is under *100l.* a mile now ; it does not matter what the traffic is, there will be charges upon the permanent way ; the sleepers consist of timber, and they will decay, and whether you have a large traffic or a very small one, does not materially affect it.

4376. Then there is another allowance to be made, the per-centage is apparently the same, but the English railways are charged with a Government duty of nearly three per cent., from that the Irish railways are exempt ?—Yes.

4377. If that were taken off, that would make the per-centage in the Irish system larger than it is in the English system ?—By that amount, no doubt.

4378. Have you any reason, looking at the traffic, for saying that the rolling stock which the Irish railway companies now possess is inadequate ?—No ; judging by the number of the engines, I should say it was adequate. They have rather more engines than we have ; they have 390, and we have done the work with 330.

4379. On what grounds would you lay down, as a general rule, that you would carry coal at three-eighths of a penny a ton per mile ?—I should do that for this reason, that at present it is the rate which the Great Northern company charge, and it is the rate, I believe, which the Great Western company are arranging with the coal owners of South Wales to bring coals up for, and it is the rate which applies to very large quantities of coal that are carried in this country. Undoubtedly it ought to be a higher rate in Ireland than in England, because the quantities will not be equal to those which are carried in England, but the object would be to stimulate the industry of the country, and I think there would be great moral advantages result from the diffusion of coal throughout that country.

4380. If you had to fix a rate on a railway, would you not rather be induced to look to the peculiar circumstances connected with that railway ?—Yes.

4381. What would those circumstances be ?—If you were to let to me these railways without any restriction, I think that, in all probability, I should charge a higher rate than three-eighths ; but if, for the purpose of advancing the country and stimulating enterprise, the State thought it desirable that three-eighths of a penny should be the limit, then I say that you can enforce that rate, and I believe you can enforce it without any charge being brought upon the State, and still afford to the Irish public that advantage.

4382. How do you think you could induce the company you propose, to undertake to act upon such terms unless, upon investigating the circumstances of the railways, they found that that rate would be profitable ?—*Quoad* the coal it might not be profitable ; but when you see that the whole of the mineral traffic of Ireland is represented by 234,000 tons, it is a mere bagatelle, and the loss upon it could not be large ; whereas the general increase would, in my opinion, be very large.

4383. I thought that one of the items upon which you particularly calculated was an increase in the coal traffic ?—Yes, and minerals in general ; but when you put it to me, whether the parties going to lease these railways would be satisfied with three-eighths of a penny per ton, I say that I do not think they would ; but if it were forced upon them, it would have no great effect upon them, because the existing traffic to which it applies is so very minute.

4384. On the one hand, you say that the loss would be small because the traffic is small ?—Yes ; the existing traffic, and if it did not grow, the loss would not be much ; whereas the probability is, that if everything were brought under one management, that traffic would swell greatly.

4385. There is no instance in this country of a lower rate than three-eighths of a penny per ton per mile for coal traffic, and only as low as three-eighths of a penny where there are full trains and favourable gradients ?—From Peterborough we have to pay 124 farthings for 100 miles ; we have full trains, and we have only one exceptional gradient between Peterborough and London.

4386. You quoted an instance in which some arrangement was likely to be made between the Great Western company and another railway company ; do you know the gradients on that line ?—The gradients are favourable, but not so favourable as we have on the Great Northern.

4387. You have not got such gradients as 1 in 400 in Ireland ?—No ; and that is the reason why I propose to fix it at three-eighths of a penny.

4388. And that is the rate which the Great Western company have assented to carry the coal for ?—Yes.

4389. The gradient between Swindon and London

Mr. G. P. Bidder.

30th May 1865.

is extremely favourable?—Yes; but there are some heavier gradients.

4390. There is a line upon which the most unfavourable gradient is 1 in 200?—Yes, that is the Great Northern gradient.

4391. It has been represented to the Commission by many of the Irish witnesses that the traffic of the country is a fixed quantity, and that there is really no prospect of any material increase even under the inducements held out by lowering the fares; that is not your opinion?—I do not believe in that; on the contrary, I am certain that if the whole of the Irish railways were under one management, traffic would grow up throughout the country that nobody has any notion at all of; and if you could quote a rate for the transport of materials and produce according to the fluctuations of the market, I am certain that freight would arise and other sources of traffic and income present themselves of which there is no appearance now.

4392. The same thing might have been said before the days of railways as to the traffic of this country?—Yes. In the Great Eastern district we have increased at the rate of about 80,000*l.* to 100,000*l.* a year in agricultural produce, but the increase was arrested for many years before additional facilities were given and the charges were lowered.

4393. (*Mr. Glyn.*) With regard to your limited company, you propose that they should raise a capital of 1,000,000*l.* and call up 500,000*l.*?—Yes; and of that 500,000*l.* 250,000*l.* should be invested as security, and the other 250,000*l.* I think the company should have for the purpose of improving the stations and as capital in trade. If they laid out 100,000*l.* in improving the stations and in increasing the rolling stock to be put on to the lines, that would become a security to the State.

4394. You would use the other 250,000*l.* to increase the working stock?—Yes.

4395. Would all that be repaid to them when everything was valued at the end of the lease?—Yes; subject to this, that they could not compel the State to take more rolling stock than they had when they took the lease, and that would be represented by the gross revenue.

4396. The quantity put upon the railway which they ought to be paid for, would be measured by the quantity of new traffic that they brought upon the railway?—Yes.

4397. With regard to the arrangement that you alluded to, and which was made with the Caledonian company, if I remember rightly the assent of all parties was obtained before any reduction was made in the charge upon the preference stock?—Yes, but I think it was rather upon compulsion, although the consent was obtained.

4398. I understood you to say, that the annuity of $4\frac{1}{2}$ per cent. was to be an annuity for 43 years?—Yes.

4399. (*Mr. Lowe.*) Is it essential to the working of your scheme, that the State should be the purchaser of these railways?—I do not see who else is to do it.

4400. You follow the analogy of a Bill compelling sales of land, putting the State in the place of a company?—Yes.

4401. You do not think that it would be possible to get a company that would have the requisite capital?—I am not certain that you could not. It would be possible that a company might be formed to buy up the whole of the railways in Ireland upon certain terms being defined, but I do not think that by such a plan you could secure the eventual advantages to the country, that the plan which I suggest would secure; because my plan contemplates the absolute absorption and annihilation of all the permanent charges.

4402. You assume that a company could not borrow on as easy terms as the Government?—The Government would lend the money, or lend their credit.

4403. Would you rather have the Government directly, or the Government supported by a company?—I am sure that it would be better in the hands of the Government. The only question would be what Department should carry it out.

4404. You propose that the Government, when it had completed this purchase, should lease the line to a company to be established for that purpose?—Yes.

4405. What powers do you propose that the Government, as reversioners of this property, should retain in its own hands?—None, during the lease, except that having leased the line upon certain covenants, the Government should have the power to see that those covenants were fulfilled.

4406. What sort of covenants do you contemplate would be insisted upon by the Government?—In the first place there would be a covenant restricting the rates, providing that the existing rates should be the future maximum; that upon certain exceptional articles reductions that might be determined hereafter should take place; that there should be the daily train I have referred to; that the existing train facilities should be continued, or increased facilities substituted for them. It should be provided that the alterations should not be in reduction of the facilities but in multiplication of them. Then there would be the provision that I have mentioned with respect to the rolling stock, and the provision with regard to the permanent way.

4407. With regard to the maintenance of the permanent way, what arrangement do you contemplate?—With regard to the maintenance of the permanent way, a fund should be established by the company paying over to the Government weekly or quarterly a rate equal to five-eighths of a penny per train mile, so that when 10,000*l.*, or 15,000*l.*, was required to be expended in new rails, it should be taken out of that fund.

4408. The enforcing of the performance of those covenants would involve some legal questions, would it not?—Legal questions would no doubt arise.

4409. How would you propose that those should be decided?—My own notion about it is, (but the Commissioners are far better capable of forming an opinion upon it than myself,) that, looking at the delays involved in an ordinary arbitration, the legal questions that would arise, would have to be left to some high legal authority in Ireland, probably the Lord Chancellor or the Chief Justice.

4410. Do you mean such questions as whether people were receiving the accommodation which the Government had stipulated?—No, only legal questions.

4411. Suppose one covenant said that people should have such accommodation as they had before, and the Government insisted that the accommodation that the company were giving was not the same, while the company contended that, substantially, it was the same, would you call that a legal question?—That would be a matter of fact. There would be questions of law involved, and also questions of fact. There would be first the legal question as to the construction of the covenants which would have to be settled by high legal authority. Then there would be the mechanical questions, How is the permanent way kept up? Is the rolling stock properly kept up? The machinery for the determination of these would be the lessees appointing an engineer, and the Government appointing an engineer, who should settle it, or in the event of their not agreeing, an umpire to be appointed between them should settle it. The Government would appoint whom they liked, then the lessees would appoint whom they liked. Then comes the commercial question. I think that might be left to two commercial men, one to be appointed by the Government and one by the lessees.

4412. What do you call the commercial question?—Any question as to whether there had been a breach of the stipulations with regard to rates, or whether arrangements were being made with regard to traffic which might be contrary to any of the covenants in

the lease; such questions should be settled by commercial men.

4413. Appointed in the same way; one arbitrator being appointed by the Government, and the other by the lessees, an umpire being appointed in case of difference between them?—Yes.

4414. Those exhaust all the questions which you foresee would arise?—Yes. Then the question arises, who is to put all this in motion. There must be some department of the State to receive the rent, and to audit the accounts; because, of course one of the covenants would be that a statement of the receipts of the railway should be furnished to the Government annually.

4415. The Treasury would be the proper department to receive public money, would it not?—I am not able to speak to that.

4416. With regard to the accounts, they would have to be investigated, would they not?—Yes.

4417. Who would you propose should do that?—The department would order it to be done by some public accountant; some London accountant would probably be sent down.

4418. Do you contemplate that there would be any chance of competition for such a lease as this?—Yes.

4419. You propose that tenders should be invited for it?—Yes.

4420. Do you think that one board could manage 1,700 miles of railway?—Yes, very easily.

4421. Is there any instance of such a thing at present?—The London and North-western system is 1,200 miles, I think, but then their revenue is 100,000*l.* a week. It is a much more complicated system than the Irish, because the different companies are so much interlaced with each other, and constant contests arise.

4422. Do not you think that your proposal has this weak side, that it would operate unfavourably as to the creation of new railways in Ireland?—It might so operate; unless properly guarded it would have that effect.

4423. The State would be rather disposed to support its lessee?—It would.

4424. Taking the analogy of France, we know how difficult it is to get a new concession, the State and the present concessionaires uniting against any one applying for another concession?—Yes; I see that there would be that difficulty.

4425. How would you guard against such a difficulty in the case of Ireland?—In the first place I should propose that this company should be bound by covenants in the lease to work any new line that was really required, projected by any party, that they should not divert from that line the traffic for which it was designed, and that if they did they should be accountable. I think with those covenants, where lines were really required, the parties for their own interests would promote them.

4426. Would it be possible to put any covenant in the lease to the company, stipulating that they should work those new lines to the satisfaction of any independent body?—The covenants of the lease would embrace such a provision.

4427. Such a body as the Board of Trade?—They should be bound to work them efficiently, and if they did not work them efficiently, the arbitration clause which I have already mentioned, would come into play.

4428. You propose that the term of the lease should be renewed every ten or fourteen years?—Yes.

4429. Do not you think that there would be a very awkward pressure put upon the Government by Irish gentlemen, when that time came round?—No; they would have no power to interfere, the lease would be renewed, and the terms would be arranged according to the receipts of the last year.

4430. It would be according to something that worked itself; it would not be discretionary with the Government?—No; the reason why I propose a short time is, because many people would be willing to go into such a venture if it were terminable at the end of ten years, who would not like to go into it for a long time, unless it could be revised.

4431. With regard to the maintenance of the permanent way, you would rely upon the covenants in the lease?—Yes. I would make it their interest to keep up the road, because the money that would accumulate as a renewal fund, would be more than would be necessary to renew it.

4432. The company would gain nothing by saving anything within that fund?—No, they would lose.

4433. So that practically it would be spent on the permanent way?—Yes.

4434. You think it possible to estimate what it would be?—Yes, to within a fraction of a farthing, it would be five-eighths of a penny, or at the most three-fourths.

4435. Have you ever known an instance where the figures you have put were practically worked out?—I know an instance where the calculation as to rolling stock worked out satisfactorily at the end of a ten years lease, the parties who had worked the line and the parties who had leased it being both satisfied at the end of the contract.

4436. (*Sir R. Hill.*) You propose no general reduction of rates?—No.

4437. You would leave it to the company to charge any rates not exceeding the present rates that they may think most profitable with certain exceptions?—Yes.

4438. You said that in the natural course of things the traffic must increase. You are aware of course that the population of Ireland has for several years been decreasing?—Yes.

4439. Do you think, supposing that decrease to continue, there would be an increase of traffic under the arrangement you propose?—Yes, I think so. Of course there would not be that increase which takes place with a growing population, but the traffic of the population that would exist would become developed and enterprise would be excited. They would travel a great deal more and produce more to be carried. The land would be cultivated to a greater extent, and so the traffic would be increased. The population in our agricultural districts is stationary, and in fact decreasing, though the traffic has increased.
